The Hermann M. Biggs Memorial Lecture, which is held annually in Hosack Hall at the New York Academy of Medicine under the auspices of the Committee on Public Health Relations, will be delivered this year on April 6 at 8:30 P.M. by Wilber A. Sawyer, M.D., director of the International Health Division of the Rockefeller Foundation The subject of Dr. Sawyer's address will be "International Health."

This lecture is open to the general public

year fifty-six public health nurses made 3,269 visits to cancer patients, exclusive of those made by the Cancer Committee's nurse.

During this period the Committee's nurse was serving as a liaison officer between the tumor clinic and the nurses of the health department and voluntary agencies, acting as a consultant in the more difficult cases and securing help for the clinic from the other groups as needed. So in a very real sense the Committee played a part in most of these visits.

With the nursing work being so well taken care of, the Committee's own nurse is now devoting part of her time to the organization of groups of volunteers, under the sponsorship of the Women's Field Army, who will collect old linens, salvage them, and make them into dressings to be given to cancer patients for use in their homes. This project is modeled after the splendid program developed by the New York City Cancer Committee. Far from being in conflict with the work of the Red Cross in preparing surgical dressings for the armed forces, this program, by salvaging and utilizing waste materials, is actually one of our contributions to the war effort.

Meanwhile, the Committee had not entirely neglected its responsibilities in educating the general public. As our other "tools" for cancer control began to develop in adequacy and usefulness, we gradually expanded these efforts. In 1937 a high school teacher who had heard one of our speakers address an adult audience invited us to send the same speaker to deliver the same lecture to her high school science club. With much misgiving, but at her earnest solicitation, we determined to make the experiment of talking about cancer to a group of adolescents. The results were surprising. The speaker reported that there had been more questions-and more intelligent questions—than he had ever been called upon to answer in all the cancer work he had done. Encouraged by similar experiments being made by the Cancer Committees of Westchester 1.5 and Suffolk counties in New York State and elsewhere in the country, our Board decided that work in the schools presented an opportunity which was more valuable than we had realized.

The financial situation of the Committee had improved to the point where we could now afford the services of another employee, and we decided that the new member of the staff would not be another nurse, as had been planned, but rather a person who could organize and conduct an expanded educational program for the general public.

Just as we had always left the education of the medical profession to the doctors themselves

and had utilized the services of our public health nurse to assist the doctors in bringing cancer education to the nursing profession, we determined that our public educational work must be done by a trained educator. Obviously such a person must have a background of scientific knowledge and training in public health education, but she also should have had training and experience in classroom teaching if she hoped to receive the respect of the teachers and of the school administrators. We found this combination of training and experience, and engaged the services of our first Director of Education in 1939.

After a preliminary survey of the cancer education work being done in other parts of the country, a public opinion poll was made of something over 4,000 people. When the results were compared with the figures published by Dr. Gallup and others, we found that while the general level of cancer knowledge in the county was higher than might have been expected, there was still plenty of work to be done. In spite of improvement in the stage of the disease existing in patients coming to the tumor clinic and reported to us by private physicians, the doctors at the clinic were still complaining: too late, too late, too late, too late.

Realizing that we could not hope to reach all the people in the county at one time, or by using any one method, we decided to approach the more accessible groups first, through speakers sent to regular meetings of existing organizations. During the past four years we have presented some four hundred such meetings to a combined audience of 37,000 people. But that isn't even a tenth of the total population of the county. Posters, exhibits, printed material, newspaper stories, added to the formal meetings, still do not reach all of the people. There is probably only one place where eventually most of the public will be reached, and that is in the public schools.

While developing the other phases of our educational program, therefore, we began the preliminary work of getting cancer education into the secondary schools. In 1939 we secured the assistance of a physician who had formerly been a high school principal and we started giving cancer programs before high school assembly sessions. The interest aroused among the pupils was such that several of the teachers asked for source material and teaching aids for use in their science classes. This resulted in the preparation of a tentative teaching outline which was distributed in mimeographed form in 1940.

After about two years nearly every high school in the county had had at least one assembly program on cancer and a significant practitioners who would be willing to utilize the services of this specialist group.

Probably the greatest step along this line was taken in 1933 with the organization of the Nassau County Tumor Clinic. This was a cooperative venture financed by the Cancer Committee, staffed with the help of the medical society and the local hospitals, and housed, temporarily, in a wing of the county tuberculosis hospital. From the start of the clinic the maximum possible use was made of the teaching opportunities it afforded. Under the direction of an able and enthusiastic consultant, and with the assistance of some of the staff of Memorial Hospital in New York City, the clinic held a weekly teaching conference where interesting new cases were presented for discussion and patients were shown for the follow-up observation of treatment.

How well this clinic and its teaching conferences succeeded in arousing the interest of the medical profession can be gathered from the fact that on the coldest day in the history of Long Island a session of the conference addressed by a prominent New York specialist induced no less than seventy-five doctors to drive to the farthest margin of the county over ice- and snowblocked roads. This was just five years after our humiliating experience, when we confronted another New York visitor with an audience of three doctors and two nurses. Another significant sign of the progress we had made is contained in the figures on admissions for the first year of the clinic. The clinic saw 353 new patients. Fifty of these were transferred from other institutions; the remaining 303 patients were referred to the clinic by one hundred fortyone physicians and three dentists.

The tumor clinic is now the tumor service of Meadowbrook, the county general hospital. The teaching conferences are still being held, and up to the outbreak of the war they were attracting a weekly attendance of forty-five doctors. When the loss of doctors to the forces caused a demand that medical meetings be cut to an absolute minimum, spontaneous requests from many physicians kept the conferences from being discontinued. At present they are scheduled for once a month, but the attendance and the interest still hold up in an encouraging fashion.

Almost as soon as we opened our clinic we discovered the need for follow-up work and home visits. This work involved a great deal more than a mere tracing of patients who had missed appointments to return to the clinic or a visit to convince the family that they must take back into the home a patient who was no longer under active treatment but who was occupying a bed needed by a patient for whom surgery or radium was urgently required. To be sure, that was

our first conception of follow-up work, but fortunately we were well advised and secured the services of a trained public health nurse for this service. It soon became apparent that this nurse was doing a real job of social service as well as of nursing. Because we could afford to hire only one nurse, she was forced to seek the help of other community agencies to secure bedside nursing care, financial assistance from the welfare department, perhaps coal, food, or clothing from some private agency, or some kindly neighbor who would stay with the children while the mother came to the clinic for examination or treatment.

When the clinic was taken over by the county hospital, the Cancer Committee loaned its public health nurse to the social service department of the hospital and with her help the clinic during its entire ten years' history has maintained an admirable record of continuous follow-up and observation of all its patients.

With the organization of the county department of health in 1938 we sought the assistance of its division of nursing.<sup>2,3</sup> It was agreed that before these nurses took over the burden of caring for the cancer patients in the home and the follow-up work for the Tumor Clinic they should be given an opportunity for postgraduate training.

A series of nineteen lectures was arranged by the staff of the Committee and the consultant to the Tumor Clinic. These lectures were given in sixteen consecutive weeks by members of the professional staff of the clinic. Attendance was requested of the health department's nurses, and an invitation was extended to the nurses employed by the various voluntary agencies of the county, including the insurance companies.

We were gratified at the attendance. Practically every public health nurse in the county registered for the course; nearly all of them attended every session.

Following the formal lectures, each nurse was given eight days of additional training in the hospital under the direction of the Committee's nurse, with the assistance of the professional staff of the hospital. Here they learned about the tumor service from the social service department and admitting office to the autopsy room and pathologic laboratory. They worked on the wards, helped in the outpatient clinic, observed the administration of radium and x-rays, and absorbed much of the philosophy of the institution as well as a knowledge of its problems and of the importance of attention to detail in cancer control work. While cold figures never can give a true picture of the importance of such a project, it is interesting to note that last

#### CANCER REMEDIES

Even in the midst of war, purported cancer remedies continue to appear. The most recent flurry is concerned with an English preparation known as "H 11." This is an extract of urine that is supposed to have tumor-inhibiting properties. As usual, the earlier reports appeared promising but the later give

little, if any, hope that the substance is of value.

The material, prepared by Thompson, 1,2 has been utilized by several groups for therapy of both human cancer and induced as well as spontaneous transplantable cancer in animals.3,4 In one series of 51 advanced cases of cancer, 37 cases received dosages that might be regarded as sufficient for fair clinical trial. Among these, 11 died and the results were unknown in 5 cases. The longest period of survival was eighteen months. All the patients surviving, except two (who lacked biopsy proof of the presence of cancer) had some other form of therapy in addition to H11. In none of the cases in which H 11 was used did the growth disappear. There was a suggestion of slight clinical improvement in some cases, but this has often proved to be misleading in evaluating remedies.

The evidence seems to indicate that this urinary extract is without value as a therapeutic agent in cancer.-Editorial in New England J. M., Jan. 6.

#### BRAZIL AND UNITED STATES COOPERATE AGAINST INSECT-BORNE DISEASES

Brazil and the United States have broadened their cooperation in the field of health and sanitation to include measures to prevent the spread of insect-borne diseases from Africa to the Western Hemisphere.

These measures are in recognition of the hazards from insect-borne diseases as a result of greatly increased wartime air traffic between African airports and Brazil, hopping-off place and arrival point for

heavy transatlantic air traffic.

Brazil is expected to designate two public health officers to act as liaison officers with United States Army authorities in African ports, under an arrangement made in a recent conference between Dr. Fabio Carneiro de Mendonca, of the Brazilian Ministry of Education and Health, and Lieut. Colonel Karl R. Lundeberg, of the Office of the Surgeon General, United States Army. The Brazilian doctors will work with United States Army officers on the sanitation of aircraft departing for Brazil from Africa.

This arrangement supplements the extensive cooperation between Brazil and the United States for control of malaria and other tropical diseases in the Amazon Valley and in the Rio Doce Valley, sources of strategic materials for Brazilian and United States industries.

Extension of malaria control measures in Brazil and other countries in Latin America is being carried out partly in recognition of the disease hazards resulting from the increase in air transport. Many new airports have been built in the Western Hemisphere in the last few years and air travel and freight is on the largest scale in history, augmented by transatlantic air travel by way of Brazil and Africa.

Airline operators anticipate continuation of inter-American air travel at a high level after the war. Many United States lines, in fact, have applied to the United States Civil Aeronautics Board for permission to establish new air services to Latin America after the war.-Release from the Office of the Coordinator of Inter-American Affairs

#### OUR RICE BETTER THAN JAPS!

Eating your rice cake and having your vitamins too is now possible because of a revolutionary method in rice milling. Millers in thirty-six countries are licensed to use this new method. Japanese mills are not licensed and, as far as we know, they still use the orthodox method. This is what happens (we hope) to Jap rice: Machines

first remove the husk, which contains vitamin Bi; then the germ and bran, which are rich in fat. minerals, and vitamin B complex.

By using the new method, the vitamin, fat, and mineral content of the husk and bran are transferred to the kernel before the rice is husked and polished.-Health and Nutrition News Letter

number of them had also made use of the tentative teaching outline. We then made a careful survey of the cancer education work being done in all the schools of the county and asked for suggestions from those schools which were using the teaching outline. The information thus secured was presented to a specially selected group of teachers, school administrators, and physicians, who prepared a revised outline which was published in printed form in 1942. We believe that this represents the first attempt made to give to secondary school teachers a complete teaching unit on this subject. A recent survey of those schools which had accepted our unit showed that it has been widely used and well received. It has also served as a prototype for similar units prepared in several other sections of the country, and we hope that these several experiments will eventually culminate in a truly complete unit.

The war has affected our program. We are no longer able to secure as many invitations to present programs to meetings of organized groups, and, of course, we are no longer finding it easy to secure the services of our doctor-lecturers. We have even been unable as yet to arrange the planned series of lectures to the science teachers who are using the teaching unit. On the other hand there is an increased amount of time being given to the teaching of health in the secondary schools, so the acceptance of our school program is perhaps easier to accomplish.

In our educational work we attempt to avoid distributing literature with complete information except to persons whom we know to be interested. Leaflets in banks, drug stores, and other public places include the "danger signals" and an invitation to seek further information from the Committee. When such requests are received, they are not answered by mail; the public health nurse makes a home visit to find the reason for the inquiry and to give detailed advice. Only rarely are these visits completely "wasted" and we have gotten into the hands of the physicians enough cases of early cancer to justify completely this personalized service.

What of the future? Well, we realize that we haven't even scratched the surface as yet, in spite of all the work we have done and in spite of the small measure of success we have achieved. The blueprint for the future, then, can be quickly drawn: more of the same.

Without question the most important part of our future program is the continuation of our educational activities both for the professions and the general public. Until every practicing physician makes the speculum and the endoscope as much a part of his regular kit of tools as are his stethoscope and his blood pressure apparatus

-or until he becomes willing to send every suspected case to a specialist for careful study-we shall continue to learn of missed cases of cancer of the body cavities and canals. As long as a single physician, dentist, or nurse tells a patient to "wait and see if it goes away," our hospitals will continue to admit patients with inoperable cancer of the breast, melanomas which have become disseminated to all parts of the body, and other similar tragedies. The "magic pill" for the treatment of sudden indigestion is just as dangerous in the doctor's office as it is on the radio program. The patient who has heretofore enjoyed good health, who suddenly develops indigestion which does not yield promptly to treatment, is at least entitled to careful examination, not forgetting the possibility of x-rays.

The public educational program should continue to expand and should become both more specific and more personal. We have come to the conclusion that it is of more value to discuss cancer in an intimate fashion with a small group than to depend upon more formal lectures before large audiences. A hundred women duly overawed by a lengthy scientific exposition might remark to their friends that they heard a marvelous lecture on cancer, but ten women who have been really instructed and indoctrinated in a small discussion group will begin sharing their knowledge with their friends and will start giving specific advice to "see your doctor" when they learn of a definite situation. We are pleased that our medical friends in the county agree that results are beginning to show.8, 10

A prominent surgeon—not in Nassau County is very proud of his ancient cliché that "you can't cure cancer by advertising," and uses it to justify his opposition to an organized cancer education program. Not long ago this same surgeon, in an address to a medical group, complained that patients were not coming to him early enough in the disease. Let's admit that you can't cure cancer by advertising, but let us also point out to him that he, in turn, cannot cure late cancer. Whether you call it health education, propaganda, or advertising, the only way by which the surgeon will get patients at a time favorable for therapy is by finding some way to reach both the potential cancer patient and the practicing physician, and to make them realize, in a way they will never forget, that the thing most to be feared about cancer is delay.

# LOS ANGELES COUNTY NEEDS DOCTORS FOR CIVIL SERVICE POSITIONS

Physicians, M.D., Anesthetists, M.D., and Residents, M.D. (Otorhinolaryngology) are wanted for positions in the Los Angeles County General Hospital and other County institutions, according to an announcement made by the Los Angeles County Civil Service Commission.

For the \$290 to \$344 a month positions as Physician, M.D., and Anesthetist, M.D., candidates are required to be graduates of an approved medical school, to have appropriated at least pine months' school, to have completed at least nine months' internship in an approved hospital, and to be under 55 years of age.

Applications for the Residencies paying \$158 a month will be accepted from persons of all ages who meet the above requirements.

Candidates for all positions must submit with

their applications their photographs taken within two years and the names of two physicians qualified to evaluate their professional training and experi-

Candidates for the Residencies must submit in addition the names of the medical schools from which they graduated and the places, types, and duration of their internships and prior residencies. Applications for the Resident and Anesthetist

positions must be filed on or before March 11, 1944. Applications for the Physician, M.D., will be received until March 4, 1944.
Full information and applications regarding these

positions may be obtained from the office of the Commission, 102 Hall of Records, Los Angeles 12, California.

#### PRESCRIPTION AGAINST INFLATION

Berton Braley, New York City

THE toughest part of the problem of inflation is to make the individual realize that it concerns him, personally; that it isn't a vast abstraction expressed in billions but a matter affecting the family budget and the office accounts, intimately.

Some so-called "economists"—the lunatic fringe of them—pop up every so often with the assertion that a little inflation is a good thing. Which is like saying that a little blood poisoning

is a good thing.

But the cold historical fact is that inflation—little or big—has always lost money, security, and peace of mind for everybody.

And as a student of its causes and an observer of its effects, I can't help thinking that, of all professions, physicians stand to suffer most from the upward spiraling of prices.

The case of a doctor and of a doctor's cases would be pretty serious if the inflationary trend

really got to trending.

For doctors are notoriously slow in collecting their bills, or perhaps it's truer to say that patients are notoriously slow in paying them.

Either way, in a rapidly rising "spiral" of prices—which is inflation—the physician might find that, after waiting six months for payment of a hundred dollars' worth of services, his hundred dollars would buy only fifty dollars' worth of food, clothes, gas, or medical supplies.

Everything he bought for his professional work or his family living would advance on a similar scale. In other words, the dollar he collected would be worth half the dollar he charged.

Theoretically, he could double his charges, but practically a doctor's fees are not so elastic as all that. They're pretty well fixed by his professional reputation and his own business tradition. And even if he did raise his fees, he could never be certain—in a runaway inflation—that what he collected would be worth what he charged.

He could do a cash business? How many doctors have had that kind of practice since the days of Hippocrates—and I'm betting he didn't.

There is another way in which inflation would be tough on the physician—because it would be tough on his patients. The money that they would ordinarily pay him—at least eventually—would be entered in the losing race against rising prices, and the margin left with which to pay the doctor would shrink as the value of the dollar shrank. "Eventually" would be further away than ever, and the "buying power" of what the doctor got would be less and less.

The only benefit the physician might get out of his patients' struggle to keep even in an inflationary period would be an increase in neurologic cases, and treatments for price-shock. But that would probably be balanced by the loss of patients who felt they couldn't afford the cost of medical attention when food, clothing, and rents were so high.

Those are the special and peculiar ways in which the physician would suffer from inflation. And he'd suffer in the ordinary ways, too, like everybody else—his increased earnings, if any, more than absorbed by soaring prices, his savings and investments worth less because they would purchase less.

All right, that's what inflation would do to the doctor. What can the doctor do about inflation?

He can do about what he is doing.

Like most Americans, the physicians, without definitely realizing it, have been doing a splendid job in the fight against inflation. They have observed ration rules and price ceilings. They have bought economically and refused to rush into the market to compete for scarce goods. They have invested their surplus in savings accounts, life insurance, and war bonds, thus taking a tremendous amount of "dangerous money" out of the market for goods. They've paid their taxes and haven't boosted their charges to compensate for it.

What the doctor can do to prevent inflation is to carry on in that same economical, provident way. So long as the doctor keeps that up, along with the rest of the workers, he won't need to worry much about "runaway inflation."

Basically, it's the individual who decides whether we have inflation or not, and if the individual doctor, like the individual layman, continues to fight inflation by "holding the line" or his part of it, personally, then "it won't happen here."

The average human heart, weighing about onehalf pound, generates enough energy in twelve hours to lift a tank car of 65 tons one foot from the ground.—Science News Letter

# Medical Legislation

Bulletin No. 4 Issued by the Legislative Bureau of the Medical Society of the State of New York, February 24, 1944

ON FEBRUARY 23, Senator Seelye and Assemblyman Brees introduced a chiropractic bill. It is an amendment to the Brees bill of 1942. principal amendment authorizes the Regents to create an examining board to be composed of four chiropractors and one physician. It further provides that all persons who are now practicing in the State and have been bona fide residents of the State for at least one year, may take a special examination in the principles and practice of chiropractic and those who successfully pass it shall be licensed to practice chiropractic. After 1949 the qualifications for entering the examination must be that the ap-plicant shall have had a high-school course and two years of study in a registered college of liberal arts and shall have graduated from a school or college teaching chiropractic registered by the Department of Education. The course of study shall include not less than 3,600 hours in the following subjects: 'iemistry, hygiene, pathology,

chiropractic analysis, x-ray as it relates to chiropractic analysis, and the principles and practice of chiropractic. The examinaciples and practice of chiropractic. The examina-tion for the last three subjects shall be conducted by the chiropractic members of the Board alone.

It will be said by the chiropractors and their supporters that this bill requires an examination of every chiropractor before he becomes licensed and that the bill has no waiver clause. This is only partly

As you will observe, the examination that the present practitioner must take does not include the subjects of anatomy, physiology, chemistry, hygiene, pathology, bacteriology, or diagnosis, but is limited entirely to an examination in the technic of chiropractic; that is, in other words, the State will have no assurance from an examination and licensure under this bill that the applicant is qualified to recognize any disease or pathologic condition other than, probably, a subluxated vertebra. The chiropractor's office will be open to all sick people and from the sign on the door the sick person will not know that the chiropractor is not so well trained and qualified to diagnose his illness as any physician whose advice he may have sought.

It is surprising or significant that the chiropractors did not wait until the committee appointed by the Legislature for making a study of chiro-practic laws could submit its report. As soon as the bill is printed we shall see that a copy of it goes to each chairman of the county committees and we shall have extra copies for those who may want

especially to study it.

This is an exceedingly important matter and we urge that you give it your immediate careful atten-May we suggest that you ask your legislators, both senators and assemblymen, to use their influence in having the minutes of the chiropractic investigating committee printed. Stenographic minutes were taken at each hearing and copies of these are in the hands of the members of the committee, but no one else. Each legislator should have the privilege of looking over those minutes and seeing for himself what was said by the chiroprac-tors the physician and the learners who appeared tors, the physicians, and the laymen who appeared before the committee.

Other Bills Introduced

Senate Int. 426-Baum, repealing provision for State aid to tuberculosis patients. Referred to the Finance Committee.

Comment: Same as Assembly Int. 461—Stuart, reported in Bulletin 3.

Senate Int. 427—Baum; Assembly Int. 623-Stuart, provides that the State Health Commissioner shall cause to be made, instead of shall make, examination and inspection of sanitary conditions of State institutions and furnish a report to the department head instead of to the president of the board or other authority in charge of the institution, and to the Standards and Purchase Division. Referred to the Health Committees.

Senate Int. 428—Baum; Assembly Int. 622—Stuart, strikes out the provision that local boards of health and health officers shall provide suitable places for treatment and care of persons with infectious and contagious or communicable diseases, who cannot otherwise be provided for. Referred to the Health Committees.

Comment: Deletes the provision that the Department of Health shall provide places for treatment, since the Department of Social Welfare now has charge of the treatment of all cases. Since this provision was made in the law, the Department of Social Welfare has been given the responsibility of the care of sick persons who cannot otherwise provide for themselves, and to have the same provision in two laws may occasion duplication and confusion.

Senate Int. 463—Duryea, relative to the removal of fire and health hazards from property. Referred

to the Internal Affairs Committee.

Comment: Same as Assembly Int. 552—J. D. Bennett, reported in Bulletin 3.

Senate Int. 523-Joseph, established in the Education Department two State victory medical colleges, to be equipped for instruction for 4,000 students each and to be located on sites to be selected by the education commissioner, which may be adjacent to a State hospital; Regents shall provide for five tuition-free scholarships, in number equal to five times the number of senatorial districts; \$10,000 is appropriated for selection of sites and \$50,000 is allocated from postwar reconstruction fund for plans. Referred to the Finance Committee.

Senate Int. 589-Seelye; Assembly Int. 813-Brees, chiropractic bill described above. Referred

to the Education Committees.

Assembly Int. 602—Pillion, relative to persons inducted into military service who are licensed to practice medicine. Referred to the Education

Comment: Same as Senate Int. 371-Burney, reported in Bulletin No. 3.

Assembly Int. 706-Mitchell, regarding purchase of oleomargarine or other butter substitutes. Referred to the Agriculture Committee.

Comment: Same as Senate Int. 381-Wicks,

reported in Bulletin 3.

#### Tropical Medicine

LECTURE entitled "The Present and Postwar A Importance of the Malarias and the Dysenteries" was given before the Cortland County Medical Society, at the Contland County Hospital in Cortland. This meeting was held on February 18 at 8:30 P.M.

Dr. Barton F. Hauenstein, assistant professor of medicine at the University of Buffalo School of Medicine, was the speaker.

This instruction was presented as a cooperative

endeavor between the Medical Society of the State of New York and the New York State Department

On Friday, March 17, 1944, 8:30 P.M., at the Cortland County Hospital, the society will hear "The Diagnosis and Treatment of Anemia," a lecture delivered by Dr. Ellery G. Allen, associate professor of clinical medic of clinical pathology at - . lege of Medicine.

#### The Neuroses

A SINGLE lecture has been arranged for the St. Lawrence County Medical Society. "The Neuroses: Related to the Manic-Depressive Constitution" will be the title, and the speaker will be Dr Foster Kennedy, professor of clinical medicine (neurology) at Cornell University Medical College of Many York City. SINGLE lecture has been arranged for the St. in New York City.

The meeting will be held on March 9, 1944, at

1:30 r.m., at the Hepburn Hospital Nurses' Home in Ogdensburg.

The same lecture, "The Neuroses: Related to the Manic-Depressive Constitution," will be given by Dr. Kennedy at a meeting of the Jefferson County Medical Society on March 9 at 6:30 PM The meeting will be at the Black River Valley Club in Watertown.

#### Penicillin Therapy

JOINT meeting of the Onondaga County A Medical Society and the Syracuse Academy of Medicine will be held on March 7 at 8:30 P.M. at the University Club, Syracuse.
Dr. James E. McCormack, instructor in medicine

at New York University College of Medicine, will give a lecture entitled "Penicillin Therapy." This instruction will be provided by the Medical Society of the State of New York in cooperation with the New York State Department of Health

The DeLamar Institute of Public Health College of Physicians and Surgeons Columbia University

# Medical Legislation

Bulletin No. 4 Issued by the Legislative Bureau of the Medical Society of the State of New York, February 24, 1944

ON FEBRUARY 23, Senator Seelye and Assemblyman Brees introduced a chiropractic bill. It is an amendment to the Brees bill of 1942. The principal amendment authorizes the Regents to create an examining board to be composed of four chiropractors and one physician. It further provides that all persons who are now practicing in the State and have been bona fide residents of the State for at least one year, may take a special examination in the principles and practice of chiropractic and those who successfully pass it shall be licensed to practice chiropractic. After 1949 the qualifications for entering the examination must be that the applicant shall have had a high-school course and two years of study in a registered college of liberal arts and shall have graduated from a school or college teaching chiropractic registered by the Department of Education. The course of study shall include not less than 3,600 hours in the following subjects: anatomy, physiology, chemistry, hygiene, pathology, bacteriology, diagnosis, chiropractic analysis, x-ray as it relates to chiropractic analysis, and the principles and practice of chiropractic. The examinaciples and practice of chiropractic. The examina-tion for the last three subjects shall be conducted by the chiropractic members of the Board alone.

It will be said by the chiropractors and their supporters that this bill requires an examination of every chiropractor before he becomes licensed and that the bill has no waiver clause. This is only partly

As you will observe, the examination that the present practitioner must take does not include the subjects of anatomy, physiology, chemistry, hygiene, pathology, bacteriology, or diagnosis, but is limited entirely to an examination in the technic of chiropractic; that is, in other words, the State will have no assurance from an examination and licensure under this bill that the applicant is qualified to recognize any disease or pathologic condition other than, probably, a subluxated vertebra. The chiropractor's office will be open to all sick people and from the sign on the door the sick person will not know that the chiropractor is not so well trained and qualified to diagnose his illness as any physician whose advice he may have sought.

It is surprising or significant that the chiropractors did not wait until the committee appointed by the Legislature for making a study of chiropractic laws could submit its report. As soon as the bill is printed we shall see that a copy of it goes to each chairman of the county committees and we shall have extra copies for those who may want

especially to study it.

This is an exceedingly important matter and we urge that you give it your immediate careful atten-May we suggest that you ask your legislators, both senators and assemblymen, to use their influence in having the minutes of the chiropractic investigating committee printed. Stenographic minutes were taken at each hearing and copies of these are in the hands of the members of the committee, but no one else. Each legislator should have the privilege of looking over those minutes and seeing for himself what was said by the chiropractors, the physicians, and the laymen who appeared before the committee.

#### Other Bills Introduced

Senate Int. 426-Baum, repealing provision for State aid to tuberculosis patients. Referred to the Finance Committee.

Comment: Same as Assembly Int. 461—Stuart,

reported in Bulletin 3.

Senate Int. 427-Baum; Assembly Int. 623-Stuart, provides that the State Health Commissioner shall cause to be made, instead of shall make, examination and inspection of sanitary conditions of State institutions and furnish a report to the department head instead of to the president of the board or other authority in charge of the institution, and to the Standards and Purchase Division. Referred to the Health Committees.

Senate Int. 428—Baum; Assembly Int. 622—Stuart, strikes out the provision that local boards of health and health officers shall provide suitable places for treatment and care of persons with infectious and contagious or communicable diseases, who cannot otherwise be provided for. Referred to the Health

Comment: Deletes the provision that the Department of Health shall provide places for treatment, since the Department of Social Welfare now has charge of the treatment of all cases. Since this provision was made in the law, the Department of Social Welfare has been given the responsibility of the care of sick persons who cannot otherwise provide for themselves, and to have the same provision in two laws may occasion duplication and confusion.

Senate Int. 463—Duryea, relative to the removal of fire and health hazards from property. Referred

to the Internal Affairs Committee.

Comment: Same as Assembly Int. 552-J. D.

Bennett, reported in Bulletin 3.

Senate Int. 523-Joseph, established in the Educa-tion Department two State victory medical colleges, to be equipped for instruction for 4,000 students each and to be located on sites to be selected by the education commissioner, which may be adjacent to a State hospital; Regents shall provide for five tuition-free scholarships, in number equal to five times the number of senatorial districts; \$10,000 is appropriated for selection of sites and \$50,000 is allocated from postwar reconstruction fund for plans. Referred to the Finance Committee.

Senate Int. 589-Seelye; Assembly Int. 813-Brees, chiropractic bill described above. Referred

to the Education Committees.

Assembly Int. 602-Pillion, relative to persons inducted into military service who are licensed to practice medicine. Referred to the Education Committee.

Comment: Same as Senate Int. S71-Burney,

reported in Bulletin No. 3.

Assembly Int. 706-Mitchell, regarding purchase of oleomargarine or other butter substitutes. Referred to the Agriculture Committee.

Comment: Same as Senate Int. 381-Wicks,

reported in Bulletin 3.

Assembly Int. 740—Fogarty, provides that an employee mentally disabled as a result of an acci-

dent arising out of employment subject to workmen's compensation shall be entitled to receive medical care and maintenance in a public hospital or institution at the expense of the employer and without deductions from award. Referred to the Labor Committee.

Mr. Fogarty carried this bill in Comment:

1942. It died in committee.

Assembly Int. 768—Bormann, requires the Mental Hygiene Commissioner to provide for treatment and care of honorably discharged veterans of World War II who were discharged for mental deficiency and were residents of the State at the time of entry into the service and who are ineligible for hospitalization in U.S. Veterans' Administration Facilities because of nonservice connection; \$500,000 is appropriated. Referred to the Ways and Means Committee.

Assembly Int. 803—Crews, provides that junior professional service for civil service grades shall include practical nurses, instead of hospital nurses, and requires the salary standardization board to reallocate positions requiring training in graduate nursing to appropriate grade for professional serv-

Referred to the Civil Service Committee.

Assembly Int. 807-Milmoe, relating to the sale of eyeglasses, spectacles, lenses, etc. Referred to the Education Committee.

Comment: Same as Senate Int. 328-Young, reported in Bulletin 3.

Senator Coughlin has introduced a bill providing for the creation in the Executive Department of a tobacco control division to regulate and control the manufacture, sale, and distribution of tobacco products and to prevent adulteration by harmful and habit-forming drugs. He and Assemblyman L. Bennett have introduced a bill which would evtend unemployment insurance provisions to persons employed in the preparation and handling of food for human consumption in hospitals, educational, and religious institutions.

Senator Mahoney and Assemblyman Mailler introduced a bill postponing the effective date of the law enacted in 1942, requiring that hospital interns and clinical clerks be graduates of or students in schools approved by the State Department of Education, until July 1, 1945.

Committee on Legislation JOSEPH S. LAWRENCE Executive Officer

#### Announcement

#### Malpractice Defense and Insurance

The Council has directed that announcement be made to the membership that at its meeting on February 9, 1944, it adopted recommendations of its Committee on Malpractice Defense and Insurance that certain reductions in insurance costs under the Group Plan, and other changes, be made, which will become effective for all new and renewal policies dated on or after April 1, 1944. These have been recommended by the Society's insurance representative, Col. H. F. Wanvig, after review of the cost of operating the Malpractice Plan of the Medical Society of the State of New York for the eight years ending December 31, 1943.

(a) Reduction of the premium rate for the minimum policy of \$5,000/\$15,000 from \$32 to \$30.

(b) Reduction of the present table of percentages added to the base rate for limits in

excess of \$5,000/\$15,000 by approximately 10 per cent.

(c) Reduction of the present surcharge for cosmetic plastic surgery granted to members deemed to be professionally and ethically qualified for this specialty, from 50 per cent to 10 per cent.

(d) Reduction of the surcharge for x-ray therapy from \$30 to \$15.

(e) Reduction of the cost of a minimum policy for members serving in the armed forces from \$15 to \$9 but amending the coverage to provide that the company shall be liable only for suits and claims filed against the policyholder in the United States.

(f) Amending the policy contract so as to include protection on account of copartnership liability without additional charge.

Amplification of these changes will appear in the Annual Report of the Council, to be published in the April 1, 1944, issue of the New York State Journal of Medicine.

COUNCIL COMMITTEE ON MALPRACTICE DEFENSE AND INSURANCE

#### Medical News

#### Baehr Resigns as OCD Medical Chief\*

THE United States Office of Civilian Defense announces the retirement of its Chief Medical Officer, Dr. George Baehr, March 1, after two and a half years of service. He will be succeeded by Dr. W. Palmer Dearing, who has served as Assistant Chief Medical Officer since the establishment of the Medical Division of the Office of Civilian Defense.

Many months before the attack on Pearl Harbor, the Medical Division of the Office of Civilian Defense was assigned the responsibility for the protection of the civil population of the country and of its outlying territorial and insular possessions against the hazards of enemy attack and other wartime disasters.

In June, 1941, Dr. Baehr was authorized by the Surgeon General, U.S. Army, to resign a re-serve commission in the Army to accept a com-mission as Medical Director in the United States Public Health Service for assignment to the newly created Office of Civilian Defense to organize its Medical Division. Under his direction a staff of technical experts was assembled, Regional Medical and Sanitary Engineering Offices were established, and an Emergency Medical Service was organized in every state and local community throughout the country. An organization for protection against war gases was set up in the coastal states and in the major industrial centers in the interior, many thousands were trained in the technics of rescue work, and a program of passive protection and mutual aid for water supply systems and sanitation facilities has been established in all States.

Other achievements of the Medical Division include the establishment of a nation-wide system of Casualty Receiving Hospitals, 321 potential Emergency Base Hospitals in twenty coastal states, 180 hospital blood and plasma banks, reserve depots of dried and frozen plasma in 400 cities, more than 120 affiliated hospital units, each consisting of 15 physicians, surgeons, and specialists commissioned in the Reserve of the U.S. Public Health Service, and 80 emergency nursing units, each comprised of 22 nurses. At the instigation of the Medical Division and with its assistance, 150,000 Volunteer Nurses' Aides have been trained under the Red Cross for wartime volunteer service in hospitals.

In recognition of his services to the hospitals of the country in time of war, the American Hospital Association at its recent annual meeting voted a special citation to Dr. Baehr and elected him to

honorary membership.

On his retirement as Chief Medical Officer, Dr. Bachr will resume the professional and teaching responsibilities in New York City which he laid down when called to duty in June, 1941, in anticipation of the entry of the United States into the world conflict. He is clinical professor of medicine at the College of Physicians and Surgeons of Columbia University, chief of the First Medical Service at the Mount Sinai Hospital, New York, and a trustee of the New York Academy of Medicine. In 1915 and 1916, he served in the Balkans and in Russia as a member of the American Red Cross Sanitary Commission to combat epidemic typhus fever. After our entry into the last war, he was called into military service and served in France with the American Expeditionary Force as Commanding Officer of Base Hospital No. 3. He has served also in recent years as a member of the Public Health Council of the State of New York, the technical board of the Milbank Memorial Fund, the scientific board of the Institute of Public Health Research, and as Chairman of the Committee on Public Health Relations of the New York Academy of Medicine.

#### Piersol Is Director of New Physical Medicine Center

DR. GEORGE MORRIS PIERSOL, professor of medicine in the Graduate School of Medicine of the University of Pennsylvania, a past president of the American College of Physicians, and a member of the Council on Physical Therapy of the American Medical Association, has been appointed director of the new Center for Research and Instruction in Physical Medicine in the Graduate School of Medicine of the University, it was announced today.

To establish this Center the National Foundation for Infantile Paralysis recently made a grant totaling \$150,000 for a five-year period from January 1, this year, to December 31, 1948.

Dr. Piersol, whose appointment was announced by Dr. Thomas S. Gates, president of the University, will relinquish his private practice to direct the Center, one of whose objectives is to explore thoroughly the possibilities of physical means of treatment of the control o treatment, not only of infantile paralysis, but of other diseases as well.

The National Foundation for Infantile Paralysis and the University of Pennsylvania are most fortunate," said President Gates, "in obtaining the services of Dr. Piersol, who has a rich experience as a clinician and teacher, to head this Center, which is to study and teacher, and the control of the control of

train technical workers."

An alumnus of the College of Arts and Sciences and the School of Medicine of the University of Pennsylvania, Dr. Piersol joined the medical faculty at the University in 1907, and is now professor of medicine and a vice-dean in the Graduate School of Medicine, as well as professor of clinical medicine in the School of Medicine.

He is visiting physician to the Graduate Hospital of the University and chief of staff of that Hospital, active consultant in medicine to the Philadelphia

<sup>•</sup> Release from the Office of Civilian Defense.

General Hospital, medical director of the Bell Telephone Company of Pennsylvania, and former director of medical services of the Abington Memorial Hospital.

He is editor-in-chief of the Cyclopedia of Medicine, Surgery and the Specialties, editor of Clinics, and has contributed many articles to medical journals

and various textbooks.

In addition to being a past president of the American College of Physicians, he is secretarygeneral and a fellow of that organization. He is also a fellow of the College of Physicians of Philadelphia and of the American Medical Association, and a past president of the Philadelphia County Medical Society, the American Gastroenterological Association, and the American Clinical and Climatological Association.

During the first World War, Dr. Piersol was a lieutenant colonel and served for a time as commanding officer of Base Hospital 20, which was the University of Pennsylvania medical unit in that

war.

Later he became medical consultant to the Fourth Army of the A.E.F. He has been on the Medical Council of the Veterans Administration for many years.

#### Cumming Gets Social Hygiene Award

THE William Freeman Snow Award, a silver medal for "outstanding service in the field of social hygiene," was presented to Dr. Hugh S. Cumming, director of the Pan-American Sanitary Bureau and former Surgeon General of the United

States Public Health Service.

Maj. Gen. Merritte W. Ireland, former Surgeon General of the Army, bestowed the award at the

annual dinner meeting of the American Social Hygiene Association in the New York Academy of Medicine on February 2.

Dr. Cumming spoke on "Nations United for Health and Welfare in Peace and War." Dr. Ray Lyman Wilbur, president of the Association and chancellor of Leland Stanford University, discussed "The Future of Voluntary Agencies.

#### County News

Albany County

Dr. Walter J. Craig, director of the Division of Orthopaedics of the State Department of Health since July, 1927, has resigned to devote his time to private practice, Dr. Edward S. Godfrey, State Commissioner of Health, has announced. Before taking his state post Dr. Craig was assistant director of Johns Hopkins Hospital, Baltimore.\*

#### **Bronx County**

A regular meeting of the county society was held at Burnside Manor on February 16 at 8:30 P.M.

Two speakers took part in the scientific program. Iwo speakers took part in the scientific program. Dr. Israel S. Wechsler spoke on "Recent Advances in Neuropsychiatry." Col. William C. Porter, M.C., Director of Military Neuropsychiatry at Mason General Hospital, gave a talk entitled "Neuropsychiatric Lessons of World War II."

The county society Bulletin for February carries

the following announcement:

"There are vacancies on the Induction Board for orthopaedists, ophthalmologists, and neuropsychiatrists. Members interested in being placed on the available list are requested to communicate with the society's offices."

At the January meeting of the society resolutions on three subjects were adopted by the members. Those dealing with the Postwar Emergency Fund were published in the February 1 issue of this JOURNAL. The other two sets follow:

#### "WAGNER-MURRAY-DINGELL BILL

"WHEREAS: The Wagner-Murray-Dingell Bill (S. 1161), through its section on Medical Care and Hospitalization, offers to the peoples of the United States a system of medical practice government controlled, bureaucratic in nature,

Health Commissioner Ernest L. Stebbins of New York City has announced the appointment of Dr. Sophie Rabinoff as director of the Health Department activities in the Tremont Health Center and Bronx Borough office.

For the past five years district health officer at the East Harlem Health Center, Dr. Rabinoff is a graduate of the Women's Medical College of Pennsylvania. Her activities include membership in the New York County Medical Society, the American Medical Association, the American Public Health Association, the Women's City Club, and the International Society of Spanish-Speaking Women. Dr. Rabinoff also serves as editor of the Public Health Section of the Medical Women's Journal, and since 1938 she has been a member of the faculty of New York Medical College.\*

Capt. Chas. J. Gubitosi, (MC), USA, who was assigned to active duty in September, 1942, has been made Assistant Chief of the Surgical Service at Station Hospital, Camp Van Dorn, Mississippi.

#### Broome County

At the meeting of the county society in the auditorium of Binghamton City Hospital on February 8 Dr. Howard B. Slavin, assistant professor of medicine and bacteriology at the University of Rochester School of Medicine and Dentistry, gave a lecture entitled "Malaria."

This program was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York, in cooperation with the New York State Department of Health.

#### Erie County

Dr. Albert J. Colton, of Buffalo, has been practicing medicine in that city for fifty-three years. On April 17 he will celebrate his eightieth birthday.

On April 17 he will celebrate his cignature.

Dr. Colton is known throughout the United States and Canada for his Colton System, which he invented thirty-nine years ago. It is a card index system designed for physicians, to simplify book-

keeping and recording of case histories. It enables a doctor to keep, on one small card, a record of the illnesses of an entire family.

In 1905 Dr. Colton wrote an article on his index system for the American Medical Association's Journal. Upon its publication, he was swamped with mail from physicians of every state in the Union and Canada, asking where they could buy the system. He had no choice but to offer it for sale, and, today, supplying his Colton System users takes nearly as much time as his practice.—Buffalo Courier-Express.

#### Jefferson County

Dr. Gustav J. Loewenstein has left Watertown to engage in the practice of his profession in Brighton. suburb of Rochester.

His branch office at Dexter will be taken over by Dr. Samuel Marritt, practicing physician of Sackets Harbor. Dr. Marritt, health officer of Sackets Harbor and Dexter and the town of Hounsfield, will continue to practice in Sackets Harbor as well as Dexter.

Dr. Loewenstein has practiced in Watertown since January, 1941, coming to Watertown from New York. He was graduated from Albertus University, Koenigsberg, Germany, with his degree of doctor of medicine in 1922. He came to the United States from Germany in 1939.

Besides practicing in this city, Dr. Loewenstein

has had an office in Dexter since June, 1941.

Dr. Marritt has been practicing in Sackets Harbor for five years, coming there from New York.\*

#### Kings County

Doctors should organize a union or "professional guild" and enter politics in order to "safeguard the professional and economic integrity," urged Dr. Leo Schwartz, newly installed president of the Kings County Medical Society, in an address in the Academy of Medicine.

"Professional people have always held themselves aloof from organized labor; in fact looked down on such group organizations. It is my strong conviction that in order to insure the continuance of a high type of medical science it is essential to have a strong and forceful organization," he said.

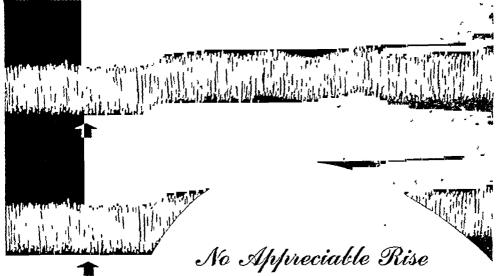

Dr. Schwartz denounced the proposed Wagner-Dingell social security bill which would provide more medical aid with government funds. He described it as a "political egg" and declared that "free medical advice and free clinics are foreign institutions. Americans do not desire assistance from charitable or government agencies, certainly not medical care."

Dr. Schwartz pointed to the doctor as being a scapegoat because he "fails to participate in the political life of the community." Because of this "lack of interest the politicians have little fear of or concern for doctors," he stated.—Brooklyn Citizen, January 19, 1944

Gifts totaling \$97,019 were received in the year which ended January 1, 1944, by the Long Island College of Medicine for eight research projects, staff expansion, scholarships, student loans, and a new department of psychiatry.

A six-year grant to the College from the Commonwealth Fund for the development of a new department of psychiatry was the outstanding contribution

#### [Continued from page 532]

received during the year, it was stated in the report prepared by Gilbert H. Thirkield, Treasurer of the This grant was made under the Commonwealth Fund's program to strengthen the psychiatric phase of education in the medical schools of the country.

Contributions of \$2,433 toward an overseas fund for the 79th General Hospital, the all-Brooklyn unit now stationed in the European war theater, were received from members of the medical staff and trustees of five hospitals affiliated with the medical school and from the staff and trustees of the college.

An additional grant of \$5,000 for scholarships was received from the W. K. Kellogg Foundation, Battle Creek, Michigan, which made an initial grant of \$10,000 the year before in a nationwide program to provide loans or scholarships for medical students prior to the adopting of the Federal program to put all able-bodied men in professional schools on an enlisted basis until their training is completed.

The receipt of \$43,432 in the first appeal for wide community support by the Long Island College of Medicine was another important contribution made

to the College during the past year.

More than 1,100 contributors to this fund included trustees, alumni, business firms, executives, members of hospital boards, physicians other than alumni, parents of students, fraternal orders, labor unions, and the public at large. The Annual Development Fund appeal will be carried on each year as a means of expanding the College's service to the community and its program of teaching and research.

For the education of its four hundred and twentytwo students during the past year and to maintain its important research projects and plant facilities, the College required a total budget of \$410,000. After July 1 tuition fees of students in uniform were paid by the government under the advanced specialized training program. Approximately one-half the budget was financed by income from endowment and current gifts.

Two endowed scholarships amounting to approximately \$20,000 were established in 1943, the Stanley P. Jadwin and Peter Yudkowsky Memorial

Scholarships.

A new prize award was established through the gift of \$1,000 in memory of Robert R. Benedict, the income from which is to be awarded each year to the fourth-year student who offers the best paper on the causes and treatment of any form of psy-The Presbyterian Hospital made a contribution of \$500 for research on the circulation of blood through the optic nerve, and the Commonwealth Fund continued its three-year grant to provide visiting professors under a plan to test the feasibility of more interchange of personnel between medical colleges. The Rockefeller Foundation made a grant of \$500 for a series of lectures on prob-lems in the distribution of medical care and the Blatt Memorial Fund was established to endow the quarterly cumulative index in the College's library. The American Medical Association gave \$250 for research work in the department of pathology.

Several commercial medical firms made grants

for special studies.

#### Monroe County

Dr. Walter Symington Maclay, medical superintendent of Mill Hill Emergency Hospital, London, addressed the county society and the Rochester Academy of Medicine on January 20.

Dr. Maclay's talk was illustrated by films showing the importance of the early recognition and care of neuroses in both the armed forces and the civilian population. Mill Hill Emergency Hospital is a neurosis center. He is associated also with West London, King George, and Maudsley hospitals.

Dr. Maclay is visiting several cities on his tour of

Canada and the United States.\*

#### New York County

The American Society of Anesthetists announces the following officers, chosen at its annual election December 9, 1943: Drs. Emery A. Rovenstine, president; McKinnie L. Phelps, secretary; and Virginia Apgar, treasurer. Dr. Albert J. Erdmann, Jr., spoke briefly at this meeting.

Dr. Condict W. Cutler, Jr., an alumni trustee of Columbia University, has resigned to accept a commission as a lieutenant colonel in the Army Medical Corps, it is announced by Dr. Nicholas Murray Butler, president of the University. He served in the last war as a first lieutenant in the medical corps from 1917 to 1919.

A special alumni convention will be held at Low Memorial Library at Columbia on Tuesday, March 7, to select a successor to Dr. Cutler, whose term would have expired in 1945. He has been a trustee

since 1939.

Dr. Cutler, who has been director of surgery at Goldwater Memorial Hospital, Welfare Island, New York, was graduated from Columbia College in 1910 and from Columbia School of Medicine in 1912. He served his internship at Roosevelt Hospital and in 1915 and 1916 was intern and resident gynecologist at Sloane Hospital. He returned to Roosevelt Hospital in 1917 as a member of the staff, serving on the medical board and as associate surgeon since 1932.

He was instructor in surgery at Columbia School of Medicine from 1919 to 1929. He was president of the College Alumni Association in 1937-1938 and was a member of the standing committee in 1934-1935. He was a former director-at-large of the Columbia Alumni Federation from 1929 to 1931.

Dr. Cutler is a member of the American Medical Association and the New York Surgical Society and is an officer in the Military Order of Foreign Wars.

Each of the more than 400 podiatrists of Manhattan have purchased one or more Fourth War Loan Bonds, according to an announcement by William E. Cotter, Director of the Commerce and Industry Division of the War Finance Committee. Dr. Arthur J. Weisblatt was chairman of the podiatrists in the campaign.

Onondaga County

Dr. Byron Stookey, neurosurgeon of New York City, spoke at the Syracuse University College of Medicine on January 27. His talk, "Head In-juries," was sponsored by Nu Sigma Nu, medical fraternity.

A graduate of Harvard Medical College, Dr. Stookey studied in Geneva, Vienna, and Berlin.

Dr. Orren D. Chapman and Dr. Bertram Levinson left Syracuse on January 21 to make a study of tropical diseases in Costa Rica and Guatemala,

For Dr. Chapman, professor of bacteriology and parisitology in the College of Medicine, Syracuse University, and director of the Bureau of Laboratories, Syracuse Department of Health, the trip will be a continuation of an interest aroused during the last war, when he served as a second lieutenant in the sanitary corps, U.S. Army, and was stationed in Panama for fifteen months.

Dr. Levinson will pursue his interest in pathology which led him to Vienna in 1930-1931, where he studied in the medical school of the University of Vienna for fifteen months. He also attended the

Army Medical School in Washington.

The Central American trip will be made under grants from the John and Mary Markle Foundation of New York, through the Association of American Medical Colleges, for the extension of teaching

tropical medicine.

Working in coordination with the Committee on Inter-American Affairs and with the approval and support of the Surgeons General of the U.S. Army and Navy, the Syracuse doctors will observe clinical cases and pathologic material at San Juan de Dios Hospital in San José, Costa Rica. They will visit the leprosarium, serpentarium, and public institu-tions there, and then go to Quirigua, Guatemala, to make clinical and laboratory observations of cases They will conclude their trip with a week's observation of public health activities in Guatemala City. They will return to Syracuse in March.\*

#### Richmond County

Dr. Max Bernstein, of Manhattan, will succeed Dr. Michael Antell as senior health officer in charge of the Richmond Health Center and the borough office of the Health Department, according to an announcement by Dr. Margaret W. Barhard, assistant health commissioner in charge of health administration.

Dr. Bernstein formerly was district health officer of the Lower West Side Health Center in Man-

He is a graduate of the College of Physicians and Surgeons of Columbia University and also did postgraduate work in the University of Vienna in

He is a member of the New York County Medical Society, the Academy of Medicine, and the American Public Health Association.\*

#### St. Lawrence County

Dr. J. G. Fred Hiss, clinical professor of medicine at Syracuse University, was the guest speaker at the meeting of the county society held in Potsdam on January 20.

Dr. Hiss discussed "Rheumatic Fever and Rheumatic Heart Disease." The meeting opened

with a luncheon at the Potsdam Club.\*

The life of a physician and some of the early Canton doctors were discussed by Dr. Frank F.

Williams of Canton at the weekly meeting of the Canton Lions Club at the Harrington Hotel on

January 24.
Dr. Williams went to Canton to start his practice in 1884 and is now the oldest physician in both actual age and point of service. In addition to his regular practice, he is town health officer and county jail physician. Summing up his long experience, he stated that he has met almost every conceivable human situation, and declared "there is no profession in which you meet so many sad and solemn events or so many humorous ones."

Dr. Williams, who has outlived fourteen other Canton physicians, came to Canton to take over the practice of Dr. L. T. Botsford, who practiced in several northern New York communities....

The speaker recalled that when he came to Canton in 1884 there were eight practicing physicians. They were Dr. Alvin Ames, Dr. J. C. Preston, Dr. Eugene Bragdon, Dr. Patrick Shea, Dr. Alfred Drury, Dr. John Bassett, and Dr. George Russell. Dr. Williams stated that physicians' fees were

very low at the turn of the century and many of the doctors were very poor. Dr. Shea charged as little as 25 cents for an office call and 50 cents for a house call. The speaker told of an occasion when Dr. Russell charged \$2 for a call in the country and paid \$2.50 livery rent for a horse to go with his own horse over the bad roads.—Syracuse Herald, Jan. 26

#### Warren County

Dr. William A. Rose, physician and surgeon, of Boston, has opened an office for general practice in Glens Falls. Dr. Rose went to Glens Falls from Haiti, where up until December, 1943, he was associated with a government rubber development project in the Department of Industrial and Tropical Medicines.\*

#### Westchester County

Biology and science teachers of Westchester County high schools are participating in a pioneer venture of the county's Cancer Committee to bring cancer education into the high school curriculum.

In a series of lectures under the auspices of the Committee, Dr. C. R. Halter, assistant biologist at Memorial Hospital, New York City, is presenting to these teachers the modern knowledge concerning cancer. They, in turn, are expected to evaluate this material critically from the point of view of suitability for incorporation into science courses.

The lectures are being held once a month at the Hotel Commodore, New York City, four having already been given—November 6, December 11, January 8, and February 5. The next two will be delivered March 4 and April 1. It is planned to continue the series even a period of three years. continue the series over a period of three years.

Dr. Halter's first lecture was devoted to an outline of the natural history of cancer, immediate and accessory causes, early recognition, and the cura-

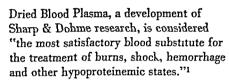

bility of early cancer.

In his second lecture, he compared the characteristics of malignant and benign tumors and the causes of cancer. With respect to predisposing internal factors, he said that little is known about normal cells, the manner of their growth and division, growth-stimulating and restraining factors, and the influence of aging. Presenting the more control heard of the control of their growth and division, growth and growth an crete knowledge concerning various external causes,

#### A UNION FOR DOCTORS

No other remark is quite so infuriating to the unionist of a Red tint as a reference to the medieval

The mere mention of those organizations—which operated to the mutual benefit and satisfaction of master, worker, and apprentice—is anathema to the present-day radical, the first tenet of whose creed is incompatibility between classes and groups.

It is therefore interesting to note that Dr. Leo S. Schwartz, newly elected president of the Kings County Medical Society and the Academy of Medicine of Brooklyn, chose the unpopular word "guild" as the suggested designation for a professional combination for protection against politicians and "social coddlers."

To be sure, Dr. Schwartz went even further and urged his fellow doctors not to overlook the possibility of the "much-hated union" for a defense of their economic and professional rights. The important point, however, is that his first choice of a name was "guild," obviously as more befitting the

dignity and character of medical practice.

It is the "social coddlers," with their intolerant liberalism, who would object most strongly to any return to the virtues and traditions of the Middle

Ages, solely on the grounds that any vestige of the past is worthless per se. They are the blind admirers of progress for its own sake, with intellects incapable of grasping G. K. Chesterton's comment, "It is just as bad to feel superior to a man in the thirteenth century as to one in the Old Kent road."

Nevertheless, these "social coddlers" are determined to create a modern man out of all semblance to humanity in the thirteenth, twentieth or any other century. As Dr. Schwartz said, they have devised the "catch-phrase" of "adequate medical care" to persuade the unwary that the hope of public health lies in the political regimentation of physicians and surgeons.

The medical profession would be shortsighted indeed if it were to accept this fate without protest or opposition. It would do well to heed Dr. Schwartz "strong conviction that in order to insure the continuance of a high type of medical science and practices against political manipulations, it is essential to have a strong and forceful organization." Political panaceas and radical verbiage are poor substitutes for the healing art in a critical illness or major operation.—Editorial in the Brooklyn Citizen, January 20, 1944

IT is well recognized that acute symptoms of the common cold usually expend themselves within two or three days. Then pneumococci, hemolytic streptococci, staphylococci or other micro-organisms invade the respiratory passages and prolong and aggravate the illness.

This is the time when the cold is most vulnerable to chemotherapeutic attack because these organisms are sensitive to Sulfathiazole. This is the time Sulmefrin\* is useful. Sulmefrin contains desoxyephedronium sulfathiazole which combines the antibacterial properties of sulfathiazole with the proved vasoconstrictive action of ephedrine compounds.

Clinical studies<sup>1,2</sup> have shown that Sulmefrin facilitates drainage and ventilation, producing prompt and prolonged vasoconstriction without such side-effects as sneezing, tachycardia or nervousness. It may be used as a spray, as drops or by tamponage.

Supplied in 1-ounce dropper bottles and in 1-pint bottles.

Literature on sequest.

### Associated Hospital Service Honors Dr. Paul Keller

R. PAUL KELLER, vice-president and medical York, died on December 22, 1943, of a heart at-

tack, at the age of fifty-two years.

Dr. Keller was one of the pioneers in the esta-blishment of Blue Cross Hospital Service Plans in the United States. In April, 1939, he was appointed medical director of the New York Plan and during his period of service there was a progressive increase in the scope of hospital care in Greater Through his efforts, the Plan and its two hundred and sixty-four member hospitals were brought closer together in their mutual objective of serving the public.

Mr. Louis H. Pink, president of Associated Hospital Service, upon hearing of the death of Dr. Keller, stated: "The nonprofit hospital service plans of America have lost one of their most progressive leaders. Dr. Keller was a man of ideas. He constantly strove to place better hospital care within the reach of all in the community. His efforts toward the improvement of hospital and medical service in New York, and throughout the nation, will serve as a lasting memorial to his de-

voted service."

Dr. Keller was instrumental in organizing the Hospital Service Plan of New Jersey. He was a recognized authority in the field of hospital administration and was a frequent contributor to hospital and medical journals. Among his publications were: "A Forward Step in Medical Care" and "Social Responsibilities of the Physician and Hospital."

Dr. Keller was born in Philadelphia on November 2, 1891. He prepared himself for the Presbyterian

ministry, but his interest later turned to medicine. He graduated from Jefferson Medical College in June, 1917. During the first World War he served in the Navy as Senior Medical Officer and was honorably cited for his service; after the war he served in the Navy in the Danish West Indies and in Mexico, where he studied tropical medicine. He came to Newark in February, 1921, as Executive Director of Newark Beth Israel Hospital, and was active in the campaign which resulted in the opening in 1928 of its new \$4,000,000 hospital building. He left Beth Israel in 1934 to head a group specializing in industrial medicine and to carry on private practice.

Dr. Keller was the New Jersey representative among twenty-five American doctors selected by the New York Academy of Medicine in 1930 to study health resorts in France as guests of the French Government. He advocated sharing by municipalities and county governments of the care of the indigent in private hospitals to ease the burden on

paying patients.
Dr. Keller served on the Emergency Relief Administration of New Jersey Administrative Council in 1934 and that year was named medical director of the Bankers Indemnity Company of New Jersey. In 1935 he was named to the unsalaried post of director of the Newark Bureau of Industrial Hy-When the Association of Industrial Physicians and Surgeons of New Jersey was organized in 1938 he was chosen acting secretary. He had served as staff surgeon for the Pennsylvania Railroad and member of the Executive Committee of the University of Newark and was former president of the State Hospital Association.

#### The Care of Communicable Diseases in General Hospitals

T a recent conference of hospital administrators and local health officers in an upstate county at which the question of the hospitalization of acute communicable diseases in general hospitals was discussed, it was recommended that the atti-tude of the State Department of Health in this matter be presented in *Health News* for the benefit of health officers, attending physicians, and others.

In the early part of this century there was a tendency on the part of municipalities to build special hospitals for the isolation of communicable diseases. These so-called "pest houses" were designed particularly for the care of smallpox cases but were intended for the isolation of other acute infectious diseases as well. At that time, it was thought feasible to control communicable diseases in communities through isolation of recognized cases, since it was felt that if all patients were isolated until they were no longer infectious, the spread of these diseases would cease. However, upon further investigation from a bacteriologic standpoint, it was learned that in many communicable diseases, symptomless carriers and atypical cases which ordinarily would not be recognized as infectious are frequently more important in the spread of the disease in the community than the typical cases which can be detected. The routine hospitalization of acute communicable diseases for the sole purpose of limiting spread of the infection in the community,

therefore, obviously would not accomplish this

At present, hospitalization of contagious diseases ordinarily is recommended only in those cases requiring care from the standpoint of the welfare of the patient himself and which can be given only in a hospital and not at home. In rare circumstances, it may still be necessary to hospitalize patients from the standpoint of the protection of the community as, for example, in the case of a communicable disease discovered in a transient or occurring in a home in which for certain reasons proper isolation

is impossible. Concomitant with the development of our bacteriologic knowledge of communicable diseases, technics have been devised to permit the safe isolatechnics. tion of cases of communicable diseases in general hospitals. These procedures vary with the disease; some patients can be cared for without danger on a ward; others must be confined to a private room. However, there is essentially no communicable disease which cannot be cared for safely in a private room on a floor on which there are other patients with noncommunicable diseases, providing certain technics are practiced rigidly by the attendants. It has become increasingly clear that the training and skill of the attendants are much more important

in controlling the spread of infection than the physi-

cal equipment provided.

In the opinion of the New York State Department of Health, therefore, separate buildings for the sole care of communicable diseases are not essential. larger municipalities it may be more convenient for a hospital to have a separate building for this purpose, but this is a matter of convenience and not In smaller places in which such a building would be vacant a large part of the time, an unnecessary expense to the community would be entailed.

Every hospital is dealing with communicable diseases whether or not it recognizes that fact. Because of the prevalence of carriers and atypical

cases among the general population, it is inevitable that such carriers and cases will be admitted from time to time to a hospital even though the infection is not detected at the time of admission. The routine procedures followed in these hospitals, therefore, with regard to the hygienic practices of the attendants, the handling of food and dishes, and the use of various types of equipment (such as thermometers, enema apparatus, etc.) should be such that there is no likelihood of the transfer of secretions or excretions from one patient to another. If such technics are not followed, sooner or later an outbreak is bound to occur through the introduction of pathogenic micro-organisms by a carrier or atypical case.—James E. Perkins, M.D., in Health News

#### Hospital Fund Drive Exceeds Goal

SEVEN new trustees were elected to the board of the United Hospital Fund of New York on February 1 at the sixty-fifth annual meeting at headquarters, 370 Lexington Avenue. Present officers and trustees were re-elected and progress reports were made by the president, Roy E. Larsen, the treasurer, Edwin P. Maynard, and the vicepresident and chairman of women's committees. Mrs. Frank E. Adair. Edgar H. Boles, president of the General Reinsurance Corporation, and recently elected president of New York Post-Graduate Medical School and Hospital; Henry C. Brunie, president of the Empire Trust Company; Everett M. Clark, assistant secretary, Brooklyn Trust Company, president of the Brooklyn Club, and Brooklyn chairman of the United Hospital Campaign for the last three years; Charles P. Cooper, vice-president of the American Telephone and Telegraph Company and president of the Presby-terian Hospital; Edward J. Noble, president of the board of trustees, St. Lawrence University, president of the Blue Network, and chairman of the Life Savers Corporation; Edwin A. Salmon, chair-

man of the City Planning Commission, chairman of the Hospital Council of Greater New York, and a trustee of Memorial Hospital; and Mrs. Curry Watson, vice-chairman of Women's Committees and chairman of Medical Social Service, United Hospital Fund, are the new trustees,

Mr. Larsen reported that the sixty-fifth annual appeal, just closed, was most successful. "We not only attained our objective, \$1,457,120.01," said Mr. Larsen, "but we are \$85,577.57 beyond our

goal, with \$1,542,697.58 raised to date.

Mr. Larsen paid tribute to the campaign leaders and workers who collected this money and expressed appreciation to the thousands who contributed to the needs of the hospitals. "The response to our appeal was most gratifying," he said, "but more important, I think, was the indication of a growing appreciation of our seventy-five voluntary member hospitals and a desire to guarantee continuance of their community services."

Mr. Larsen announced that William H. Zinnser,

1943 campaign chairman, has agreed to head the

1944 appeal next fall.

#### Kellogg Foundation Votes Grant for Postwar Study

THE Board of Trustees of the Kellogg Foundation has voted a grant of \$35,000 for study by the Postwar Planning Committee of the American Hospital Association of the postwar hospitalization needs of America. The worth of this project had already been recognized by a grant of the same amount from the Commonwealth Fund, contingent upon securing the rest of the \$100,000 two-year budget from other sources. The Board of Trustees budget from other sources.
of the American Hospital Association has voted \$15,000 this period.

The research of this two-year program will seek to determine the adequacy of distribution of present hospital facilities and the best method of insuring adequate hospital care for all citizens. Recom-mendations for postwar hospital needs must be

considered in the light of racial and climatic differences, relative standards of living, and other varying factors which need analysis.

At the earliest possible date the study commission will be formed and the program will be initiated. The present heavy utilization of hospitals has led many of the boards of trustees of hospitals to plan an extension of hospital services in the immediate postwar period, and legislation directed to establish the method of payment for hospital service on a compulsory basis has been introduced in Congress. This general interest in the functions and facilities of hospitals indicates the necessity of a comprehensive study which will make available expert consultation and statistics related to the individual hospital, the community, and the nation.

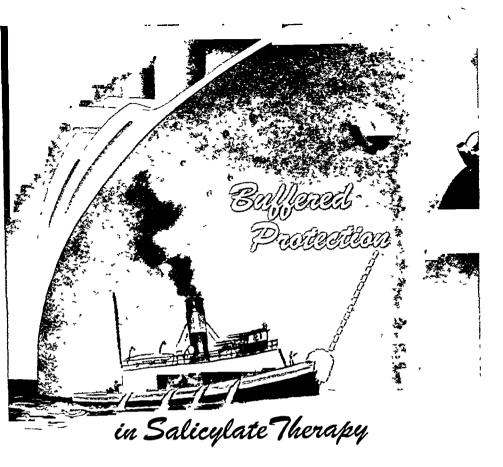

#### New Nurse Recruitment Officer Joins American Hospital Association

ON FEBRUARY 1 Miss Mildred Riese, super-intendent of Orthopaedic Hospital, Los An-geles, joined the staff of the American Hospital Association as Nurse Recruitment Officer, to coordinate the Association's activities under a contract with the United States Public Health Service for the program of the United States Cadet Nurse Corps. The National Nursing Council for War Service has the major responsibility for the re-

cruiting program, but the Nurse Recruitment Officer of the American Hospital Association will work with those portions of the program affecting hospitals and the hospital administrators.

The American Hospital Association is particularly concerned with the position of the hospitals as information centers for applicants interested in entering a school of nursing, and will continue its

efforts to encourage hospitals to increase their

training capacity.

Utilization to the fullest possible extent of the hospitals' established and increasing facilities for nurse training and the promotion of the program through Association members and the public will be carried forward under the general approval and direction of the United States Public Health Service and in cooperation with the National Nursing Council for War Service.

Prior to becoming superintendent of Orthopaedic Hospital in 1924, Miss Riese was superintendent of the North Carolina Hospital at Gastonia. A

graduate of the Waltham, Massachusetts, Training School for Nurses, she holds a B.S. degree from Teachers College, Columbia University, with a major in hospital administration.

Miss Riese is a fellow of the American College of Hospital Administrators, a member of the Association of Western Hospitals, a former trustee and chairman of the Council on Professional Practice of the Association of California Hospitals, and has held various offices with the Hospital Council of Southern California.

She has been a member of the American Nurses' Association since 1919, and a member of the American Hospital Association since 1931.

### Improvements

A Federal Works Agency project for expansion of nurse training facilities at Syracuse University at an estimated cost of \$161,400 has been approved by President Roosevelt, according to a telegram received by former Senator Francis L. McElroy from Senator James M. Mead in Washington.

The project, to be financed through Lanham Act funds, provides for the acquisition, conversion, equipping, and furnishing of a four-story and basement apartment building for a nurses' school and

dormitory.

The Syracuse University School of Nursing, which opened June 28, using the combined facilities of University and Memorial hospitals, has been approved for participation in the nurses' training program under the Bolton Act.

The present total enrollment of the school is 270

students.\*

A storage building consisting of basement and one floor will be constructed at St. Peter's Hospital in Albany, at a cost of \$7,000, according to a permit issued by Albany Building Department.

The 33 by 80 feet brick structure will be adjacent to the corridor connecting the hospital and the nurses home. The permit was issued on govern-

ment priority sanction.\*

The following is a quotation from the Batavia News of December 15, 1943:

"Plans had been made for a formal opening when the new maternity annex at the Batavia Hospital was furnished, but the stork, a very busy bird these days, upset the plans by bringing more babies than the already overtaxed mater-nity ward could accommodate, and so, without ceremony, three happy mothers became the first members of the "club"

"The annex has been completely remodeled and renovated and each room painted a soft pastel shade, with harmonising curtains and furnishings. It is connected with the maternity ward by a short enclosed runway, a continuation of the pres-ent Maternity Hall, in full view of the nurses' central call station.

station.

"The building was opened in January, 1908, the gift of Mrs. Adelaide Richmond Thomas in memory of her father, W. Eugene Richmond...."\*

The Mount Vernon Hospital has just completed installation of new x-ray treatment equipment in its x-ray department, it was announced by Arthur B.

Solon, superintendent.

The equipment is the latest in model and design and will be used in the treatment of cancer, nonmalignant tumors, blood and glandular diseases, a large variety of infections, and a wide range of skin conditions. This equipment makes possible the use of x-ray in treating these diseases, by utilizing a high voltage which produces a constant flow of x-rays which are directed into the body area under treatment.

Installed at a cost of \$7,500, the new equipment replaces x-ray treatment equipment installed in 1931. Necessary priority for its purchase and installation was allowed by the War Production Board because the Mount Vernon Hospital is the control institution in the companion that the production of the companion of the compan only institution in the community providing this type of service to those who need it. The new equipment will be a memorial to the late Dr. Archibald V. Campbell, and funds left to the hospital by Dr. Campbell's wife for this purpose were used for its purchase.\*

A public address system and combination record player and recorder have been presented to Rhoads General Hospital in Utica by employees of the Oneida Knitting Mills.\*

#### At the Helm

The names of seven Brooklyn and Long Island residents have been sent to the Senate by Governor Dewey for confirmation of their appointments as members of the boards of visitors of state institutions. Nearly all have been serving under interim appointments which the Governor made last year while the Legislature was not in session.

Included in the list are Albert Hutton of Brooklyn for member of the Board of Visitors of the Pilgrim State Hospital, Jacob Goetz of Brooklyn for member of the Board of Visitors of the Brookyn State Hospital, The Rev. Hugh M. Graham of Brentwood, Mrs. Merry Parkes of Port Washington, and William H. Clayton of Kings Park for the Board of Visitors of the Kings Park State Hospital, and Mrs. Dwight Hoover of Hempstead for the Board of Visitors of the Rockland State Hospital.

The only noninterim appointment was that of Mrs. Webster F. Williams of Hollis, for the Board of Visitors of the Creedmoor State Hospital. She succeeds Mrs. Edna V. Newbranch, whose term had

expired.

The Governor also submitted the name of Robert Higbie, Jr. of Jamaica, for member of the Interstate Sanitation Commission.\*

High tribute for the work of the Volunteer Nurses' Aides and the Girl Scouts during the past year was expressed in reports presented at the annual meeting of the Geneva General Hospital Corporation, which was held preceding a meeting of the Board of Trustees on January 12.

D. C. Hutchins was elected president of the board of trustees at the meeting of the board.

Other officers elected were: vice-president, Foster P. Boswell; secretary, Mrs. Ronald M. Harman; assistant secretary, Lansing S. Hoskins: treasurer, Vernon Alexander; assistant treasurer, William P. O'Malley.

Dr. Gustav Selbach, director of the Ontario County Laboratory, reported that 12,889 examinations of various kinds had been made for the Geneva General Hospital during the year 1943, and that several new pieces of equipment have been pur-chased for the laboratory at the local hospital.

Also announced by Dr. Selbach was the appointment of Eugene A. Norod as medical technologist

at the Geneva General Hospital.

William M. Fink, retiring president, expressed appreciation to all of the board members, and a vote of thanks was extended to Mr. Fink by the board members,\*

A. Palmer Brooks has been elected to the board of managers of Mount Vernon Hospital to fill the unexpired term of Richard M. Winfield, who resigned last November after serving on the board for thirty-six years. Vice-president of the board when he resigned, Mr. Winfield is now an honorary member.\*

D. Frank L. DeFurio, Auburn physician and former coroner, was elected president of the medical staff of Mercy Hospital at their annual meeting. He succeeds Dr. Bernard L. Cullen. Dr. L. D. Burlington, of Aurora, was elected vice-president, and Dr. Anthony L. Spadaro was re-elected secretary and treasurer.\*

Dr. Joseph Cornell, gynecologist at Ellis Hospital, Schenectady, has been elected to the medical board of that institution. He succeeds Dr. William Mallia.\*

Two appointments were made at a recent meeting of the directors of the Tarrytown, Hospital. Dr. P. F. McElroy, of New Canaan, Connecticut, was designated as pathologist and has taken over the laboratory work which the late Dr. H. O. von Wedel performed for many years.

Dr. McElroy formerly was associated with the

hospital, as well as with Dr. von Wedel.

The other new appointment is that of Dr. Frederick M. Breitbarth, physician at the Manumit

School, Pawling, as house doctor.\*

Dr. John E. Groff, of Rome, has been appointed a member of the board of managers of the Rome and Memorial Hospital by Mayor Walter W. Abbott. He succeeds Mrs. Arthur T. Whyte, whose term

has expired. The appointment is for five years. Dr. Groff is a native of Rome and has been a practicing physician there for thirty-six years.

He was president of the board when the Rome Hospital and Murphy Memorial Hospital were merged into one organization. He was formerly a member of the board of managers.\*

Dr. S. Eugene Barrera is the new psychiatrist-inchief and neurologist at Albany Hospital and professor of neurology and psychiatry at Albany Medical College.

Dr. Barrera went to Albany Hospital from the New York Psychiatric Institute, where he was principal research psychiatrist. He is a graduate of Columbia College, Columbia University, and the College of Physicians and Surgeons.

Dr. Barrera succeeds Dr. D. Ewen Cameron.\*

Dr. Donal Sheehan, acting dean of the New York University College of Medicine, has announced the appointment of Dr. Howard C. Taylor as chairman of the department of obstetrics and gynecology. Dr. Taylor has been a member of the faculty of the New York University College of Medicine since 1935. He is associate visiting obstetrician and gynecologist at Bellevue Hospital, attending surgeon at Memorial Hospital, and attending gynecologist at Roosevelt Hospital.

E. Elwin Glover, assistant to Dr. Fraser D. Mooney, superintendent of the Buffalo General Hospital, has been named superintendent of Brooks Memorial Hospital in Dunkirk.

Mr. Glover has been on the staff of the Buffalo institution since 1927 and was trained for hospital

administration at the University of Chicago.

He succeeds Dr. Ina B. Hall, whose resignation became effective on December 1. Dr. Hall, whose home is in Richmond, Virginia, came to the hospital as superintendent in May, 1943.\*

Dr. David C. Thurber, of Sherrill, has been appointed resident physician at Elliot Hospital, Manchester, New Hampshire.

He recently completed his internship in Roch-

ester General Hospital.

Dr. Thurber is a graduate of the Medical School of the University of Rochester, where he was commissioned a second lieutenant in the Army Medical Corps. He recently was given his honorable discharge from active service.\*

Southside Hospital in Bay Shore has announced the appointment of H. F. Rudiger, Jr., as director

of the hospital.

Mr. Rudiger was assistant superintendent of Newark Beth Israel Hospital for six and a half years. He then joined the Long Island College Hospital of Brooklyn, serving in a similar capacity for two and and a half years, terminating his connection there to assume his new duties as director of Southside Hospital.\*

Ferdinand Eberstadt is the chairman of the 1944 maintenance fund campaign which began in Janu-[Continued on page 548]

Each effervescent tablet dissolved in water provides the sodium salt of aspirin 8.5 grs. and sodium citrate 27 grs.

# COMBINED BUFFERS ENHANCE EFFECTIVENESS AND TOLERANCE

More Rapidly Effective—The emptying time of the stomach is speeded, hence absorption of the analgesic is hastened, by the buffer alkali mechanisms in association with the CO<sub>2</sub> factor of the effervescent base.

A Shield of Protection—Buffer alkali mechanisms protect the analgesic, sodium acetylsalicylate, from hydrolysis in the stomach. Tendency to gastric upset is reduced.

Acetyl-Vess is supplied in bottles of 25 tablets through your prescription pharmacy or medical supply house.

ary to raise \$160,000 for Beekman Hospital in New York City, which furnishes hospital facilities to an area covering nearly 300 city blocks in lower New York, south of Canal Street.

The hospital's directorate is composed of a group of business men who have for years been actively concerned with furnishing health protection to that part of the city. Howard S. Cullman is president.

Beekman has served the downtown community

almost forty years, \*

Harrison B. Wright has been re-elected president of the South Nassau Communities Hospital. W. Sargeant Nixon was returned as vice-president from Freeport, with Jacob Lampert as treasurer and James G. Joslin as secretary. Mr. Nixon and Charles J. Martin were re-elected to the board of directors.\*

Mrs. Helen Ross, superintendent of the Tompkins County Memorial Hospital in Ithaca, has been reappointed to serve in that office for another two

Five new trustees were elected at the annual meeting. They were Mrs. Anna G. Whitcomb, Mrs. Marion Hulse, V. A. Fogg, Harry Gordon, and Harold Wilcox. Retiring trustees were Walker N. Brand, Miss Katherine Harris, and James P. McNamara.\*

Prof. Thomas M. Hills of Vassar College, was re-elected president of the board of trustees of Vassar Brothers Hospital at the annual meeting of

All other officers also were re-elected, as follows: Halsey P. Wyckoff, vice-president, Baltus B. Van Kleeck, treasurer; William B. Sheldon, assistant treasurer; Mrs. Alexander G. Cummins, secretary; and Mrs. Eleanor Terpenning, assistant secretary.

Seven trustees, nominated by the Vassar Brothers Hospital Association, were named to the board, five being re-elected and the other two being newly

Re-elected were Erik Aldeborgh, Mrs. Cummins, Professor Hills, Mr. Van Kleeck, and Mr. Wyckoff. Newly elected trustees are Mrs. Harry H. Hill, of Rhinebeck, and J. Ernest Doolittle.\*

Dr. S. M. Rabson, who received a medical discharge from the Navy last spring after two years on active duty, has resigned as assistant professor of pathology at New York Post-Graduate Medical School, Columbia University, to accept the post of laboratory director at the new Franklin D. Roosevelt Hospital, Bremerton, Wash.

Dr. Charles W. Woodall was elected chairman of the medical and surgical staff of Ellis Hospital in Schenectady at the annual meeting of the hospital staff. He succeeds Dr. G. Marcellus Clowe.

Dr. Arthur H. Congdon was named vice-chairman of the staff and Dr. Charles Rourke was reelected secretary.\*

Edgar H. Boles has been elected president of the New York Post-Graduate Medical School and Hospital, succeeding Dr. Arthur F. Chace.

Dr. Chace, president of the New York Academy of Medicine, served as president of the medical school and hospital for for teen years.

A member of the board since 1922, Mr. Boles, as chairman of the committee on new buildings, has played a large part in developing a postwar building program soon to be announced. Charles S. Mc-Veigh, a member of the firm of Morris & McVeigh, who has been a member of the board since 1932, was elected a vice-president.

The plan to enlarge the medical school and hospital and to expand its facilities, Mr. Boles explained, is designed to meet an "unprecedented demand" for postgraduate training expected after

the war.

Beth Israel Hospital in New York City has appointed Drs. Louis Wender, Joseph Epstein, Morris D. Epstein, David Beres, David Schryver, Samuel J. Obers, R. J. Almansi, G. Trefousse, and I. Malbin to the staff of its Evening Mental Health Clinic.

Dr. George Baehr took part in the first regional institute for hospital administrators, which was held in Mexico City, January 16-29, under the auspices of the Pan-American Sanitation Bureau and the Inter-American Association of Hospitals.

Dr. Leverett D. Bristol, executive director of the Hospital Council of Greater New York, has been appointed chairman of the Health Advisory Council of the Chamber of Commerce of the United States.

The personnel of the medical staff of the Nathan Littauer Hospital in Gloversville, headed by Dr. M. F. Donnelly, has been announced for 1944. The names of fourteen members of the staff who are serving with the armed forces are included in the list.

Dr. A. F. Goodwin, who entered service early, and Dr. John Shannon, have returned, after receiving honorable medical discharges.

Two new members, assigned to the courtesy staff, are Dr. Emanuel Eckstein and Dr. Fritz Popper. Dr. Popper is located at Fultonville.

Popper. Dr. Popper is located at Fultonville.

The active members of the staff at the present time are: attending surgeons—Dr. George Lenz, Dr. B. G. McKillip, Dr. E. G. Gillmore, Dr. Claude Bledsoe, Dr. L. H. Backus, Dr. M. F. Donnelly, Dr. F. G. Calder, Dr. H. B. Riggs, Dr. S. J. Colton, Dr. F. S. Hyland, and Dr. B. A. Winne; assistant attending surgeons—Dr. A. J. D'Errico, Dr. Robert Lenz, Dr. Louis Tremante, Dr. W. F. Hesek, Dr. Samuel Russell; attendants in medicine—Dr. R. L. Ellithorpe, Dr. H. H. Oaksford, Dr. A. H. Sarno, Dr. Woodard Shaw, Dr. S. C. Clemans, Dr. R. S. Kunkel, Dr. Morris Kennedy, Dr. E. N. Perkins; assistant attendants in medicine—Dr. A. F. Goodwin, hematologist; Dr. W. R. Grunewald, Dr. Dominic Battaglia, Dr. Malcolm McMartin, Dr. K. Durand, Dr. H. W. Beaty, Dr. J. J. Thompson, Dr. B. The re-election of Charles S. Andrews as president of Tuckahoc's Lawrence Hospital has been announced.

Other officers re-elected for 1944 were: Thomas B. Gilchrist, vice-president, J. Robertson MacColl, Jr., secretary, and Frankland F. Stafford, treasurer.

James A. Lyles was elected as a new member of the board, succeeding the late Edgar V. O'Daniel, who was a member from the year 1932 until the time of his death.

Other members of the board of governors for 1944 are: Chas. S. Andrews, Robert L. Barrows Mrs. Pressley Bisland, William Callen, Mrs. Harold Flammer, Clarence Francis, Thomas B. Gilchirst, Alexander Hadden, Dudley B. Lawrence, J. Robert-son MacColl, Jr., Lewis V. Mays, Joseph V. Mit-

**Newsy Notes** 

The Mount Sinai Hospital honored 90-year-old Dr. Alfred Meyer, oldest living graduate of its House Staff and one of the foremost leaders in the conquest of tuberculosis, at a ceremony in Blumen-

thal Auditorium on January 27.

Dr. Meyer, whose association with Mount Sinai dates back to 1877, was presented with a testimonial volume as a tribute to his distinguished career in medicine and civic leadership. The presentation volume, a special issue of the Journal of the Mount Sinai Hospital, contains some thirty-five articles, most of them scientific reports, contributed by Dr. Meyer's professional associates.

Speakers at the ceremony were Leo Arnstein, Commissioner of Welfare of New York City and president of Mount Sinai Hospital, Dr. James Alexander Miller, former president of the New York Academy of Medicine, and Dr. Ira Cohen, president

of the Hospital's medical board.

As long ago as 1901 Mayor Seth Low of New York, in laying the cornerstone of the Mount Sinai buildings on their present site, declared that if the hospital had been responsible for nothing else but the development of Dr. Alfred Meyer it

would have justified its existence.

Dr. Meyer is not only the eldest alumnus of Mount Sinai, but the second oldest living graduate of Columbia University. He was graduated from Columbia in 1874, and from its College of Physicians and Surgeons in 1877. He did postgraduate work at the universities of Vienna and Leipzig.

chell, Howard C. Sheperd, and Frankland F. Staf-

Alexander C. Nagle, of Scarsdale was re-elected president of the White Plains Hospital Association

at the annual meeting in January.

Also re-elected were George F. Thomas, treasurer, and Otto C. Jaeger, secretary. Edward M. West, A. J. Purdy, and Paul Fox, of Scarsdale, were elected vice-presidents.

Newton I. Steers, of Ridgeway, was elected to the board of governors. Mr. Nagle, Mr. Jaeger, and Robert P. Smith were re-elected to the board.

Donald C. Hutchins was elected president of the Geneva General Hospital board to succeed William Fink, and other officers of the board were re-elected.\*

The entire slate of officers of the Saranac Lake General Hospital was re-elected at the annual meeting of the Board of Directors.

Those renamed are: T. Edward Williams, president; Miss Celeste Thieriot, vice-president; Arthur Alliason, treasurer; Charles S. Barnet, secretary, and Mrs. Joseph L. Nichols, honorary vicepresident.

Directors named for the new year are: Mrs. Irving Altman, Dr. E. R. Baldwin, Mrs. Lawrason Brown, Miss Julia Conklin, Fred Conrad, E. L. Gray, Mrs. F. Ferris Hewitt, Dr. Hugh Kingshorn, Clifford McCormick, D. S. McCrum, C. M. Palmer, Miss Mary Prescott, Aaron Shapiro, Miss Madeline Smith, Mrs. Robert Wainwright, and Thomas P. Ward\* Ward.

Dr. Meyer was appointed to the Mount Sinai House Staff immediately after his graduation from medical school. He subsequently served as a member of the Hospital's attending staff until 1919 when he retired from active service and was elevated to his present rank of consulting physician to the

Hospital. Among Dr. Meyer's many-sided activities, that which has brought him the widest world renown has been his championship for more than half a century of the struggle against tuberculosis. He was one of the founders of the National Tuberculosis Association and served as one of its principal officers in various capacities for many years. He was active in organizing the International Congress on Tuberculosis in Washington in 1908. Following that meeting Dr. Meyer, single-handed, collected funds to bring to New York the exhibit which was compiled for the Congress. Placed on view here at the Museum of Natural History, it was seen by 750,000 people and played a significant part in proposing the public to the importance of control of arousing the public to the importance of control of the "white plague."

In 1919 Dr. Meyer was one of the incorporators and first directors of the New York Tuberculosis Association. Last year this association awarded

him a testimonial for his many years of service.

Dr. Meyer's crusade against tuberculosis started before the turn of the century. In 1899 he was appointed visiting physician to the sanatorium which

[Continued on page 552]

The potentiation of the central action of phenobarbital by the belladonna alkaloids (Friedberg, Arch. f. exp. P. & P. CLX, 276) renders possible attainment of desired effects with relatively small doses, thus avoiding 'hang over' and other unpleasant side actions. In contrast to galenical preparations of belladonna, such as the tincture, Belbarb has always the same proportion of the alkaloids.

indications: Neuroses, migraine, functional digestive and circulatory disturbances, vomiting of pregnancy, menopausal disturbances, hypertension, etc. Formula: Each tablet contains ¼ grain phenobarbital and the three chief alkaloids, equivalent approximately to 9 minums of tincture of belladonna.

Beibarb No. 2 has the same alkaloidal content but 1/2 grain phenobarbital per tablet.

### IODINE

A Preferred Antiseptic in Surgery

Iodine in alcoholic solution has pre-operative qualities highly desirable in surgery.

Not only is it an effective means of asepticizing the skin prior to incision, but by stimulating rapid cell proliferation and producing a light form of hyperemia, it influences rapid healing with, usually, a clean, small scar.

had been opened by the Montefiore Hospital at Bedford Hills, New York. When Dr. Meyer first started his work there, the institution was housed in a small remodeled farm house. At Bedford

Hills Dr. Meyer introduced the method of treatment by artificial pneumothorax—collapsing of the infected lung to permit it to rest and heal—a few years after its discovery in Italy by Dr. Carlo Forlanini. Here, too, Dr. Meyer developed occupational therapy for tuberculous patients, giving them individual garden plots to cultivate.

pational therapy for tuberculous patients, giving them individual garden plots to cultivate. Several of the principal public tuberculosis sanatoria in New York State owe their establishment in considerable measure to Dr. Meyer's efforts. The first of these was the Ray Brook Sanatorium, which was opened in 1904 and which placed New York State second only to Massachu-

culous poor.

Dr. Meyer was largely responsible for the founding by New York City of its municipal tuberculosis sanatorium at Otisville. He was also active in the establishment of the Sea View Hospital and was chairman of the research advisory board of the National Jewish Hospital for Consumptives in

setts in establishing a state hospital for the tuber-

The Village Board of Ilion has directed Fred. J. O'Donnell, village attorney, to prepare the necessary papers to submit to the State Legislature which will permit the board to increase its annual contribution to Ilion Hospital to \$10,000 yearly.

Denver.

At present the sum of \$5,000 is given the hospital annually, which provides for the operation of two free beds, including nursing and hospital service.

Duncan Wemyss, president of the hospital board,

Duncan Wemyss, president of the hospital uses states that since the new wing has been put into use and the repairs and renovations are about completed, space in the hospital is approximately doubled.\*

Bellevue Hospital patients today are older persons, their average stay is longer, and the hospital mortality rate is significantly lower than was the case at the turn of the century, according to a statistical analysis of admission trends at Bellevue Hospital, New York City, published in the current issue of Hospitals, the journal of the American Hospital Association.

Association.

Basing their conclusions on analyses of two five-year periods (1923–1927 and 1935–1939), Beatrice Kresky, M.S., and H. M. C. Luykx, M.S., report an increase of nearly 50 per cent in the total number of admissions to Bellevue, despite a decrease of 14 per cent in the population of the Borough of Manhattan, and an increase of only 25 per cent in the City of New York during the same period.

Despite this increase in admissions, hospital mortality has shown a sharp decline. Meanwhile, the average age of patients increased more markedly than the figure for population gains, with a significant gain in the number of cases treated for diseases of the cardiovascular system and diseases of nutrition and the endocrine system. Correspondingly, there was a decline in the proportion of patients suffering from rheumatic heart disease, infectious diseases, and diseases of the central

nervous system.

The study, according to the authors, suggests the importance of making adequate plans for further changes in admission trends.

## DOAK CO.,INC. CLEVELAND, OHIO

Participating as organized individual units in The Fourth War Loan drive, Yonkers' four major hospitals accepted an aggregate of \$440,000 for the purchase of one ambulance plane each.

The institutions were: St. John's Riverside, St. Joseph's, Yonkers General, and Yonkers Pro-

fessional hospitals.

Plans for their participation were formulated by Mrs. Frank Smart, chairman of the Women's Division of the Yonkers War Finance Committee, and William J. Witte, a member of the Finance Committee's executive body.

The airships, C-3 ambulance planes, are built to carry fifteen to twenty litters of wounded and are complete with field packs containing blood plasma, medicine, narcotics, and bandages. Each plane

will be named for the sponsoring hospital.

In charge of the hospital campaigns were: St. John's—Mrs. E. A. Fitch and Mrs. A. N. Benedict; St. Joseph's—Mrs. R. R. Ballantoni, president of the hospital's auxiliary, Mrs. Terence J. O'Neill, and Mrs. Francis Giordano; Yonkers General—John C. Kelly, president of the hospital's board of John G. Kelly, president of the hospital's board of directors; Mrs. John E. Heintz, in charge of the junior committee; Yonkers Professional—Miss junior committee; Yonkers Professional—Miss Florence Bracken, superintendent of nurses, who will announce her assisting committee shortly.\*

### INDUSTRY LOOKS TO CASUALTIES FOR MANPOWER

Modern Industry informs its readers that more than 800,000 servicemen were discharged from hospitals and service camps during 1943-and intimates that more than a million will be discharged this year. All these, says the editor, are potential manpower for U. S. industry. The chief problem, however, is how to deal with mental and nervous disorders—the number one war casualty.

Jobs will have to be analyzed again to see where these men fit. Employment standards will need rewriting. A new human relations approach will

have to be adopted.

Until Victory Day, when general demobilization gets under way, returning service men will be of two kinds.

The first are the battle casualties with physical injuries or severe nervous shock, or both. require treatment in Army and Navy hospitals and will not be discharged until progress has been made toward their rehabilitation. Plastic surgery, physiotherapy, psychiatric treatment, and above all occu-pational therapy are now used to rebuild scarred bodies and confused minds, and to restore lost confidence.

The second group of returning men are those discharged from training camps and embarkation points behind the battle lines as unfit for military service. Rejection in these cases may result from physical limitations—heart, lungs, feet, stomach ulcers; from mental instability—anxiety complexes, phobias, etc.; or from inability to make the mental and social adjustment to army life.

Many problems and inconveniences are involved in re-employing nervous cases. But the majority of companies have enough variety of jobs and

facilities to tackle the matter.

"And thus," points out the article, "they have the opportunity to work a real miracle in human relations. All psychiatrists agree that the quicker a nervous case gets back into steady, agreeable work, the sooner he will be completely normal. Delays, promises of pensions, public over-concern can permanently undermine self-respect and selfconfidence and create a permanent public charge out of a man who could have been an independent, self-respecting asset to industry

"A job in industry at a living wage will do more to rebuild an ex-soldier or ex-sailor than all the money, charity, and public care which we can possibly provide."

The Association of Private Hospitals, Inc., of New York City, announces the election of the following officers for the year 1944: president, E. John Dolan, M.D., F.A.C.S.; vice-presidents, Albert Fritz, M.D., Alexander Kaye, M.D., F.A.C.S., Max S. Rohde, M.D., F.A.C.S., Morris Mason, M.D.; scorndery-transurer, Oscar Gottfried. M.D.; secretary-treasurer, Oscar Gottfried.

The Binghamton Sun of January 18 carried the following announcement:

Transfer of title to the Bradford Lord Memorial Hospita prc hai

ing
was speeded last night through a
City Council. Thus the closing of an institution "
It years has played an important part in the rehabilitation
of children crippled by illness is to be followed at once by a
move to provide adequate and modern quarters for upward of
350 youthful members of Endicott's rapidly expanding Boys
Club. . . . .

В.

Kingston Hospital will receive a share of a donation of \$1,000,000 received by the United Hospital Fund from a trust fund established in 1937 by Jacob H. Schoonmaker, of New York City, who died October 2, 1943.

The gift, to be known as the Jacob H. and Emms W. Schoonmaker Fund, has been invested and the resultant income will be added to the annual collection of the Hospital Fund, which is distributed among the eighty-seven member hospitals and home.

The rest of the original trust set up in 1937 has been divided among the Community Service Society of New York, New York Foundling Hospital, Fordham University, and Kingston Hospital.\*

Dr. Eugene W. Bogardus, since 1940 superintendent of the Onondaga Sanatorium in Syracuse, [Continued on page 556]

### THE MAPLES INC., ROCKVILLE CENTRE, L. I.

A sanitarium especially for invalids, convalescents, chronic patients, post-operative, special diets, and body building. Six acres of land-scaped lawns. Five buildings (two devoted exclusively to private rooms). Resident Physician. Rates \$18 to \$45 Weekly

### KEEPING UP-TO-DATE ON NEW **PRODUCTS**

An article in Modern Hospital (by Richard Highsmith, Administrative Assistant, Evanston Hospital, Evanston, Ill., Jan. 1944) calls attention to the filing of material received in the mail from

pharmaceutical houses for valuable reference. States the article—"The amount of literature received from pharmaceutical houses has increased to a point where the problem of filing it demands some careful thought. . . . Although much of the printed matter circulated deserves no better resting place than the wastebasket, there is a goodly por-tion which can be of inestimable value to both the pharmacist and the physician. Contained in the better write-ups are concise summaries of products, including clinical use, dosage and package information, which enable the physician to review quickly the salient points of a drug without covering voluminous works.

"The problem of filing the publications after they have been selected from the general run is essentially one of determining the kind and extent of filing method to employ. Being a library procedure the number of ways in which the material may be classified are many. . . In keeping with this thought, a convenient system has been devised which amounts to a modified alphabetical method.

"Since an analysis of the total material to be preserved reveals that a greater portion is published by four or five major companies, it has been found desirable to maintain separate and distinct alpha-

betical files for each company. The material from the other companies is then pooled and alphabetized as a whole."

### PHOSPHORS IN THE FUTURE-AN-OTHER ONE OF TOMORROW'S MAGICS

Performing practically miraculous tasks, the future for phosphors includes inexpensive fluorescent lamps for factories, offices, and homes: varicolored street signs; lights for television screens tuned by electronic indicators; microscopic screens for bacteriological and chemical research; intense light sources for sound recording and theatre projection; luminescent walls, ceilings, and murals that illuminate and decorate rooms; luminescent plastics; and radiations for controlled treatment of living tissues and organisms. These are but a few of the possible applications of phosphors foreseen as a result of new developments.

Tiny synthesized crystals, phosphors cannot only transform invisible radiations (cathode or ultraviolet rays) into visible light, but can also store light or "remember" information for more than a day, and can convert electric power into white or colored light more efficiently than any

known practical means.

[Continued from page 554]

has resigned, effective March 1, to become head of the medical department of the Reader's Digest Co. at Pleasantville, New York, it has been announced by Dr. H. Burton Doust, chairman of the board of managers of the institution.

During Dr. Bogardus' years at the Sanatorium, tuberculosis treatment programs were expanded to include modern surgical collapse procedure, and the x-ray and clinical laboratories were completely renovated, along with numerous adjuncts to the work and facilities of the institution. The educational program among school children was extended to include high as well as grammar schools.

Dr. Bogardus was graduated from Syracuse University College of Medicine in 1926. He served an internship at Crouse-Irving and University hospitals, and practiced medicine in Syracuse from 1927 to 1929.

In May, 1928, he began a course at Trudeau School, Saranac Lake, in tuberculosis work and a year later was appointed associate director of the Tuberculosis Division of the State Health Depart-

During 1930 and 1931 he attended Johns Hopkins University, where he won a master's degree in public health. He then became director of the division of tuberculosis of the Westchester County Health Department, a post he held when named to the Onondaga Sanatorium superintendency.\*

Children's Hospital, in Buffalo, celebrated its fiftieth anniversary in 1943 with a varied program. The hospital staff entertained the board of

managers at dinner one evening, and they discussed together the work of the hospital and the aims of the institution. City newspapers gave excellent publicity and merchants gave space in their advertisements and windows to tell of the hospital's half-century of work. Radio stations gave time for programs put on by the staff, the board, and other friends of the hospital, and for five Sundays staff members gave public lectures on child welfare subjects.

The week of November 29 was declared "Children's Hospital Week" by the mayor of Buffalo, and many clubs, mothers' groups, church groups, and other organizations visited the hospital for an open house. Exhibits by the various department heads showed the work of the hospital; and doctors and board members appeared before many groups to describe the work.

Through benefits, several groups put at the disposal of the hospital an adequate equipment fund.

Little Falls Hospital celebrated its fiftieth anniversary on November 15, 1943.

The National Council of Jewish Women has made a gift of \$10,000 to the U.S. Naval Hospital at St. Albans, Queens, New York.\*

The new Massena Memorial Hospital was opened for inspection on January 2 and for receiving patients

Miss Mildred Higgs, former superintendent of Van Duzee Hospital, Gouverneur, is superintendent.\*

### "OUOTES"

"When Hitler hitched his chariot to an internal combustion engine, he ran it straight down our

-Lt. General Brehon Somervell

"According to one high-priced advertising writer who operates in a kind of fervent free verse on the pages of our slick magazines . . . all the American soldier thinks about as he goes into battle is the necessity of keeping America absolutely unchanged after the war. This sounds to me much more like the thoughts of a high-powered advertising executive as he sits down to fill out his income-tax blank than an infantryman jumping out of a landing barge into the surf on the beaches of Europe. The infantryman, I can assure the silver-penned copywriter, is more than willing to have a changed America when he finally shows up again in San Francisco or Newport News. For one thing, it seems like a gloomy waste of time and effort to spend two or three or four years under the brutality of sergeants, away from home, being bombed, machinegunned and mortared, merely to come back to exactly what you had before. It was good,

brother, but it wasn't good enough."

—Pvt. Irwin Shaw, playwright
(author of "Bury the Dead" and "The Gentle People"), now in army.

"Constructive criticism is like a layer cakeremember the frosting on top, and the tasty filling between layers, and the sugar mixed throughout the batter.'

-Donald A. Laird, Ph.D., Sci.D

# the EXTRA FACTOR

# in mucous membrane antisepsis

Should an antiseptic be antiseptic only? Or should mucous membrane medication be only contra-congestive? Can any one preparation have BOTH these properties, yet combined with them the more important characteristic of stimulation of tissue defense mechanism?

• The single purpose of most antiseptics is germ destruction. But toxicity to germs of most antiseptics is coupled in much too great a degree with toxicity to membranes—and such toxicity in an antiseptic is especially undesirable when treating infections of the mucous membrane.

ARGYROL provides both antisepsis and decongestion. ARGYROL is protective, detergent, pusdislodging, inflammation-dispelling. ARGYROL is the physiologic antiseptic. Write for book on Clinical Application. Please insist on ORIGINAL ARGYROL PACKAGE in ordering or prescribing.

# New—simplified Hay-fever technique

Only 1 package for Eastern or Western.

# **POLLIGENS**

Lederle

# DESENSITIZATION BY BOTANICAL FAMILY

"POLLIGENS Lederle" provide a new, simplified procedure for the diagnosis and treatment of hay-fever, involving only four antigenic extracts. These extracts are effective in approximately 90% of all hay-fever cases.

All members of a botanical family form in their pollens a common antigenic substance. An extract containing such antigenic substance may be used for desensitizing against any or all pollens in the same botanical family.

"POLLIGENS Lederle" are standardized extracts containing the antigenic substance common to each member of the four significant families of pollinating plants.

Send for literature explaining this new, streamlined method of diagnosis and treatment.

Clinical experience and carefully controlled studies in humans have definitely proven the value of Theobromine Sodium Acetate in treating certain Cardiovascular and Renal diseases, and the value of the enteric coating in permitting adequate dosage without causing gastric distress.

Supplied—in 7½ grains with and without Phenobarbital ½ grain; in 5 grains with Potassium Iodide 2 grains and Phenobarbital ¼ grain (cost approximately \$1.50 per bottle of 100 tablets); and in 3¾ grains with and without Phenobarbital ¼ grain (cost approximately \$1.00 per bottle of 100). Capsules, not enteric coated, are available in the same potencies for supplementary medication.

\*Literature giving confirming bibliography, and physicians samples will be furnished on request

### BREWER & COMPANY, INC.

Worcester Massachusetts

Many vitamin deficiencies, like fish, run in schools—more than one deficiency to a patient.

For treating multiple vitamin deficiency, you have a potent ally in IMPROVED Ol-Vitum—the "8-Vitamin" Capsules. Each Ol-Vitum capsule is complete as far as accepted daily requirements are concerned.

Each capsule contains the following 8 vitamins—A, B<sub>1</sub>, B<sub>2</sub>, B<sub>5</sub>, C, D, Niacin Amide and Pantothenic Acid. Each capsule supplies the following ratio to minimum daily requirements:

Adults & Children	Children 6 to 11
over 12 yrs.	years, incl.

Vitamin	A	.125%	166%
Vitamin	B,	.150%	200%
Vitamin	$B_2(G)$	.100%	*
		.100%	
		.250%	

\*Requirements not established

(Minimum daily requirements for Niacin Amide or need in human nutrition for Vitamin  $B_{\mathfrak{c}}$  or Pantothenic Acid not established.)

IMPROVED Ol-Vitum Capsules are a most convenient way to assure adequate vitamin intake inexpensively. They are a product of "The House of Vitamins." International Vitamin Corporation are leaders in the research and production of vitamin products. They specialize solely in vitamin manufacture—have never made anything but vitamin products,

# Carnacton of clinical value

In Angina Pectoris • Arteriosclerosis • Peripheral Vascular diseases

Carnacton is a biologically tested extract of highly vascularized and active diaphragmatic muscle with a high metabolic rate... providing dependable vasodilator and depressor benefits. Carnacton helps establish collateral circulation and promotes cardiovascular tone and vitality.

Ampuls of I ec. and 2 cc.—boxes of 12 and 50; vials of 30 cc. for oral use. For detailed brochure address Dept. N.

CAVENDISH PHARMACEUTICAL CORP., 25 West Broadway, New York

otherapy makes possible a high topical concentration of dissolved sulfathiazole throughout the entire oropharyngeal area—and for prolonged periods. Yet even with maximal dosage—and even in children—blood levels of the drug are so very low that there is minimal risk of the untoward reactions frequently associated with systemic treatment with sulfonamides.

One tablet, chewed for one-half to one hour, promptly initiates a high salivary concentration of locally active (dissolved) sulfathiazole—and maintains throughout the maximum chewing period an average concentration of 70 mgm. per cent.

Yet an average adult, chewing a total daily dosage of 8 tablets, for as long as an hour each, does not develop a blood level of sulfathiazole greater than 1 mgm. per cent.

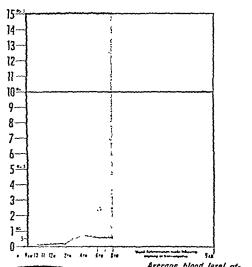

The advantages of this new technique for treatment of sulfonamidesusceptible infections of oropharyngeal areas are obvious. White's Sulfathiazole Gum is supplied in packages of 24 sanitaped tablets, in slip-sleeve prescription boxes—on prescription only. White Laboratories, Inc., Pharmaceutical Manufacturers, Newark 7, New Jersey.

Generally maintained blood level in systemic therapy: 5 to 15 mg, percent average (10 mg, percent).

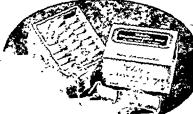

Chart contrasts sulfonamide blood level commonly maintained in systemic treatment, with that attained even with maximal dosage of Sulfathiazole Chm White area represents the sulfathiazole blood levels in an experimental of the sulfathiazole blo

in an experimental group of children

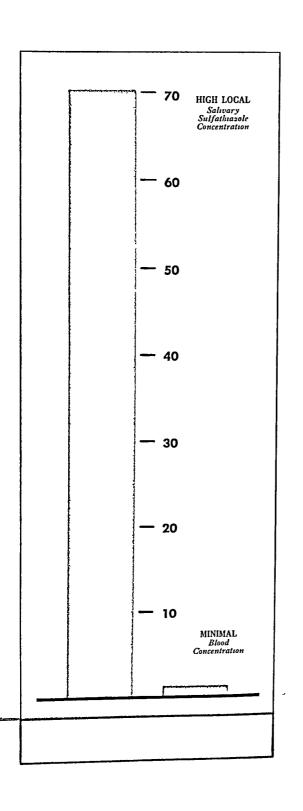

similar low blood levels were attained. Since, in systemic therapy with sulfonamide compounds, blood levels of 5 to 15 mgm % (averaged in green portion of chart as 10 mgm %) are generally maintained, the use of White's Sulfathizable Gum—even with maximal dosage—virtually obviates toxic reactions frequently associated with systemic treatment.

#### OF HOPE...

## for today's CARDIOVASCULAR PATIENT

As the result of recent studies, 1, 2, 3 a more aptimistic prognosis now prevails for patients suffering with cardiovascular disease. The modern classification of such pathology as an acute or subacute condition — rather than as a chronic one—establishes the attainable objective of symptomatic relief, with avoidance of undestrable side reactions.

This is capably accomplished, in many cases, with Calpurate—a chemical combination of calcium theobromine and calcium gluconate which . . .

Eases venous congestion through vasodilating and divretic action, and

Increases cardiac output through myocardial stimulation

Of clinical importance... because Calpurate has the advantage of being almost insoluble in the stomach, yet readily absorbable by the intestine, it is remarkably free from gastric irritation.<sup>4</sup>

Calpurate is especially indicated in angina pectoris, cardiac edema, coronary sclerosis, Cheyne-Stokes respiration, and paroxysmal dyspnea.

Dosage: 1 or 2 tablets, or 7 to 15 gr. pawder

Packaged: As tablets (each containing 7½ gr. calcium theobromine — calcium gluconate), in bottles of 100, 500 or

1,000—or as powder in 1 oz. bottles. Also available, with ½ gr. phenobarbital added per tablet

# SULFADIAZINE

THE OFFICE of the Surgeon General, U. S. Army, has recommended Sulfadiazine for the oral specific treatment of such hemolytic streptococcal infections as—

ERYSIPELAS

CELLULITIS

TONSILLITIS

OTITIS MEDIA

STREPTOCOCCAL MENINGITIS

SEPTICEMIA

**ACUTE MASTOIDITIS** 

ACUTE STREPTOCOCCAL OSTEOMYELITIS

THE COMMITTEE on Chemotherapeutic and Other Agents and the Committee on Surgery of the Division of Medical Sciences, National Research Council<sup>2</sup>, have recommended Sulfadiazine as the drug of choice for oral therapy in the postoperative treatment of wounds. Such wounds are classified broadly as—

OPEN WOUNDS PENETRATING WOUNDS INFECTED WOUNDS
COMPOUND FRACTURES BURNS

SULFADIAZINE administered orally is almost universally regarded as the preferred drug for the prevention and treatment of all hemolytic streptococcal infections.

# The Tyrant of Surgery - CURBED!

THE "RAMSES"\* Diaphragm Introducer, designed after consultation with gynecologists, engages the rim of the "RAMSES" Flexible Cushioned Diaphragm at two points, shaping it into an elongated oval, thus enabling it to pass readily into the vagina. By providing complete control over the direction of travel, the "RAMSES" Diaphragm Introducer assures proper and accurate placement of the diaphragm.

1. The wide, blunt tip of the "RAMSES" Diaphragm Introducer is designed to prevent even the remote chance of accidental penetration of the uterus during insertion of the diaphragm.

- 2. Made of easily cleansed plastic, the "RAMSES" Diaphragm Introducer has no minute crevices to harbour bacterial growth—no sharp projections to cause possible vaginal injury.
- **3.** The broad, rounded hooked end of the "RAMSES" Diaphragm Introducer—used for diaphragm removal—guards against possible entry into the urethra.

Your patients obtain the "RAMSES" Diaphragm Introducer when you specify the "RAMSES" Physician's Prescription Packet No. 501, which also contains: A "RAMSES" Flexible Cushioned Diaphragm of the prescribed size. A large size tube of "RAMSES" Vaginal Jelly.

# May we send you this helpful new booklet FREE for presentation to your patients?

Last year the Samuel Higby Camp Institute for Better Posture, in collaboration with eminent authorities, prepared a little booklet "Blue Prints for Body Balance" which has been supplied to thousands of physicians, free, at their request. Now we have prepared a new companion booklet which is just off the press.

This additional sixteen-page booklet, "The Human Back... Its Relationship to Posture and Health," tells its story in simple, nontechnical language, and is attractively illustrated. It is educational, non-commercial, informative... an ethical booklet for physicians to give their patients. We believe it will inspire its readers to a better appreciation of the importance of good posture and professional medical counsel.

We shall be glad to send you as many copies as you wish, free. The booklet measures 3½ by 6½ inches, and is attractively printed in color. Just use the coupon below, or write on your professional letterhead to the

# EQUIPMENT BREAKDOWN COSTLY REPAIRS INTERRUPTED SERVICE LOSS OF TIME INEFFICIENT OPERATION

# Apparatus Troubles Minimized ... When = P. I. and A.

An item of small expense ceases to be burdensome when it represents insurance against additional expenses of unpredictable magnitude, and the consequent inconveniences.

G. E. X-Ray's Periodic Inspection and Adjustment Service has so proved to thousands of users of x-ray and electromedical apparatus throughout the United States and Canada. For these users know

from experience that they can rely on G. E.'s service engineers to keep their equipment tuned up to its highest operating efficiency the year round. They know, too, that these men, when working on periodic service calls, are

ever on the alert to detect and immediately correct electrical and mechanical deficiencies at their very inception, to thus avert breakdown and probably costly repairs

that result from oversight or neglect.

The fact that our branch offices and regional service depots are strategically located throughout U. S. and Canada, makes P. I. and A. a tangible service that extends far and wide, and functions the year round in the interest of those who contract for it

and wide, and functions the year round in the interest of those who contract for it.

There are many other important phases of P. I. and A. Service which our local representative will be glad to tell you about. Write us for his headquarters address.

An intercurrent infection . . . an increased metabolic rate . . . a pregnancy . . . a surgical operation . . . a poor appetite—may sap the B Complex reserves to the danger point.

When either inadequate dietary intake or increased requirements produce deficiencies of the B factors in the body, replacement with Whole Natural Vitamin B Complex is imperative because:

- ★B deficiencies tend to be multiple —therefore Whole B Complex is indicated.
- ★ Certain factors of the B Complex are obtainable only from Nature therefore Natural B Complex is indicated.

BEZON\* is Whole Natural Vitamin B

Complex—concentrated to high potency from natural sources—no synthetic factors are added. Only Whole Natural Vitamin B Complex contains all 22 B vitamins.

BEZON is the only Whole Natural Vitamin B Complex which contains one full milligram of natural thiamine, two milligrams of natural riboflavin, together with all the remaining members of the B complex, concentrated in one capsule or two tabules. Supplied in bottles of 30 and 100 capsules; 60 and 200 tabules.

Samples and literature available on request.

### Control - the keynote in insulin action

A schematic representation of various insulins on the blood sugar of a fasting diabetic patient.

 Wellcome' Globin Insulin with Zinc, a new type of insulin, offers an advance in diabetic control. It provides a rapid onset of action; strong prolonged effect during the day when most needed; and diminishing action at night. Nocturnal insulin reactions are rarely encountered.

'Wellcome' Globin Insulin with Zinc conforms to the needs of the patient. A single injection daily has been found to control satisfactorily many moderately severe and severe cases of diabetes. 'Wellcome' Globin Insulin with Zinc, a clear solution, is comparable to regular insulin in its freedom from allergenic skin reactions.

'Wellcome' Globin Insulin with Zinc is accepted by the Council on Pharmacy and Chemistry, American Medical Association, and was developed in the Wellcome Research Laboratories, Tuckahoe, New York. Registered U.S. Patent Office No. 2,161,198. Available in vials of 10 cc., 80 units in 1 cc.

# The voluntary choice of remaining at home during two or three

The voluntary choice of remaining at home during two or three days of the menstrual period cuts sharply into the attendance of many women at critical war work.

In special cases, the need for discriminating therapy—analgesic, hormonal, emmenagogic, even surgical—may justify home confinement.

But for so many, absentecism is motivated solely by a desire to avoid the risk of physical distress and emotional uncertainty, caused by vulval irritation from perineal pads... or by fear of olfactory offense... or conspicuous bulging under slacks or coveralls.

That such risks can be safely avoided by the use of Tampax menstrual tampons has been known for years by thousands of women in all walks of life—in the theater, in sports, business or social life. For them, this improvement in menstrual hygiene has provided a genuine aid to uninterrupted activity.

They have found that Tampax is free from the prospect of vulvovaginal irritation. It cannot cause noticeable bulkiness, or expose the flux to odorous decomposition. Its three absorbencies permit selection, to meet personal daily needs, amply and safely.

Compression in a one-time-use applicator facilitates insertion without orificial stress, and exclusive flat expansion assures comfortable accommodation in situ. Special cross fiber stitching prevents disintegration of the tampon, so that dainty removal may be effected without probing.

Today the Tampax habit becomes-more than ever-the logical one for adoption . . . and for professional recommendation.

#### A Call for Action

In an open letter to American employers, the Reader's Digest<sup>1</sup> condenses from Forbes Magazine a very pertinent appeal by Austin M. Fisher, well-known labor consultant, under the title "Insure Your Workers' Read it, doctors of medicine! You have medical expense indemnity insurance for sale. It is medicine's own plan, but it won't sell itself. It must be sold like any other form of insurance. It will appeal to employers and to working men alike because it has the approval and whole-hearted backing of physicians. And in the final analysis. the doctors are the ones who must make any insurance plan work, medically. You can plan any sort of clock, for example, but it won't run well without the works, no matter how much it may look like a clock. Congressional Record please copy. We quote Mr. Fisher in part:

Eric Johnson, President of the U.S. Chamber of Commerce, has been saying to his fellow businessmen, "Gentlemen, we know free enterprise can work. It's up to us to see that it does..."

... if free enterprise is going to survive, it will have to provide a progressively modern standard of living for working people and at the same time give them reasonable seturity against the hazards of disability, old age, death, and unemployment

ability, old age, death, and unemployment.

Let's look at one of the sorest spots in our industrial body: the loss of income due to sixtness.

trial body: the loss of income due to sickness.

The average industrial worker today earns about \$44 a week. Whether you like it or not, he isn't taving much of that; and in normal times, with a lower income, he saves practically nothing. The average male worker loses seven to nine days a year, and the average female worker eight to twelve days, because of illness....

A study made by the National Industrial Conference Board shows that the cost of providing sickness benefits for employees varies from 0.0025 per cent to 1.7 of the annual payroll.

Striking squarely at the heart of the matter Mr. Fisher warns employers:

Unless you do something about it first, the political representatives of your workers are going to do it for you and with your own money. They may put through a payroll health insurance tax. Under any administration, Democratic or Republican, that tax would be collected by thousands of new federal jobholders who would spend millions of dollars "administering" the plan and in building up a loyal following for the next politician who is smart enough to beat you to the punch.....

This warning applies equally to the medical profession, in our opinion. Medical expense indemnity insurance will not sell itself even with such able assistance as Mr. Fisher's letter to employers.

The medical and hospitalization provisions, Title IX, of the Wagner-Murray-Dingell bill (S. 1161; H.R. 7534) present the picture of what may be expected if free enterprise fails. And, under date of February 17, the New York Herald Tribune<sup>2</sup> reports:

The British government proposed today a postwar national health scheme envisaging free medical health service for every person in the country at a total cost estimated at £148,000,000 (\$592,000,000) annually.

annually.

The "health charter," which was presented to the House of Commons in a White Paper, represented the government's first move in the struggle over the controversial Beveridge Plan.

The main points in the plan, which will be debated in the House within the next three weeks, are free doctors, drugs, medicines, hospital treatment, and consultants' advice....

#### But----

From the Supplement to the New Zealand Medical Journal<sup>3</sup> Mr. W. F. Buist,<sup>4</sup> in discussing future medical services, says, in

ut so far I have learned of no other suggestion which provides the necesety valve which such an arrangement would give. It would be tragic if a lot il business concerns were wrecked and vorkers thrown into idleness because of nability to cut through the red tape ed in getting their claims settled.

RESPONSIBILITIES OF CONTRACTORS

r the following points! terminated contracts should be setlegotiation by the confirmating agenhe Government, and the negotiated int should be final in the absence or misrepresentation. Let int partial payments amounting to

4. Contracting agencies should be required to give prompt clearance of claims on work in process. There should be clear-cut procedures for authorizing the removal of Government-owned inventories and machines, with storage at Government expense, in order that civilian production may be started.

5. The dilemma of the subcontractors must be resolved. At the present time the Government exercises the right of approving all payments in settlement of subcontracts but does not assume any responsibility to the subcontractor, with the result that the subcontractor in many cases cannot secure action by either the prime contractor or the contracting agency. I suggest that the local settlement committees proposed above should be empowered to approve settlement of subcontracts if a delay occurs in approval by the contracting agency.

#### B. DECONTROL OF MATERIALS

1. As soon as warrounditions permit, the rules for the relies of poarce raw materials should be raying the with a view to facilitating the rapid recumption of civilian gloduction.

#### A Magnificent Job

EXTENSION OF REMARKS

#### HON. LOUIS LUDLOW

OF INDIANA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, January 11, 1944

Mr. LUDLOW. Mr. Speaker, Indianapolis and Indiana are very proud of the great pharmaceutical house of Eli Lilly & Co., which has processed its millionth blood donation without a cent of profit. This record is in keeping with the fine, generous spirit which this firm always has manifested in the service of our country and which long ago brought to it the recognition of an Army-Navy E award. Commenting on the com-pany's contribution to the blood campaign, which means so much in saving the lives of our precious boys, the Indianapolis News says editorially:

#### LILLY'S CONTRIBUTION

In the midst of charges that some concerns are making an unholy profit from war contracts it is heartening to learn that the Indianapolis laboratories of Eli Lilly & Co. have processed 1,000,000 blood donations entirely on a nonprofit basis.

In addition to performing this service at cost, the expense involved has been decreased constantly through the introduction of more efficient methods.

There certainly could have been nothing unethical if the Indianapolis pharmaceutical

house had sought a minimum profit for the

work it has been doing.

Donations of blood at Atlanta, Chicago, St. Louis, Detroit, Cincinnati, Louisville, Columbus and Indianapolis have been converted into live-saving plasma at the Lilly plant, involving the installation of new equipment and the employment of much additional

A SOLEMN OBLIGATION But the League did not give its con But the League di

that the meetings of your representative bodies be well attended, that you inform yourself of the issues to be decided, that you show by your attendance at meetings, and especially at the Annual Meeting of your State Society, that you, personally, are actively interested in carrying on for yourself and for your absent colleagues.

This is the third year of war! Upon us who serve on the civilian front the stresses and pressures are increasing mightily. is becoming harder to find time to attend meetings, harder to travel, harder to keep up not only with the innumerable scientific advances accelerated by the war but also with the study of the public responsibilities of medicine, the public relations of your associations with the people and their government. The people, the voters, your patients can have what kind of medical care and medical practice they want. can have it because the powers of government in this nation still remain in their hands, secured by the Constitution. You, as the trusted physicians of the people, can advise them. You have created the standards of medical practice which they now enjoy. You have fought to maintain those standards against all who would lower them or tear them down. This is your fight; the fight you, personally, are committed to carry on for yourself and your absent brothers, and for the people of the nation; the fight you have waged for many years but which now requires of you greater personal attention and sacrifice of time and effort, because of your absent brothers. You represent them now.

595

You will not fail the absent colleagues who rely on you; you will not fail the public which trusts you to study scientifically, sympathetically, the revisions in medical thought and practice which may be necessary in the public interest, in the public welfare.

You will attend the Annual Meeting, May 8-11, 1944, in greater numbers than ever; you will inform yourselves of scientific matters; you will contribute as you always have in your scientific papers to the steady progress of the art; you will talk with many people and listen to what others have to say; you will encourage and support your county society delegates by your presence, and by your interest compensate the exhibitors, who, year after busy year, contribute their full share to the continuing success of the Annual Meeting.

Buy more War Bonds and mark your calendars now!

#### Employment of the Physically Handicapped

It may be expected that physicians acting as consultants to industry or as front-line medical men to small plants or groups of small plants will be asked about the employability of the physically handicapped.

In this country there are now approximately 133,000 totally blind, and more than 425,000 persons blind in one eye. "An estimated 65,000 are totally deaf, 60,000 are mutes, and 1,547,000 are classified as hard of hearing. Approximately 3,700,000 suffer from a cardiac condition and 680,000 have tuberculosis, according to recent estimates, while 2,500,000 persons in the United States are afflicted with orthopaedic handicaps."

In view of the growing manpower shortages, and in the interest of the rehabilitation of these physically handicapped

persons, industry is making every effort to absorb them into useful productive occupations.<sup>2</sup> It is of the greatest importance that physicians should realize the large number of occupations in which these persons may safely be utilized. A suggestive list:

Persons with amputation of one arm
Electrician and inspector
Master mechanic
Foreman
Clerical checker
Machine operator
Stockman, storekeeper
Watchman, guard, policeman
General inspector
Persons with amputation of one leg
Grinder and polisher
Ordnance man
Toolmaker
Welder, gas and electric
Cutter
General inspector

part, of the government scheme now operating in New Zealand:

The system is top-heavy, cumbersome, and entails not only departmental clerical work but a similar position as far as doctors are concerned—too large a proportion as compared to the legitimate function of curing the sick. I can only repeat that a better and simpler method can be evolved by a more sympathetic attitude towards the profession. However, "exploitation" comes into the picture. This is probably quite true. But by seeking more cooperation with the profession such abuses could be stifled.....

When one turns to reports of what is happening overseas—at home and in other parts of the British Empire—the salient feature is a general agreement that any alteration in the medical services will not take place until after the war. Another interesting commentary is that the various Ministries of Health are discussing matters with official bodies of the medical profession, and that means that medical planning for the future is the order of the day.

In Australia, after a thorough investigation by a Parliamentary Committee and various official medical bodies, a Medical Planning Committee has been set up by the Federal Council and an organiser appointed. The immediate result is that a unanimity of medical opinion covering the whole of Australia has been obtained. It has also been agreed that any method of service to be evolved shall definitely adhere to the principle of retention of private practice. The idea of group practice is being considered but it is pointed out that it is not easy to establish group practice and that this must be done aradually.....

Here speaks the voice of experience with government-imposed systems of medical practice, the alternative to American medicine's proposed medical expense indemnity insurance for this nation, supported by free enterprise and free men.

It is not reasonable to assume that what has come to pass in Britain, in Australia, in New Zealand, in Canada will not happen here. To talk about free enterprise is not enough. To offer medical expense indemnity insurance is not enough. It must be sold to employer and employee, alike—and preferably by those who know how to do it. That problem has to be squarely faced, with no ifs, ands, or buts about it. Why not now? If you are sick, call in a good doctor; if you have something to sell, employ a good salesman; but don't invite the salesman to diagnose illness or a doctor to sell insurance; otherwise you may have to compromise by accepting a politician as a substitute for both.

#### Annual Meeting

Spring! In New York City. At the Hotel Pennsylvania. Does it suggest anything to you, Doctor? Look up from that income tax blank with which you are wrestling just for a moment; look out of the window at the pussy willows or the blizzard, or the sleet storm or whatever happens to be the scene at the moment.

Have you forgotten something? War Bonds? Aunt Mary's birthday? Your wife's anniversary present? The letter she gave you to mail last week? The call on Mrs. Jones you promised to make day before yesterday? Physicians' registration fee? County Society dues? None of these? There must be something—

Ah! In January in these columns we asked you to mark off in your appointment book, or on your calendar, the date of the Annual Meeting, May 8-11, 1944. Did you do it? Certainly you did! If you didn't just happen to be too busy at the time to read your Journal; or if you were

in the armed services; or just too weary to read anything or to remember anything you had read.

Maybe, however, you were interrupted as you were about to mark your calendar or your engagement book for the dates of May 8-11, Annual Meeting, Hotel Pennsylvania, New York City. So, do it now!

Much medical history is in the making. Important decisions must be made this year which will be far-reaching in their ultimate effect on the practice of medicine.

It is the duty of every one of us who can to help make those decisions correctly in the public interest. Your colleagues who are serving the nation in the armed services have confidence that you will not fail them, that you will make it your duty to represent them in the meetings of your county societies, your state and national associations. If they cannot count on you, on whom can they rely? It is more than ever necessary

Chairman, Medical Planning Commission.

#### THE NARCOTIC PROPERTIES OF CARBON DIOXIDE

M. H. Seevers, Ph.D., M.D., Ann Arbor, Michigan

It Is no novelty to state that carbon dioxide has narcotic properties. Most anesthetists are familiar with the fact that Hickman¹ advocated carbon dioxide as a general anesthetic in the first part of the last century and that Paul Bert² studied the gas extensively in animals as early as 1878. Probably most physicians consider this information to be largely of academic interest, since the terms carbon dioxide and respiratory stimulation have come to be almost synonyms in medical teaching. The point of view that narcotic concentrations of carbon dioxide can be attained only by using the compressed gas from a cylinder has many adherents even among medically trained anesthetists.

Such being the case, it may be worth while to point out some of the evidence about carbon dioxide which is difficult to reconcile with such a point of view. For it is probably true that a busy anesthetist, even the most expert, has difficulties with carbon dioxide almost every day of his life and uses narcotic concentrations of this gas intermittently, or in some instances regularly. whether he is aware of the fact or not.

Undoubtedly the discussion which follows will be of interest primarily to those who are determined to conduct anesthesia in such a manner that the patient is required to make minimal biochemical and physiologic readjustments even though it becomes necessary to modify existing technics in order to accomplish such an objective.

Those who have never attempted to respire 5 per cent carbon dioxide for an extended period of time have missed a disagreeable experience. If one is able to voluntarily respire 10 per cent carbon dioxide for more than a few moments he possesses more fortitude than the most. If he can retain consciousness after breathing 10 per cent carbon dioxide for fifteen minutes, I would suspect him of having a compensated respiratory acidosis from emphysema or some other allied respiratory ailment.

Yet there is good evidence to prove that we expose patients under anesthesia to these and higher concentrations of carbon dioxide with greater regularity today than yesterday, and that it is not always to the advantage of the patient to do so. Widespread use of the newer drugs and modern closed technics of administration have un-

Read by invitation at the Annual Meeting of the Medical Society of the State of New York, Buffalo, May 4, 1943. From the Department of Pharmacology, University of Michigan Medical School, Ann Arbor, Michigan. doubtedly increased the incidence of such exposure. Since patients under anesthesia differ from normal human subjects in that they are no longer capable of objecting to the disagreeable procedure of respiring high concentrations of carbon dioxide, their biochemical and physiologic resources must be marshalled to compensate for this overt threat to their security. If these resources have been greatly reduced during a recent bout with disease the added burden may be too great. During anesthesia with the older agents, administered by open or semiopen methods, as with the normal unanesthetized subject, an increase in the minute volume of respiration can parallel the increase in carbon dioxide in inspired air, so that the blood concentration of carbon dioxide is not increased appreciably. Complete compensation to 5 or 6 per cent carbon dioxide can occur in this fashion. If the respiratory mechanism cannot respond, or if the patient is forced to rebreathe a portion of his last expiration, an increase in the blood carbon dioxide with its effect on the acid-base equilibrium is inevitable. A few examples are cited to strengthen this case. Undoubtedly respiratory acidosis is a common occurrence in evipal and pentothal anesthesia. since these drugs depress respiration significantly.3 But these drugs are not specific, since any barbiturate, opiate, alcohol or, in fact, any depressant drug may bring about a similar result. In cyclopropane anesthesia administered clinically by the carbon dioxide absorption technic, it is a regular occurrence to find a carbon dioxide tension of 75-80 mm. and a pH of 7.15-7.20 in arterial plasma.4 This means that the blood is equilibrated with 10 or 11 per cent carbon dioxide in alveolar air, concentrations which are agreed to be narcotic by all those who have studied the problem on normal unanesthetized human subjects.

Figure 1 summarizes the principal data dealing with the effect of various concentrations of carbon dioxide on man.<sup>5-15</sup> Study of this chart will reveal that certain evidences of narcosis are present even with concentrations of carbon dioxide as low as 5 per cent; that 10 per cent is the absolute upper limit of tolerance if consciousness is to be retained; and that anesthesia of a sort occurs with 25 to 30 per cent carbon dioxide.<sup>5</sup> It is not good anesthesia, of course, since it is accompanied by convulsive phenomena. It is our purpose to discuss the effects of these high concentrations of carbon dioxide but especially those

Even from this very meager list, it becomes apparent that opportunities in business and industry for the physically handicapped are limited seemingly only by the amount of constructive imagination applied to their peculiar problems. This is a field in which physicians can and will be of the greatest assistance to industrial manage-The problem is one which calls for the highest quality of medical and surgical skills, cooperative, constructive ingenuity on the part of physician and management, and the assistance of federal, state, and local agencies concerned with the rehabilitation and re-employment of those already handicapped as well as the returning veterans and the veterans' organizations.

#### Hotel Reservations

Members of the Society who expect to attend the Annual Meeting May 8-11 should make reservations as soon as possible at the Hotel Pennsylvania in New York City. Write to Mr. James H. McCabe, Manager, Hotel Pennsylvania, New York, New York.

The following information concerning room accommodations and prices has been supplied by the Hotel:

Each room has a private bath—shower or tub and shower.

Room for one person per day—\$3.85, \$4.40, \$4.95, \$5.50, \$6.05, \$6.60, \$7.70.

Room for two persons per day (with double bed)—\$5.50 (shower only), \$6.05,

\$6.60, \$7.15, \$7.70, \$8.25, \$8.80. Room for two persons per day (with twin beds)—\$6.60, \$7.15, \$7.70, \$8.25, \$8.80,

\$9.90.

Suite (living room, bedroom, and bath)—\$10.00, \$11.00, \$13.00, \$18.00. For more than two persons in a double- or twin-bed room the extra charge is \$2.00 per day per person.

<sup>1</sup> Illinois M. J. 85: 1, 47 (Jan.) 1944. 2 Industrial Relations Bulletin, Natl. Assn. of Manufacturers, q.v.

the clinical point of view deals with concentrations of carbon dioxide between 5 and 10 per cent. There is considerable evidence to support the concept that even these levels may be depressing under many circumstances. Mental depression, ataxia, dizziness, and fatigue follow prolonged exposure to 5 and 6 per cent carbon dioxide in the normal human subject. Since it is not clear to what extent carbon dioxide at these levels alters the course of events during anesthesia, a series of experiments on animals designed to furnish evidence along these lines were undertaken.

Many investigators have studied the toxic and narcotic effects of carbon dioxide on normal animals following sudden and gradual exposure.16-21 There is fairly good agreement that concentrations of 10 per cent or less do not possess detectable narcotic action: that concentrations above 30 per cent will induce narcosis in most animals; and that concentrations of 40 per cent and above produce pulmonary edema, hemorrhages from exposed mucous membranes, and death within a relatively short time. Herbiverous animals, such as the rabbit, will tolerate somewhat higher concentrations; in fact, will survive even 80 per cent carbon dioxide for a period of fifteen minutes.16 Hibernating animals, such as the marmot, are very resistant to high concentrations.22 There is considerable information in the literature regarding concentrations between 10 and 20 per cent, but the results are not uniform, in part because of neglect of the time element and especially because of failure to distinguish between the effects of sudden exposure to a fixed concentration of the gas and the effects resulting from exposure to a gradually increasing concentration. We have been unable to find any previous description of experiments involving prolonged exposure to carbon dioxide for weeks or months.

In order to establish our own controls and to fill some of these gaps we have accomplished a considerable number of experiments on the rat, rabbit, and dog.<sup>23</sup> In all of these experiments the oxygen content of the inspired air was maintained at 20 per cent or above, unless otherwise stated. Most of these experiments have been done on the rat, since large numbers of animals could be used. In the main, the effects of carbon dioxide on the other animals studied are qualitatively similar, and although all lower animals are somewhat more resistant to carbon dioxide than man, the essential features of action are identical.

Following sudden exposure, the maximal tolerated concentration of carbon dioxide for the albino rat lies between 10 and 20 per cent. All animals survive 10 per cent indefinitely. A few will succumb to 15 per cent, whereas only a few

will survive 20 per cent. None will survive 25 per cent carbon dioxide for more than thirty-six hours, and 50 per cent is uniformly lethal within six hours. Toxic doses are always associated with pulmonary edema. A detectable grade of depression occurs with concentrations of 20 per cent or above, although the animals are not deeply narcotized until 30 per cent concentration is obtained. In the rabbit and in the dog, as in man, narcosis is associated with convulsions.

Rats will survive 10 per cent carbon dioxide for as long as thirty days even if suddenly exposed. During this period the usual respiratory response to carbon dioxide is maintained without diminution as far as can be detected. The only objective sign observed during this time is a weight loss ranging from 15-25 per cent. Animals so exposed behave normally during the exposure and after removal.

Rats will tolerate for long periods concentrations even as high as 23 per cent carbon dioxide if this concentration is attained gradually over a period of several days. Several animals have survived a total of twenty-nine days in concentrations between 20 and 25 per cent. Fifty per cent of the body weight was lost during this period. This is due in large measure to the loss of appe-These animals showed moderate tetany with episodes of mild clonic convulsions for twelve hours after removal but a majority of the animals survived and no permanent effects were noted. It seems clear from these experiments that a certain degree of acclimatization occurs if exposure is gradual, since death occurs invariably within thirty-six hours following sudden exposure to 25 per cent.

A marked shift in the acid-base equilibrium occurs in both acute and prolonged exposure to carbon dioxide. At 11 per cent the pH of serum is approximately 7.1 and this level is maintained throughout a period of at least seventeen days' exposure even though the total carbon dioxide content of arterial blood may increase to a level of 140 volumes per cent during this period, as base is retained in much larger quantities. Although retention of base is undoubtedly one of the factors involved in acclimatization, it does not appear to explain the phenomenon in its entirety, for the amount retained is not adequate to compensate the respiratory acidosis under the conditions of these experiments.

It is of considerable interest to know whether carbon dioxide in subnarcotic concentrations induces any alteration in oxygen consumption since it is generally agreed that anesthesia reduces the consumption of oxygen to a basal level, largely because of the accompanying muscular relaxation. We were surprised to find that the total oxygen consumption of normal rats is re-

# EFFECT OF CARBON DIOXIDE ON NORMAL HUMAN SUBJECTS

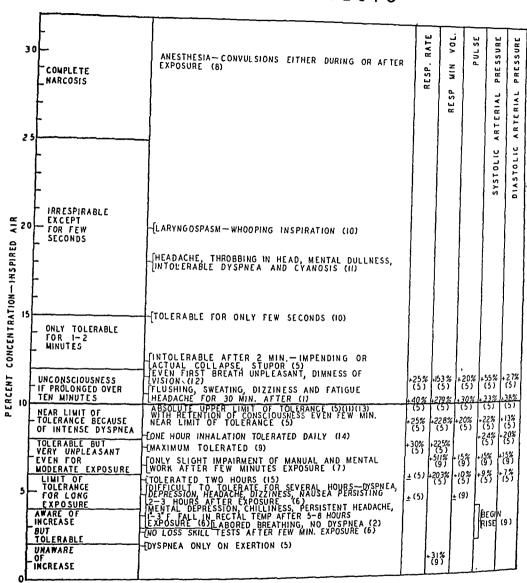

Fig. 1

levels with which one may deal, even inadvertently, during the average anesthesia. As the concentration of carbon dioxide is increased, obviously the most striking sign of narcosis is loss of consciousness. This occurs usually within fifteen minutes when inhaling 10 per cent carbon dioxide. This concentration appears to be a critical level, since further increases result in no further stimulation of respiration, pulse, and

diastolic arterial pressure, although the systolic arterial pressure continues to increase with greater concentrations. These facts support the generally accepted view that concentrations of carbon dioxide above 10 per cent have little place in medicine for their stimulant qualities. Since the evidence is clear-cut concerning a narcotic action of carbon dioxide with concentrations above 10 per cent, the real problem from

marked increase in the duration of pentobarbital anesthesia was noted in animals exposed to 10 and 20 per cent carbon dioxide. With 20 per cent carbon dioxide the duration of anesthesia is nearly doubled.

A 25 per cent prolongation of sleeping time is also observed in rabbits which inspired 20 per cent carbon dioxide after receiving an anesthetic dose of amytal intravenously. Animals which have been acclimatized to carbon dioxide for one week show a similar prolongation of sleeping time with pentobarbital.

Since no resistance is acquired by acclimatization under these circumstances, differing in this respect from that shown with carbon dioxide and cold, it was suggested that carbon dioxide might be acting peripherally to delay the destruction of the barbiturate by the liver rather than to summate with pentobarbital by its narcotic action on the central nervous system. The evidence which has been collected to date seems to support this view and suggests that carbon dioxide acts by diminishing the blood flow through the liver. For example, although sodium nitrite has no effect on the duration of anesthesia with pentobarbital alone, it prevents completely the prolongation of sleeping time induced by carbon dioxide. It is suggested that this action is brought about by overcoming the constriction of the hepatic vessels induced by carbon dioxide, thus increasing the circulation through the liver. Other experiments indicate that the rate of excretion of bromsulfalein is definitely retarded in the rabbit during acute or prolonged exposure to 10 and 15 per cent carbon dioxide, pointing again to a peripheral effect on liver function. If it is assumed that this is the correct interpretation of these results, it seems probable that acclimatization of the vasoconstrictor mechanism to carbon dioxide does not occur, since acclimatization did not modify these results. These experiments need to be repeated both in animals and man, for, if they are confirmed, they may have some appreciable clinical significance, as they could account for some of the unexplained variations noted in the duration of action of the short-acting barbiturates, evipal and pentothal.

Inhalation of carbon dioxide in high concentrations for any length of time is often associated with sequelae which may last for several hours after the event. This is undoubtedly as true in clinical anesthesia as during exposure of the unanesthetized human or animal subject to known concentrations of carbon dioxide. Evidently it takes equally long for the biochemical and . physiologic mechanisms to readjust when the patient returns to breathing air as it did to adjust originally to the high carbon dioxide atmosphere. This means, in effect, that the patient is

probably thrown suddenly into an uncompensated respiratory alkalosis at the termination of anesthesia, especially with the gaseous and volatile agents which allow a rapid recovery of respiratory activity. Such a state occurs because the movement of ions across membranes cannot keep pace with the rate of carbon dioxide diffusion. In animals, following long exposure to carbon dioxide this condition is manifested by tetany and convulsive seizures.

If similar physiologic changes occur in this state, as in ordinary hyperventilation acapnia. then it should also be associated with an arterial hypotension.26 This is possible since a differential in the quantity of cations between blood and tissues should exist even though the blood level of carbon dioxide is not reduced below the normal level. It is the opinion of this author, admittedly without experimental support for this view, that the postoperative "circulatory collapse" commonly seen with cyclopropane, less commonly with other volatile agents such as ether, may be ultimately explained on such a basis.

The clinical significance of some of the experiments which are described here is not clear. It is our opinion, however, that the following factors should be considered seriously by the anesthetist. We are using narcotic concentrations of carbon dioxide regularly during clinical anesthesia. Such concentrations of carbon dioxide may contribute not only to the depth of anesthesia but may possibly delay the detoxication of nonvolatile compounds. Prolonged exposure to such concentrations demands profound. biochemical and physiologic readjustments on the part of the patient. Once these readjustments have been made during anesthesia a certain degree of resistance to further change is acquired. Equally profound adaptations must be made at the termination of anesthesia, and this fact must be recognized as of possible causative significance in any attempt to explain the signs and symptoms of emergence. We should be aware of the facts described here, whether or not we choose to modify our methods of anesthesia so as to eliminate carbon dioxide as a complicating factor.

duced to 75 per cent of the control value with 11 per cent carbon dioxide, even though the increase in muscular activity due to the hyperpnea must be considerable. The maximum reduction occurs about two and a half to five hours after the initial exposure, and if the animal is allowed to remain in the same concentration of carbon dioxide over a period of twenty-four hours the initial level of oxygen consumption is regained.

No reduction in oxygen consumption occurs following prolonged exposure to 10 per cent carbon dioxide but with 15 and 20 per cent the oxygen consumption is reduced to 80 and 71 per cent of normal, respectively.

Although this depressant effect on metabolism with subnarcotic concentrations of carbon dioxide is equal to, or greater than, that which occurs during complete anesthesia with the ordinary agents, it appears to be short-lived and is soon compensated for during acclimatization. From these results it might be expected that the effect of carbon dioxide on oxidative metabolism is exerted more uniformly on all tissues and is less specific in its action than that produced by depressant drugs.

It is clear from these experiments that sudden exposure to carbon dioxide produces much more profound effects than gradual or prolonged exposure and that normal animals tolerate carbon dioxide in reasonably high concentrations for long periods of time. That this might not be true under conditions of stress from other causes is indicated by the following group of experiments. We have previously reported24 that a large incidence of tetanic seizures and convulsions can be produced with 10 per cent carbon dioxide in hyperpyretic etherized rats and have discussed the possible relationship of carbon dioxide and hyperpyrexia to the so-called "ether convulsions" in man. These findings, coupled with observations by Brown<sup>6</sup> that normal subjects exposed to 5 or 6 per cent carbon dioxide for several hours complained of chilliness and had a fall of 1 to 3 degrees F. in rectal temperature, led us to study the effects of carbon dioxide at low environmental temperatures.23 Since even minor grades of depression with other narcotic drugs reduces the ability of an animal or man to adjust to a cold environment this type of an experiment might serve as a means of revealing the amount of depression produced by subnarcotic concentrations of carbon dioxide. It is also possible that carbon dioxide very specifically depresses the heat regulatory centers.

Results obtained with carbon dioxide and cold were striking. A reversible state of narcosis having certain features of hibernation and anesthesia may be induced and maintained for many hours in the rat or dog by sudden exposure at 5 C. to concentrations of carbon dioxide of 5 per cent or greater. This state is reached after several hours of exposure and is accompanied by a marked fall in body temperature, loss of reflexes, bradycardia, and bradypnea. A somewhat similar state can be induced by exposure to low concentration of oxygen (10 per cent) or high concentration of oxygen (4 atmospheres) at low environmental temperatures, indicating the possible relationship of the phenomenon to a reduction of oxidations in the body.

Previous fasting, previous exposure to 10 per cent oxygen for three weeks, or small doses of depressant drugs render an animal much more susceptible to narcosis under these conditions. Animals which have been previously exposed to cold or to carbon dioxide for several days, or have been fed thyroid in large doses or narcotized several times by the method indicated, become completely resistant to narcosis induced by carbon dioxide and cold. Evidently the critical factor involved is the existing level of metabolism. If the level of metabolism is raised sufficiently, heat production can exceed heat loss. This fact suggests that the narcotic action of carbon dioxide is diffuse rather than being exerted specifically on the heat regulatory centers. Experiments of this type appear to indicate that all concentrations of carbon dioxide above 5 per cent possess some depressant qualities, even though such effects may not be readily detected by ordinary means.

It is of considerable interest in relation to the experiments just discussed that similar studies in man involving carbon dioxide and cold have been undertaken by Case and Haldane<sup>7</sup> for the British Admiralty, in view of conditions which might exist in submarines. Unfortunately, these experiments were of too short duration to determine whether a similar state of narcosis can be induced in man with carbon dioxide and cold. It may be mentioned in passing that their experiments proved that high pressures exaggerate the narcotic action of carbon dioxide, for they have shown that concentrations of this gas of 0.66 per cent at 10 atmospheres (equivalent to a partial pressure of 6.6 per cent at 1 atmosphere) produced unconsciousness in one to five minutes.

One of the questions of interest to the anesthetist concerns the summative narcotic action of carbon dioxide with other anesthetic agents. The evidence is reasonably clear that such summation occurs with volatile agents<sup>25</sup> even with 5 and 10 per cent carbon dioxide. We have undertaken some experiments to determine the effects of carbon dioxide on the toxicity and duration of action of pentobarbital anesthesia in rats. Neither 5, 10, nor 20 per cent carbon dioxide has any significant effect on the toxicity of pentobarbital as indicated by ultimate recovery but a

marked increase in the duration of pentobarbital anesthesia was noted in animals exposed to 10 and 20 per cent carbon dioxide. With 20 per cent carbon dioxide the duration of anesthesia is nearly doubled.

A 25 per cent prolongation of sleeping time is also observed in rabbits which inspired 20 per cent carbon dioxide after receiving an anesthetic dose of amytal intravenously. Animals which have been acclimatized to carbon dioxide for one week show a similar prolongation of sleeping time with pentobarbital.

Since no resistance is acquired by acclimatization under these circumstances, differing in this respect from that shown with carbon dioxide and cold, it was suggested that carbon dioxide might be acting peripherally to delay the destruction of the barbiturate by the liver rather than to summate with pentobarbital by its narcotic action on the central nervous system. The evidence which has been collected to date seems to support this view and suggests that carbon dioxide acts by diminishing the blood flow through the liver. For example, although sodium nitrite has no effect on the duration of anesthesia with pentobarbital alone, it prevents completely the prolongation of sleeping time induced by carbon dioxide. It is suggested that this action is brought about by overcoming the constriction of the hepatic vessels induced by carbon dioxide, thus increasing the circulation through the liver. Other experiments indicate that the rate of excretion of bromsulfalein is definitely retarded in the rabbit during acute or prolonged exposure to 10 and 15 per cent carbon dioxide, pointing again to a peripheral effect on liver function. If it is assumed that this is the correct interpretation of these results, it seems probable that acclimatization of the vasoconstrictor mechanism to carbon dioxide does not occur, since acclimatization did not modify these results. These experiments need to be repeated both in animals and man, for, if they are confirmed, they may have some appreciable clinical significance, as they could account for some of the unexplained variations noted in the duration of action of the short-acting barbiturates, evipal and pentothal.

Inhalation of carbon dioxide in high concentrations for any length of time is often associated with sequelae which may last for several hours after the event. This is undoubtedly as true in clinical anesthesia as during exposure of the unanesthetized human or animal subject to known concentrations of carbon dioxide. it takes equally long for the biochemical and physiologic mechanisms to readjust when the patient returns to breathing air as it did to adjust originally to the high carbon dioxide atmosphere. #### SIX PLANTATIONS TO INCREASE QUININE OUTPUT IN GUATEMALA

Six large plantations in Guatemala now are pushing a program for production of more cinchona bark, needed for quinine to battle malaria among troops fighting in the tropics.

The quinine is obtained from the bark of grown or partly grown cinchona trees. One of the plantations growing these trees is famous El Porvenir, owned by the government of Guatemala, and operated by the United States Foreign Economic Administration under a concession. It is the largest cinchona plantation in the Western Hemisphere.

Private planters are carrying on the work at other

plantations,

Two have contracted to grow 8,000,000 seedlings each.

El Porvenir is more than 60 years old. Some of the other plantations had begun experiments with cinchona as early as 1934. This was seven years befor Pearl Harbor and subsequent events which interrupted the main quinine supply from the Netherlands East Indies at a time when it was needed most.

Today these five plantations are growing increasing quantities of cinchona. The five are known as Finca Helvetia, Finca Panama, Finca Moca, Finca El Zapote, and Finca El Naranjo.

El Porvenir is on the slopes of the extinct volcano, Tajumulco, Guatemala's highest mountain.

plantation was started in 1880, but later encountered competition from the Netherlands East Indies.

El Porvenir has more harvestable cinchona trees than all the other Guatemala plantations put together. But surveys indicate that potentially the others have more trees than El Porvenir. One of the largest plantations is on Fuego Volcano.

Guatemala is in quite a different situation from some of the other American countries with respect to The tree is believed not to be native there. And yet some of the most effective work in development of plantation cinchona in this hemisphere has been done there. On the other hand, the tree is native to Peru, Colombia, Ecuador, and Bo-livia. Much wild cinchona bark is being gathered from these countries. Some of them also are developing plantations.

In line with the inter-American program of cooperation in development of hemisphere resources, specialists from the Foreign Economic Administration are aiding these countries in their cinchons programs. Among the specialists is Keith Cone, chief of the Cinchona Section of the Foreign Economic Administration, who has looked over cinchons operations in much of South and Central America. Release from the Office of the Coordinator of Inter-

American Affairs

#### 1944 EXAMS BY AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY

The general oral and pathology examinations (Part II) for all candidates will be conducted at Pittsburgh, Pennsylvania, by the entire Board from Wednesday, June 7, through Tuesday, June 13, 1944. The Hotel William Penn in Pittsburgh will be the headquarters for the Board. Formal notice of the exact time of each candidate's examination will be sent him several weeks in advance of the examination dates. Hotel reservations may be made by writing to the hotel.

Candidates for re-examination in Part II must make written application to the Secretary's Office

not later than April 15, 1944.

The Pittsburgh Obstetrical and Gynecological Society will hold an informal subscription dinner meeting at the Hotel William Penn on Saturday evening, June 10, 1944, at 7:00 P.M. Visitors, there for the examinations, are cordially invited to make arrangements to attend. Reservations may be made by writing to Dr. Joseph A. Hepp, Secre-

tary, at 121 University Place, Pittsburgh 13, Pennsylvania. An interesting program is being provided.
The Office of the Surgeon General (U.S. Army)

has issued instructions that men in service eligible for Board examinations be encouraged to apply and that they may request orders to Detached Duty for the purpose of taking these examinations whenever possible.

Candidates in military or naval service are requested to keep the Secretary's Office informed of

any change in address.

Deferment without time penalty under a waiver of our published regulations applying to civilian candidates, will be granted if a candidate in service finds it impossible to proceed with the examinations

of the Board. Applications are now being received for the 1945 examinations. For further information and application blanks, address Dr. Paul Titus, Secretary, 1015 Highland Building, Pittsburgh 6, Pennsylvania.

#### PROGRESS IN THE STUDY OF EXPERIMENTAL ENDOCARDITIS

WARD J. MACNEAL, M.D., MARTHA JANE SPENCE, M.A., and ANNE BLEVINS, R.N., New York City

BY THE relatively simple procedure of re-peated intravenous injection of large amounts of culture of Streptococcus viridans, and without other injury to the valves, it has been possible to cause endocardial vegetations in various small animals such as rabbits, rats, and mice. Rabbits, because of their conveniently large ear veins, have been used for the most part. Photographs of the gross lesions and of microscopic sections have shown the essential resemblance of the vegetations to those of the human disease.1 The experimental disease obviously offers an exceptional opportunity for study of the sequence of events in the development of the characteristic lesions.

Among the early changes<sup>2</sup> following intravenous injection of the streptococci is the widespread, practically general, phagocytosis of these bacteria, in part by the wandering white cells of the blood, but especially by the vascular endothelium throughout the body. The phagocytosis by endothelium may be readily seen in the liver, spleen, pulmonary capillaries and arterioles, small vessels of the myocardium, and, of particular interest for the present discussion, in the endothelial lining of the chambers of the heart and of the valve leaflets. In a favorable section of the heart, phagocytosed cocci may be found in the endocardium of every microscopic field of the oil immersion objective. In most of the endocardium this phenomenon of phagocytosis obviously results in destruction of the microbes without serious or even recognizable persistent change in the endocardium. In some places, however, the endothelial phagocytic cells become swollen and may even disintegrate, and here their injury sometimes initiates a local thrombosis. This serious alteration occurs more readily at those places where the swollen endothelial cells are subjected to the further insult of physical contact and strong pressure against their fellows along the lines of contact of the valve leaflets during closure—namely, on the auricular surfaces of the mitral leaflets and the ventricular surfaces of the aortic leaflets near their free margins. Once the process of local thrombosis has been started, the bacteria caught in the meshes of the clot find particularly favorable conditions for survival and multiplication, and by their massive growth produce enough toxic substances to keep phagocytic cells at a distance and to induce further progressive deposition of fibrin. The subjacent living substance of the valve leaflet becomes enormously swollen by edema, by infiltration with wandering cells, and eventually by proliferation of endothelial and fibroblastic elements.

In the ascending aorta, phagocytosis of the cocci by the endothelium is followed, in some locations, by abundant proliferation of the bacteria to form mycotic plaques, beneath which there is shallow necrosis of the aortic wall with more extensive edema beyond it. Lesions of this type evidently tend to heal, leaving intimal scars in the aortic arch.

The rabbits examined in the early stages of the disease following intravenous inoculation show also interesting lesions in the endocardium of the right ventricle of the heart, in and on the papillary muscles and tendinous cords of both ventricles, in the coronary branches, and in the myocardial capillaries, and also in the muscle. These changes can receive only passing mention at this time. It is also necessary to neglect at this time the later changes seen in other organs and tissues outside the heart in order to consider the further progress of the endocardial lesions on the mitral and the aortic valves, lesions which tend to develop in a progressive manner to bring about the eventual death of the experimental animal

After the injury to the valve has induced the deposition of fibrin on its surface, the bacteria growing in this clot present variable relationships. In some vegetations there are large bacterial colonies distributed throughout the cell-free fibrin and extending to the free surfaces of the clot, in actual contact with the circulating blood. Here it seems that the blood plasma has offered little, if any, opposition to the bacteria, permitting them to multiply on the exposed surface of the vegetation and to escape continually from this surface into the general circulation. In other vegetations, however, one finds evidence of more antagonism. Sometimes the colonies of streptococci are found only in the deep layers of fibrin, and the superficial layer of the vegetation consists of fibrin quite free from visible bacteria. In these lesions

Read at the Annual Meeting of the Medical Society of the

State of New York, Buffalo, May 4, 1943.
From the Department of Bacteriology, New York Post-Graduate Medical School and Hospital, Columbia Univer-

Aided in part by a grant from the Committee on Thera-peutic Research of the Council on Pharmacy and Chemistry, American Medical Association, and by a grant from the United Hospital Fund, New York City,

something evidently operates to prevent the growth of the streptococci in the more superficial parts of the vegetation, and this something is evidently carried in the blood plasma which bathes the vegetation. In such a vegetation the deeply buried bacterial colonies no longer shed the streptococci into the blood stream. This picture would therefore seem to represent a step in the direction of healing.

In some vegetations the deep bacterial colonies undergo a curious degeneration, so that the individual cocci stain poorly or not at all. Many of them appear to have been devitalized. In the poorly staining bacterial masses there may remain a few well-stained cocci, or one may recognize well-stained actively growing colonies in the fibrin at a short distance from the dying bacterial masses. The explanation of this behavior is not understood. Occasionally one sees a bacterial colony with disintegrated center and a surrounding cortex of well-stained, actively growing bacteria, and in some instances the vegetation presents a curious lamination with successive layers of fibrin, one layer containing abundant colonies and another relatively free from bacteria. This appearance suggests that the bacterial proliferation is at times seriously inhibited and that bacterial destruction is accomplished by the action of something in the blood plasma in conjunction with products of the bacteria themselves, bringing about an actual lysis of the streptococci.

Other changes which indicate local healing include actual tissue repair. The superficial bacteria-free layer of fibrin provides a framework over which the multiplying endothelial cells spread to form a smooth covering while endothelial cells and fibroblasts grow into the fibrin and even approach the disintegrating bacterial colonies in the underlying layers. Eventually the incarcerated bacterial colonies may be invaded and destroyed by phagocytic cells and the vegetation finally replaced by fibrous scar. The conditions which bring about such healing are not clearly understood and cannot be controlled at the present time. Possibly some of the various therapeutic agents may play a part in the favorable outcome, but this is still rather uncertain.

Among control animals given repeated intravenous inoculations without other treatment, there are some which are entirely free from visible endocardial vegetations even after many weeks. Why these few animals resist the infection we do not know. On the other hand, some rabbits succumb very quickly, even within a week. These are usually less vigorous individuals.

The technical methods for recognition of

vegetations on the cardiac valves of the living rabbit3 leave something to be desired. Progressive loss of weight, persistent muscular weakness, and persistently positive blood culture, for more than a week after inoculations have been discontinued, are strong evidence favoring a diagnosis of bacterial lesions on the valves. Auscultation of the heart while its rate is care-· fully altered by pressure on the neck of the rabbit sometimes permits the recognition of changes in the heart sounds which indicate defects of the valves, and one may even diagnose mitral stenosis and regurgitation in this way. Very rarely, one may detect by palpation an abnormally resistant mass in the region of the heart, which is found at necropsy to be a very large endocardial vegetation. These physical signs ordinarily become clearly evident only a few days before death of the animal. They sometimes permit a fairly confident prediction of the necropsy findings.

The streptococci found in blood cultures in human endocarditis are variable in nature. One may easily recognize three groups, the salivarius type, the anhemolytic (saprophyticus) type, and the enterococcus type, but in addition there are commonly found atypical strains that are difficult to classify. In their behavior toward therapeutic agents these various culture strains are far from uniform. Some of the enterococcus strains are susceptible to lysis by bacteriophages in the test tube. So far we have not been able to obtain effective bacteriophages for the salivarius strains. The streptococci are also remarkably variable in their susceptibility to chemical agents in the culture medium and it is recommended that therapeutic agents be tested against the cultures in order to select those which may appear most promising for use in therapy.

Our experimental therapy of the disease in rabbits has been discouraging. Preliminary bacterial vaccination has afforded no protection against endocarditis. Prophylactic and therapeutic use of strong agglutinating rabbit serum has seemed to hasten the development of large vegetations in the inoculated animals. Large doses of sulfonamides have been equally disappointing. On the other hand, there have been some indications of a favorable influence upon the experimental disease in a few instances, but the studies are still in an uncertain preliminary stage and may merely serve to encourage false hopes.

The study of experimental endocarditis offers an opportunity for progress toward a better understanding of the nature of the human disease. The struggle toward eventual prevention and successful therapy promises to be laborious and slow and may even prove to be entirely futile.

Nevertheless, the opportunity to engage in such studies should not be neglected.\*

\*Since the presentation of this paper in May, 1943, further studies, by MacNeal, Blevins, Poindexter, and Slavkin have shown that the streptococci of the enterococcus types, susceptible to lysis by bacteriophages, are ordinarily resistant to penicillin, while the salivarius strains, which are resistant to bacteriophages, are usually very suspectible to the bacteriostatic action of penicillin. In experimental rabbits infected with the enterococcus strains and treated with intravenous injections of bacteriophage, local arrest and healing of the lesions and, in some instances, complete recovery of the rabbits have been observed. Similarly, in animals infected with the salivarius type of

streptococcus, arrest and healing and even complete recovery of the rabbit have followed the use of penicillin. In human patients with endocarditis due to the salivarius type of Str viridans satisfactory arrest of the disease has been observed following the use of penicillin in conjunction with other commonly used therapeutic and supportive measures.

#### MARIHUANA

In recent years there have been many newspaper accounts of the great danger threatening America from marihuana (hemp) addiction. One brutal murder by two young women was said to be the result of their smoking of marihuana. Other lurid accounts have told of the prostitution of school children through selling them marihuana cigarettes. Now it seems that such tales have had no basis in fact. An editorial in The Military Surgeon entitled "The Marihuana Bugaboo" contains the following statement:

"It is the writer's considered opinion that the smoking of the leaves, flowers, and seeds of Cannabis salira is no more harmful than the smoking of tobacco, or mullein, or sumac leaves, or any of the other plants that have been used for the purpose. There appears to be the occasional individual who, having smoked this plant, prefers its mild exhilara-tion to that of tobacco, but they are most exceptional. Ordinarily, after the first curiosity is satisfied, tobacco is much preferred.

"It is further considered that the legislation in relation to maribuana was ill-advised, that it branded as a menace and a crime a matter of trivial importance. It is understood that this legislation is, furthermore, a serious detriment to the development of a hemp fibre industry in this country. Finally, it is hoped that no witch hunt will be instituted in the military services over a problem that does not ex-

"Probably most physicians will be as surprised as the writer that America faces no menace from marihuana. It is a great source of gratification that this is so and that there is no danger of the wrecking of children's lives through a too lively curiosity in the smoking of hemp."—F. C. S.—Editorial, Phila. Med., January 8, 1944.

We, too, share the relief expressed in Editor Smith's last paragraph if the editor of The Military Surgeon is right, for within recent memory there was some alarm in Wilmington over the alleged peddling of "reefers," or "mary janes," to the pupils of our senior and junior high schools.

However, it is neither wise nor scientific to go all out for a new thesis, unless it be most thoroughly documented. We still retain the fear that some of the many medicolegal cases charged up to marihuana were bona fide. Davidson (Synopsis of Materia Medica, Toxicology and Pharmacology, Second Edi-tion, 1942, page 260) states, "It is important to recognize that both the prolonged use by habitués, and the single large dose taken by a novice may cause criminal, maniacal acts. Moreover, even small quantities can destroy the will power and the ability to connect and control thoughts and actions, thus releasing all vicious inhibitions." So, till the article in The Military Surgeon can find corroboration, it may be well to assume that the final word on this subject has not yet been said.—Editorial in the Delaware State M.J.

#### COMMITTEE ON ALCOHOLISM ESTABLISHED BY RESEARCH COUNCIL

The appointment of a new committee on alcoholism by the Research Council on Problems of Alcohol is on the Research Council on Problems of Alcoholis one of the results of the recent reorganization of the group. Members of the committee are Drs. Lawrence S. Kubie and Thomas A. C. Rennie, New York; Mesrop A. Tarumianz, Farnhurst, Delaware; Edward H. L. Corwin, Ph.D., New York; Leonard V. Harrison, LL.D., New York; Francis T. Chambers, Jr., Philadelphia; Anna Kempshall, New York; Hunter Miller, Richmond; Herbert Taylor and William Wilson, New York. Under the reorganization the research council aimed to increase reorganization the research council aimed to increase its representatives on its board of directors on a re-gional basis. Thus far some members have been named for the eastern district, Canada, southern

district, north central district, and the Pacific Coast district; however, these appointments are not complete. Another new feature is the appointment of an executive committee of the board of directors to give special attention to the business and financial affairs of the council. An executive committee of seven members of the scientific committee has been appointed to give closer attention to rehas been appointed to give closer attention to research on the treatment of alcoholism: Dr. Karl M. Bowman, San Francisco; Dr. Frank J. Curran, New York; Lawrence K. Frank, Brooklyn; Dr. Harold E. Himwich, Albany; Elvin M. Jellinek, Sc.D., New Haven, Connecticut; and Thorsten Sellin, Ph.D., Philadelphia.—J.A.M.A., Feb. 19.

#### FAT AND VITAMIN A ABSORPTION IN SPRUE

DAVID ADLERSBERG, M.D., New York City

THE sprue syndrome is characterized by the I following features:

Impairment of intestinal fat absorption. The bulky feces are loaded with split fat in the form of globules and needle-shaped crystals of fatty soaps and fatty acids in the absence of an excess of neutral fat and striated muscle fibers.

Restoration of normal fat absorption and disappearance of the excess of split fat from the stools by specific "sprue therapy."\*

3. Absence of gross pathologic changes in the intestinal tract if postmortem changes have been prevented, thus suggesting a disturbed

function of the intestinal wall to be the underlying cause.

These characteristics differentiate the sprue syndrome from other pathologic conditions which may resemble sprue—e.g., steatorrhea in diseases of the pancreas. Owing to the absence of enzymes in pancreatic steatorrhea the fat is not split, large amounts of neutral fat and striated muscle fibers are found in the stools, and specific treatment, effective in sprue, fails to restore normal fat absorption. It is our belief that the term "sprue syndrome" is the best designation for undetermined impairment of fat absorption as it is found in tropical and nontropical sprue and in celiac diseases. It is broader than Thaysen's1 term "idiopathic steatorrhea," which stresses only one feature of the disease—the loss of fats in the feces. Cases of steatorrhea of a known origin-due, for instance, to pancreatic disease, lymphosarcoma of the small intestine, tuberculosis of the mesenteric glands, etc.—should be strictly separated from the "idiopathic steatorrhea" of the sprue syndrome.

The other symptoms of sprue are less typical. Hypocalcemia, tetany, decalcification of bones and osteoporosis, retardation of growth, anemia, hypoproteinemia, stomatitis, and glossitis, radiographic changes of the small intestine, and the various vitamin deficiencies may be present. Typical cases of sprue occur without one or more of these conditions, which are only secondary in nature and are caused by the impaired intestinal absorption. Thus, the hypocalcemia is the result of calcium losses caused by the combination of calcium with the unabsorbed

fatty soaps; the deficiency of fat-soluble vitamins is directly associated with the abnormal fat absorption.

The mechanism and nature of the impaired fat absorption in sprue is still unknown, although there are indications that tropical as well as nontropical sprue and celiac disease are caused by the deficiency of some essential dietary factor or factors. May et al.2 concluded on the basis of very careful studies performed in cases of celiac disease that the defect of absorption is located directly in the intestinal mucosa, since other essential factors like motility, emulsification, etc., were corrected and caused no improvement of absorption. Hurst<sup>3</sup> suggested that characteristic features of the sprue syndrome are the result of paralysis of the muscularis mucosae, which would lead to the loss of the pumping action of the villi, by means of which fat is conveyed from lacteal radicles of the villi into larger lacteals. Paralysis of the muscularis mucosae may be secondary to the loss of the normal stimulant of Meissner's plexus or to the effect of vitamin deficiency or some toxemia of the plexus. One must realize that our knowledge of the normal, and particularly of the abnormal, intestinal absorption is very limited. Despite the work of Verzar' and others, many aspects of the chemical and neuromuscular controls are obscure, as are the pathologic changes of the plexus of Meissner.5

In typical cases of sprue the clinical picture, the usual laboratory findings (blood picture, stool analysis), the radioscopic and radiographic examination of the small intestine, lead to a correct diagnosis. In milder and borderline cases the differentiation between sprue and inflammatory disease of the small intestine (jejuno-ileitis) may be difficult both clinically and radiographically.6 In the latter disease diarrhea and anemia are found and the feces may contain excessive fatty soaps and acids, possibly as a result of increased motility.7 In these cases the clinician is looking for a "function test" of intestinal absorption.

For the past few years the flat blood-sugar curve after the ingestion of glucose has been considered a valuable aid in the diagnosis of the sprue syndrome. Despite its practical value two objections can be raised against it:

1. The character of the blood-sugar curve depends to a great extent on the diet of the individual; high fat, low carbohydrate diet raises, and low fat, high carbohydrate diet

irreversible and refractory to treatment (Hanes18).

Read at the Annual Meeting of the Medical Society of the State of New York, Buffalo, May 4, 1943.

From the Medical Services, Nutrition Clinic, and Department of Chemistry of the Laboratories, Mount Sinai Hospital

\* There are rare instances in which the morbid process is

flattens the curve. A patient with steatorrhea is comparable with a normal subject taking a low fat, high carbohydrate diet (Hurst<sup>2</sup>).

2. The flat blood-sugar curve does not gage the essential disturbance of sprue, which certainly is the impaired absorption of fat and fat-soluble vitamins.

It was for these reasons that for clinical studies in sprue the fat tolerance test and the vitamin A tolerance test were adopted, the latter as a representative of the fat-soluble vitamins. As has been described previously, 2, these two tests represent a practical method for study of the intestinal absorption for clinical purposes.

#### Method

Fat Tolerance Test.—As a standard procedure the fat tolerance test recommended by Nissen<sup>10</sup> and modified by Kann and Sobotka<sup>11</sup> was adopted. The test determines the total serum lipids at various intervals before and after ingestion of 1 Gm. of butter fat (given as heavy cream) per Kg. of body weight. The maximum rise of the total lipids in the blood occurs in the fourth or fifth hour after ingestion, depending on the position and activity of the subject; under conditions of bed rest the maximum elevation is found in the fourth hour. We were able to corroborate these findings. The procedure is as follows:

- 1. Take a fasting blood specimen (10-15 cc.).
- 2. Give a fat tolerance test meal: one cup of tea, one slice of white bread, and 1.2 cc. of heavy cream (40 per cent fat content) per pound of body weight.
- 3. Take blood specimen four hours after test meal.
  - 4. Determine total lipids in serum.

Vitomin A Tolerance Test.—This test consists of the determination of the Vitamin A content of the serum of the fasting individual, and also four hours after the ingestion of a test dose of vitamin A. Various amounts (1.5-15 cc.) of percomorph oil (1 cc. = 60,000 I.U. of vitamin A) were used for this purpose, but most tests were done with 3 cc. of percomorph oil (180,000 I.U. of vitamin A). The procedure is as follows:

- 1. Draw fasting blood specimen (20 to 25 cc.).
- 2. Give vitamin A tolerance test meal: one cup of tea, one slice of white bread, and 1.5 to 15 cc. of percomorph oil.
- 3. Draw blood specimen four hours after test meal.
- 4. Determine vitamin A and carotene content of serum (Carr-Price reaction, using the photoelectric colorimeter) by the method of Dann and Evelyn.1:

#### Fat Tolerance Test and Vitamin A Tolerance Test in Sprue

The results of the fat tolerance test in controls, typical cases of sprue in the active stage, and typical cases of sprue during remission, are presented in Table 1. The controls were patients convalescing from various diseases, who had been afebrile for at least seven to ten days prior to the performance of the test. For the second group 5 typical sprue patients with marked steatorrhea, macrocytic anemia, hypocalcemia, etc., were selected. The third group also comprises 3 typical sprue patients who showed marked improvement after a prolonged period of specific treatment (diet, injections of large doses of liver extract, and vitamins) and were in remission at the time of examination.

The control group shows an increase of the total lipids of the serum of 59 per cent four hours after the fat tolerance meal. In the group of active sprue cases the total lipids of the serum remain practically unchanged four hours after the fat tolerance meal, the average being only 3 per cent. These results illustrate the inability of active sprue patients to absorb fat. In the group of inactive sprue cases the increase in the percentage of the total lipids of the serum is 53 per cent, after the same time of four hours.

During a remission in sprue the fat absorption is fairly normal.

The results of the vitamin A tolerance test in 9 control cases and 2 cases of active sprue are

summarized in Table 2. Ingestion of 600,000 I.U. of vitamin A in controls raises the vitamin A level in the serum by approximately 300 per cent, in four hours. In most of the tests smaller amounts (90,000-180,000 I.U.) were used and the average increase of the vitamin A content of the serum is 41 per cent after four hours. The carotene content of the serum remains unchanged. In contrast to the behavior of the controls, the 2 sprue cases present no elevation of the vitamin A content after ingestion of 90,000 I.U. of vitamin A. The vitamin A tolerance test would prove the failure of absorption of vitamin A in active sprue, if confirmed in more cases, paralleling the inability to absorb fat in the fat tolerance test.\*

#### Fat Tolerance Test and Vitamin A Tolerance Test in Jejuno-Ileitis

Five cases of extensive jejuno-ileitis were studied. Most of them had been chronic cases of diarrhea for several years, and none for less than a few months. The accompanying anemia was microcytic. Radioscopic and radiographic examination revealed extensive involvement, rigidity, and narrowing ("string symptom") of wide areas of the small intestine. There is a 65 per cent increase of the total lipids of the serum four hours after the fat tolerance meal (see Table 3). The severest case of the group is No. 112 but even in this case a moderate fat absorption takes place, with elevation of the total lipids of the serum from 499 to 602 mg. per cent—i.e., 20 per cent.

The administration of 90,000-180,000 I.U.

TABLE 3 .- FAT TOLERANCE TEST IN JEJUNO-ILEITIS

	Total Lipids (Mg. Per	in Serum Cent)

148	259	357	38
Mean	377 (±47)	623 (±100)	65

of vitamin A raises the vitamin A level of the serum in these cases from an average of 63 I.U. per cent to 94 I.U. per cent four hours after the vitamin A test meal, the increase being 52 per cent (see Table 4). Increasing the dose to 600,000 I.U. raises the vitamin A content of the serum in these cases to about 200 per cent.

Thus the results of the vitamin A tolerance test again parallel those of the fat tolerance test. Even in extensive jejuno-ileitis, absorption of fat and vitamin A may be satisfactory, in sharp contrast to active sprue.

#### Effect of Lecithin on Fat and Vitamin A Tolerance Tests

The studies of lipotropic substances resulted in better understanding of the role of choline and lecithin in the diet. Choline is considered a member of the vitamin B complex, dand lecithin as a source of choline may contribute an essential dietary factor. The lipotropic effects of lecithin and its emulsifying capacity suggested a study of its effects upon the intestinal absorption of fat and vitamin A in normal individuals and in cases of sprue.

A palatable form had to be found in which lecithin could be administered to healthy individuals and to patients. Various purified lecithin products were tried out in combination with alcohol, nuts, figs, preserves and cream cheese, in chocolate-covered candies and pastries, and also as milk and chocolate shakes. With all these ingredients only small amounts of pure lecithin could be effectively camouflaged (1 to 5 Gm.);

when larger amounts (10 to 20 Gm.) were given the disagreeable taste could not be overcome. This resulted in gastric discomfort, epigastric pressure, nausea, and occasional vomiting. Better results were obtained with commercial lecithin, a mixture of soybean phosphatides containing approximately 20 per cent of lecithin. This substance mixed with preserves or fruit jellies, or incorporated in milk shakes, was very well tolerated by normal subjects and by most patients. A convenient form is a spread to be used on crackers or cookies. Thus, amounts up to 10-20 Gm. of commercial lecithin could be easily administered in a single dose, to make daily totals of 30-70 Gm. The innocuousness of comparatively large amounts of commercial lecithin was proved in these studies.8 Even with maximal doses of pure and commercial preparations, only a moderate elevation of the serum phosphorus was occasionally observed, associated with a moderate diminution of calcium, without any striking alteration of the phosphoruscalcium ratio. In a few instances of hypercholesterolemia a striking decrease of the serum cholesterol was observed after prolonged lecithin administration.17

The effect of 10 to 15 Gm. of commercial lecithin on the fat tolerance test is presented in Table 5. The average elevation of the total lipids in serum rises in the five controls from 32 to 71 per cent, and in three cases of active sprue from 2 to 27 per cent, thus indicating increased fat absorption. Blank experiments with 10 Gm. of lecithin but without the cream meal showed practically no increase of the blood lipids.

The results of the vitamin A tolerance tests parallel those of the fat tolerance test. Two tests were performed in these cases within an interval of a few days, one test being made without lecithin and one with the addition of 9-12 Gm. of commercial lecithin. In the tests with lecithin the elevation is markedly en-

hanced, the average elevation of the vitamin A level in the blood rising from 41 per cent when lecithin was not given, to 212 per cent when it was added. The data on this series will be presented in another paper, and therefore are not repeated here. Control tests performed with defatted commercial lecithin proved that the increases observed with commercial lecithin cannot be attributed to its content of soya oil. However, the question of whether the observed effects on intestinal absorption are caused exclusively by its lecithin content is unanswered, and the effects of cephalin and inositol have to be studied. The mobilization of fat and vitamin A in the depots (liver) by the lipotropic action of lecithin is probably of lesser importance.

These observations suggested the addition of lecithin to the dietary regimen of sprue and sprue-like conditions. 62,6 Amounts of 5-20 Gm. of commercial lecithin daily have been used. In a group of cases a favorable influence on the frequency and consistency of the stools was observed with markedly diminished elimination of fatty soaps and fatty acids as seen on microscopic examination of the feces. Larger amounts, over 15 Gm., were not well tolerated, possibly because of the effect of the soy bean oil upon intestinal motility. Under no circumstances is the feeding of lecithin apt to replace the usual sprue therapy, which consists of a high protein, low fat diet and large amounts of parenteral liver extract and vitamins; however, it may supplement this therapy. The effect of small and large amounts of lecithin on the fat content of the stools in normal subjects and in cases of disturbed fat absorption, by chemical analysis, remains to be studied.

#### Summary

The fat tolerance test and the vitamin A

<sup>\*</sup>The approximate composition is: lecithin 20 per cent. cephalin 20 per cent, oil 30 per cent, carbohydrates 10 per cent, inositol and allied compounds 15 per cent, phytosterois 2 per cent.

tolerance test are clinical "function tests" of the absorptive capacity of the intestinal tract for fat and the fat-soluble vitamin A. Active sprue is characterized by a failure of absorption which manifests itself in complete lack of elevation of the lipids or of the vitamin A content of the serum, after the ingestion of a standard dose of butter fat or vitamin A, respectively. During a remission, satisfactory fat and vitamin A absorption are found.

In contrast to sprue, cases of extensive granulomatous jejuno-ileitis show a considerable fat and vitamin A absorption in the tests. Apparently, in jejuno-ileitis small areas of normal intestinal wall and possibly even the diseased areas are able to absorb fat and vitamin A, whereas in sprue there is a puzzling generalized inhibition of absorption in each individual cell of the intestine.

Addition of lecithin enhances the elevation of the total lipids of the serum in the fat tolerance test, and of the vitamin A content of the serum in the vitamin A tolerance test. This effect is due to increased intestinal absorption and, probably to a lesser extent, to mobilization of deposits in the liver.

The use of moderate amounts of lecithin in the diet of the sprue syndrome (tropical and nontropical sprue, celiac disease) is suggestive.

#### Discussion

Henry A. Rafsky, M.D., New York City-Dr. Adlersberg's paper is of especial interest to me. The role which intestinal absorption plays in nutritional problems has been recognized. has also been known that an impaired intestinal mucosa can produce an avitaminosis even though the patient has been on an adequate vitamin diet. It does not make much difference whether the mucosa of the small intestine is affected by a pathologic process or whether a change takes place in the mucous membrane as the result of a physiclogic atrophy as is witnessed in the aged. Dr. Newman and I have been studying the question of saturation of vitamins in the aged at the Hospital and Home of the Daughters of Jacob. We have found that some of these individuals who were observed needed as much as 900 mg. of vitamin C and others 90 mg. of thiamine chloride before they reached saturation. In other words, due to the physiologic atrophy of the intestinal mucosa in the aged there is a diminution of intestinal absorption and the results are similar to what Dr. Adlersberg found with vitamin A in his cases of sprue. In regard to the difference in the findings in cases of ileitis and sprue, here again the problem resolves itself as to whether the lesion is confined to the mucosa and how much of the affection involves the other coats of the small intestines. In sprue evidently the lesion is confined mainly to the mucosa. In ileitis, while the mucous membrane is involved, the other coats of the small intestines are likewise affected. In fact, the involvement of the latter with the resultant cicatricial contraction and narrowing of the lumen produces the x-ray evidence of this disease, as well as the palpable mass. Clinically, however, for reasons which cannot be gone into at the present time, it must be borne in mind that an adequate supply of vitamins and minerals is also essential in treating cases of ileitis.

#### OLD FRIEND

An Army prospect taking his physical examination was asked by the doctor if he could read the fourth line on the eye chart. "Read it?" exclaimed the prospect. "Why, I know the guy personally. He played right guard for Fordham last fall."—Rotary Hub

#### SURGICAL ASPECTS OF GASTRIC ULCER

JOHN D. STEWART, M.D., and FLOYD M. ZARDFEL, M.D., Buffalo

THE subject of gastric ulcer is not so re-I mote as one might suppose from the problems of war medicine that are uppermost in the minds of most of us today. Evidence has recently been summarized which shows a sharp increase in peptic ulcer since the start of the war, both here and in European countries.1 The increase is demonstrable in both the military and civilian populations and appears to be greater than can be attributed solely to improvements in diagnosis, though closer scrutiny of manpower is undoubtedly a factor. Explanations offered for this wartime increase in peptic ulcer are mental and physical strain, irregularities in dietary habits, nutritional deficits, and increased consumption of tobacco.

The pathogenesis of peptic ulcer in its fundamental aspects remains obscure, although clinical and experimental studies have established the importance of what may be called contributory factors. The individual who has a tendency to form peptic ulcer must regard himself as suffering from a permanent handicap. Recurrence or flare-up may result at any time from environmental stress, relaxation of dietary care, or for unaccountable reasons. The erratic course of the disease must be kept in mind by the internist and surgeon in evaluating any method of treatment. Prolonged observations should be made of the patient's condition following surgical treatment, and it would be well if the surgeon recorded the results of operation in terms of five- or ten-year periods as in the management of cancer.2 Whenever possible the handling of cases of peptic ulcer should be the responsibility of a gastro-enterologic team, including internist, surgeon, radiologist, and gastroscopist. Such combined study of the patient's course and analysis of response to treatment will result in healthier patients and will facilitate clinical research.

The surgical treatment of gastric ulcer gradually has undergone a considerable degree of standardization. Earlier procedures such as excision or cauterization of the ulcer with or without gastro-enterostomy, pyloroplasty various types, sleeve resection, excision of pylorus and antrum, and gastric resection without removal of the pylorus have given place to subtotal gastric resection in which three-quarters

Read at the Annual Meeting of the Medical Society of the State of New York, Buffalo, May 6, 1943. From the Department of Surgery, University of Buffalo Medical School, and the Edward J. Meyer Memorial Hospi-tal, Buffalo

of the stomach and all of the pylorus are excised Whether or not Edkins was right in his supposition that the mucosa of the pylorus and antrum elaborates a hormone which stimulates the secretion of acid, there is considerable clinical evidence supporting the importance of removing the pyloric mucosa completely in subtotal gastric resection for ulcer. Excision of the pylorus and two-thirds to three-quarters of the stomach reduces or abolishes acid secretion and diminishes the amount of mucosa involved in gastritis.

A further technical goal is a rapidly emptying stoma. The operation which enables us to attain these objectives most satisfactorily is the subtotal resection with anterocolic Holmeister gastrojejunostomy. Jejunojejunostomy is not performed. The incision selected depends on whether the stomach is high or low with respect to the costal margin, whether the ulcer with its surrounding inflammatory reaction is in the proximal or distal half of the stomach, and whether the patient's abdomen is long and narrow or short and broad. In about half the cases we use a left subcostal incision and in the rest a left paramedian vertical incision with lateral retraction of the rectus muscle. Ether and oxygen administered in a closed system through an intratracheal catheter and supplemented by infiltration of procaine into the properitoneal tissues about the wound is our choice for anesthesia.

In an occasional case we have found the transdiaphragmatic approach useful in subtotal or total gastric resection for large, high penetrating ulcers. The induration and inflammatory infiltration about a high posterior wall ulcer, whether benign or neoplastic, may involve the cardiac end of the stomach. Anastomosis of jejunum to esophagus or remnants of the fundus by laparotomy may be technically difficult and unsafe under such circumstances. A much better exposure can be obtained, particularly if the diaphragm occupies a high position in relation to the costal margins, by entering the thorax through the bed of the ninth rib on the left, sectioning the pulmonary ligament, and incising the left dome of the diaphragm. Either a total or subtotal gastrectomy can be done without difficulty, and it has seemed to us that the patients have less postoperative discomfort than they do after laparotomy. The pylorus and antrum are quite accessible in this manner, although in one patient who had an old healed duodenal ulcer in addition to a high posterior

wall gastric ulcer we had some difficulty in closing the duodenal stump.

Owing to improvements in surgical technic and anesthesia, better preoperative and postoperative care, and the use of the sulfonamide drugs, the risk of subtotal gastrectomy for ulcer as described is no longer prohibitively high. If a surgeon's postoperative mortality rate is greater than 3 or 4 per cent (except in cases with acute massive bleeding), he should subject his methods to critical analysis, as being unsatisfactory for this purpose. The internist or family doctor should take a keen interest in this point when surgical treatment comes to be considered.

When subtotal gastric resection is performed for gastric ulcer, how effective is the procedure in reducing digestive invalidism and preventing recurrent or marginal ulcer? The immediate relief that the patient with a penetrating gastric ulcer obtains from properly performed gastric resection is striking, even within the first two or three days after operation. Pain disappears, sedative is no longer needed, and the patient has restful nights. Such patients are among the most grateful whom the surgeon sees. Whether the patient remains completely free from digestive difficulties will depend to some extent on his behavior. These patients should be told before operation that they will have a much higher degree of alimentary health, but nevertheless they will not be able to disregard sensible rules of eating. Eating too rapidly, taking oversized meals or coarse food, excessive indulgence in alcohol or tobacco may be followed by jejunitis, gastritis, cramps, and diarrhea. It may be stated in general, however, that the results of subtotal gastrectomy for gastric ulcer are entirely satisfactory in over 95 per cent of the

The incidence of recurrent gastric or jejunal ulcer following subtotal gastrectomy for gastric ulcer is hard to estimate accurately, but unquestionably the complication is rare. In a followup study of 162 cases by questionnaire, Walters found no evidence of gastrojejunal ulcer in a period of one to five years after operation, and in only one case was there possible bleeding.3 Kiefer observed uniformly good results in 49 patients with gastric ulcer treated by subtotal gastric resection. The time interval after operation is not precisely noted in his report.4 It is of interest that gastrojejunal ulceration is found somewhat less rarely after gastric resection for duodenal ulcer. One wonders whether this would hold if equally extensive resection were done for duodenal ulcer and if the ulcer was invariably removed.

What are the indications for subtotal gastric resection in the treatment of gastric ulcer? In

general, surgical treatment should be advised when complications of ulcer develop and when there is doubt as to the benign nature of the ulcer. The complications are perforation, obstruction, hemorrhage, and penetration. Perforation and obstruction will not be discussed, but we shall deal briefly with hemorrhage and penetration and finally with the cases in which suspicion of carcinoma must be held.

The question of whether to operate on severely bleeding peptic ulcers has been discussed lengthily and testily by internists and surgeons, and opinion still remains divided. As is often true in medicine, the confusion arises in the lack of a body of accurate data, and in the existence of variables which we have no knowledge of or which we cannot control. As an obvious example, the skill of the available surgeon and anesthetist is a point of utmost importance in deciding on the course to be followed, yet this factor cannot be standardized. The extent of blood loss, previous nutritional state, ability to compensate for hemorrhage, the size of the vessel eroded by the ulcer, and the inflammatory fixation of the vessel wall which prevents its contraction are values which influence the outcome of treatment and yet are hard to appraise in the case at hand. Statistics show that fatal bleeding is considerably more apt to occur in the older age group and some clinicians base their choice of surgical or nonoperative treatment on the age of the patient. Thus, immediate operation is favored in the group over 50 years of age, but not in the younger patients. Age is not so accurate a yardstick of physiologic reserve as this conception implies, and the practice of medicine would be less entertaining if it were. Undoubtedly, the older patients as a group are less able to make the adjustments to blood loss, but this consideration may be of little help in a particular case. What if the patient exceeds the arbitrary age limit by two, five, or eight years?

For our part, we incline to surgical treatment of severely bleeding gastric (or duodenal) ulcer, the only contraindications being doubt as to diagnosis and inability to obtain the large amount of blood needed in restorative therapy. Operation should be done as soon as possible, but not before time has been taken for infusion of blood and physiologic salt solution in large amount. Blood transfusion is continued during the operation and afterward. A common error in the management of these cases is to give too little blood. The amount of blood that is vomited may be far less than the total lost, and the blood pressure and pulse reactions may return to normal before deficits of hemoglobin and plasma protein have been completely met. Ether is

given through an intratracheal tube with a high oxygen admixture, and oxygen therapy is continued after operation. The operation of choice is subtotal gastric resection, the ulcer-bearing area being included in the part removed.

#### Case Reports

The following illustrative cases are presented:

Case 1 .- G. S., a 62-year-old white man, was brought into the hospital with a history of epigastric pain, vomiting of blood, and passing loose, dark stools for thirty-six hours. Twenty-three years previously he had had an operation in another hospital for "removal of stomach ulcers," and thereafter had little trouble with his digestion. At admission there were pallor, thirst, hypotension, epigastric tenderness, and tarry feces at rectal examination. The blood pressure was 88 over 64, the pulse rate 100; the red cell count was 2.2 million and the hemoglobin 7 Gm. per 100 cc. Being influenced by the fact that the patient was known to have arteriosclerotic hypertensive heart disease and realizing that the previous gastric operation would complicate the present technical problem, we put the patient on a regimen of frequent milk and cream feedings, blood transfusions, infusions of physiologic salt solution and 5 per cent glucose, and sedatives. Following several of the transfusions, the patient had severe chills, but nevertheless he did fairly well until the ninth day in the hospital. He then showed evidence of further severe hemorrhage, vomited up much blood, and evinced the signs of circulatory collapse.

After the administration of a liter of blood, the patient was operated upon. Another liter of blood was given during the course of the operation, both arm and leg veins being used simultaneously. Subtotal gastric resection with resection of the jejunum and end-to-end anastomosis was performed under intratracheal ether anesthesia. The blood pressure and pulse remained stable throughout the operation. A posterior wall gastric ulcer 2.5 cm. in diameter was found near the lesser curvature and proximal to a well-functioning gastro-enterostomy. Convalescence was interrupted by basal pulmonary atelectasis on the right and mild wound infection. The pathologist found the gastric ulcer to be benign.

Case 2.—H. S., a 47-year-old man, was admitted to the hospital with a history of epigastric pain, persistent vomiting of bloody material, tarry stools, and a loss of 10 pounds in weight over a period of two weeks. For the previous nine years he had been troubled with frequent bouts of epigastric distress and pain, relieved by food or soda. On examination the patient was found to be anemic, and there was diffuse epigastric tenderness without spasm. The red cell count was 3.1 million per cm., the hemoglobin 10.5 Gm. per 100 cc. were black and gave strongly positive tests for blood. The serum urea nitrogen was 10 mg. per 100 cc. and the protein was 6.0 Gm. per 100 cc. The patient was treated by blood transfusions, liquid diet, and vitamin preparations given orally and parent-

erally. Vomiting, pain, and evidence of bleeding continued and accordingly subtotal gastric resection was performed two weeks after admission. Two penetrating ulcers were found. One, in the anterosuperior wall of the first part of the duodenum, had involved the inferior aspect of the left lobe of the liver, while the other, in the posterior wall of the midportion of the stomach, had penetrated the pancreas. Convalescence was uneventful except for superficial phlebitis of the internal saphenous vein at the site of infusions. Examination of the operative specimen by the pathologist confirmed the diagnosis of benign penetrating peptic ulcers.

Criticism might be raised of the handling of both Case 1 and Case 2 on the grounds that operation should have been done earlier. Early operation—i.e., within twenty-four hours after admission—is a rational general plan in our opinion, time being taken only to meet fluid and transfusion needs.

Penetration of the gastric ulcer is a common complication leading to surgical treatment. Pain which is intractable on a careful medical regimen suggests that the gastric ulcer has involved the serosa of the stomach, or has burrowed into neighboring viscera such as the pancreas, liver, or intestine. Upper abdominal pain radiating around to the back, or pain referred to the base of the neck anteriorly indicates involvement of pancreas or diaphragm. Penetration often results in the erosion of a large vessel and severe hemorrhage may be the consequence. Such secondary effects of penetration as pancreatitis and gastrointestinal fistula may bring the patient into the hands of the surgeon. There is usually no difficulty in persuading this group of patients to be operated upon, and they suffer so much that they may urgently demand surgical relief of their doctors. The immediate as well as the late results of operation are gratifying. The operation of choice is subtotal gastric resection in most instances, but it is occasionally necessary to remove all the stomach in order to extirpate the ulcer satisfactorily. If the ulcer has penetrated neighboring viscera, the operative plan will vary according to the circumstances. It may be desirable to carry out the surgical treatment in stages and to excise involved portions of other organs, such as the pancreas and colon.

Brief illustrative case reports follow:

Case 3.—P. T., a 63-year-old man, was brought into the hosital giving a history of recurring bouts of pain, of two years' duration, in the left hypochondrium, radiating to the back. Nine months before admission he was told in another hospital that he had gastric ulcer, and at that time dietary management was recommended but was rather poorly carried out. Four weeks before admission the patient noticed the passage of soft black stools,

and much blood was vomited. There was loss of considerable weight, but the exact amount was unknown. The patient was admitted in a state of shock from blood loss. There were pallor, hypotension, and persistent tenderness in the left hypochondrium. The red cell count was 1.2 million, the hemoglobin 4.2 Gm. per 100 cc. The stools gave strongly positive reactions for blood and vomitus also contained blood. The serum protein value was 3.7 Gm. per 100 cc., the urea nitrogen 10 mg. per 100 cc. It was felt that the patient could not withstand immediate operation, and he was put on a regimen of repeated blood transfusions, infusion of amino acid solution, frequent feedings of milk and cream, and vitamin supplements orally and parenterally. During the course of three weeks, evidence of hemorrhage ceased, and the patient's general condition improved. X-ray showed a large penetrating posterior wall gastric ulcer just below the cardia. Since the ulcer was at the cardia and since the patient had a high diaphragm in relation to the costal margins, the transthoracic-transdiaphragmatic approach was used at operation. An indurated penetrating ulcer 3 cm. in diameter was situated on the posterior wall of the stomach, and the surrounding reaction involved the cardiac orifice. The pancreas had been invaded. Total gastrectomy was performed, and the jejunum was united to the esophagus, without supplementary jejunojejunostomy. The ulcer proved benign at pathologic examination. Convalescence was rapid and uneventful, and four months later the patient was free from complaints and was gaining weight.

In this instance the penetrating ulcer not only invaded the pancreas and caused severe pain, but it also caused massive hemorrhage and led to profound inanition.

Case 4.—R. M., a 50-year-old man, had been troubled for four or five years by recurring periods of epigastric pain, coming on one or two hours after meals and relieved by sodium bicarbonate. For six weeks before admission he had had intermittent diarrhea and constipation, and he had noticed black feces, loss of weight, and fatigability. For two days before admission he had vomited up coffee-grounds material. At examination the patient appeared emaciated, anemic, and cachetic. Epigastric tenderness was pronounced and localized. The red cell count was 1.1 million, the hemoglobin 5,7 Gm. per 100 cc. The serum protein concentration was 4.9 Gm. per 100 cc., there was free acid in the gastric juice, and the The x-ray examination stools contained blood. disclosed a penetrating ulcer in the posterior wall of the stomach near the lesser curvature with a definite fistula between the stomach and the distal transverse colon. The radiologic diagnosis was cancerous ulcer and fistula.

Surgical treatment was performed in stages, the first operation being the Devine, defunctioning ascending colostomy. The patient's improvement after this was striking, and he are ravenously. Six weeks later subtotal gastric resection and resection

of the colon at the site of the fistula were performed. Convalescence was uneventful, and the Devine colostomy was closed five weeks later. Now, six months afterward, the patient is free from symptoms and is back at work. The pathologic study showed a benign penetrating gastric ulcer with gastocolic fistula.

In his management of gastric ulcer, a point to be kept ever foremost in the physician's mind is possible error in diagnosis. Has the patient cancerous instead of benign ulceration, the symptoms of which may be relieved by dietary care, sedatives, and antispasmodics while the growth advances beyond possibility of cure? The grave responsibility involved in the nonsurgical management of chronic gastric ulcer is not properly appreciated by many physicians, despite the mounting literature on the subject. Doubt as to the benign nature of the ulcer is the indication for surgical treatment which is probably most often neglected, and with most disastrous results. When a gastric ulcer perforates, obstructs the pylorus, penetrates sensitive peritoneal coats, or erodes an artery, the patient and his doctor readily appreciate its seriousness, but unfortunately early cancerous ulceration may not force itself upon their notice by a compelling symptomatology. Three wellfounded statements which every physician who undertakes to treat gastric ulcer should frame and hang on his office wall are:

1. From 6 to 20 per cent of gastric ulcers, as variously estimated, become malignant.<sup>3</sup>

2. Malignant gastric ulceration may undergo symptomatic and x-ray improvement on the medical ulcer regimen.<sup>5</sup>

3. The curable gastric cancer is the one operated upon early.

Cancer of the stomach in this country vies with cancer of the lung in being the most common and most lethal cancer in the male, and it is responsible for about 100 deaths every twenty-four hours. In its earlier stages it can be cured by adequate surgical operation, and yet the cases continue to come to the surgeon dishearteningly late. In the Charity Hospital in New Orleans, as reported by Boyce, 70 per cent of the cases of gastric cancer were so far advanced on admission that even exploratory laparotomy was not worth while.

What are the findings which raise doubt as to whether a gastric ulceration is benign? These are summarized by Eusterman<sup>6</sup> as follows: (1) location in the prepyloric region, posterior wall, or greater curvature; (2) large size—i.e. 3 cm. or more in diameter; (3) absence of free hydrochloric acid in the gastric juice after histamine stimulation; (4) occult blood in the feces during

treatment; (5) late onset in an elderly individual. It has been repeatedly pointed out that there are cancer areas in the stomach, although the fact is as difficult to explain as is the immunity of the duodenal mucosa to cancer. Gastroscopic study by an experienced observer may be helpful in deciding whether the gastric ulcer is benign or malignant, but neither the radiologist nor gastroscopist can speak with assurance about the early case. Even the pathologist in some instances must examine serial sections of the ulcer before he can establish the diagnosis of cancer. Allen and Welch,7 as a result of careful and systematic study of a series of cases of gastric ulceration, recommend immediate surgery for any one of the following indications:

- 1. If the ulcer is of short duration and the patient is over 50 years of age.
  - 2. If the ulcer is over 2.5 cm. in diameter.
- 3. If there is no free hydrochloric acid in the stomach.
- 4. If the ulcer is in the greater curvature or in the prepyloric region.
- If the ulcer is chronic and on a lesser curvature.

Is it better to operate on the suspicious ulcer and find it benign, or postpone operation until the progress of the growth leaves no doubt whatsoever as to its nature?

Illustrative cases are briefly described below:

Case 5.—A. C., a 56-year-old man, gave a history of bouts of epigastric pain and distress relieved by food during a period of two years. Two months before the present admission, he had been under treatment in a hospital for his digestive complaints, the discharge diagnosis being chronic peptic ulcer. In the eight weeks since his discharge, he had been troubled with continuous epigastric pain, loss of weight and strength, and had noticed black stools. On admission the red cell count was 5.5 million, the hemoglobin 12.5 Gm. per 100 cc. Free acid was present in the gastric juice after histamine stimulation. The radiologic study showed a deforming prepyloric ulceration which was interpreted as being carcinoma. The preoperative diagnosis was chronic gastric ulcer with probable malignant change. An indurated ulcer 2.5 cm. in diameter was found at the pylorus, and radical subtotal gastric resection was performed with removal of the gastrohepatic and gastrocolic ligaments and the great omentum. Convalescence was uneventful. The pathologist reported chronic peptic ulcer with superimposed immature scirrhous carcinoma, and the regional lymph nodes were found to be involved in metastases.

This case falls definitely into the group in which peptic ulcer symptomatology is followed by gastric carcinoma. The pathologic evidence in this instance substantiated the view that the carcinoma arose in peptic ulcer. At his earlier

admission to the hospital the patient's physicians failed to recognize the danger of the gastric ulceration at the pylorus and did not recommend operation.

Case 6.—A. C., a 44-year-old man, gave a history going back five years of epigastric distress one or two hours after eating, with relief by food and alkali. Vomiting was frequent. Three years before the present admission, a perforated duodenal ulcer was closed at operation with satisfactory convalescence. The patient visited the outpatient clinic regularly and by faithful dieting kept his symptoms moderately well controlled. However, six to eight months before admission epigastric fullness and pain became more troublesome, and he noticed blood in the vomitus. He had a good appetite but was afraid to eat. At the patient's insistence his physician referred him to the hospital for surgical treatment. Results of the physical examination were negative and laboratory findings were essentially normal, except for a serum protein value of 5.4 Gm. per 100 cc. The gastric juice after histamine contained 26 units of free hydrochloric acid. X-ray study showed what was called healed duodenal ulcer and prepyloric ulceration with partial obstruction. At operation subtotal gastric resection was performed for what appeared to be a benign obstructing lesion. The patient made a rapid convalescence and at present, four months later, is without complaints. The pathologist's report in part read as follows: gastric side just at the pylorus is a firm contracted area as seen and felt, about 2 cm. in diameter. A distinctly invading mucinous carcinoma extending to the subserosa is present and there is some evidence to point to the possibility that the tumor may have originated in peptic ulcer. A distinct reactive inflammation is present. The lymph nodes examined showed no metastases."

This, then, was an early carcinoma probably arising in prepyloric gastric ulcer, and the prognosis after surgical removal would appear to be reasonably good. The patient himself deserves the credit for demanding surgical operation.

Case 7.-J. C., a 36-year-old white man, was sent into the hospital with a diagnosis of peptic ulcer. For eight or nine weeks he had been troubled with epigastric pain before meals and vomiting of partly digested food and brownish liquid possible containing blood. He had received some relief from powder and pills prescribed by his doctor. On admission there was epigastric tenderness at physical examination but no other abnormality. The gastric juice contained 61 units of free acid after histamine, the stools and gastric juice contained occult blood. The hemoglobin was 14.8 Gm. per 100 cc., and the serum protein value was 6.7 Gm. per 100 cc. Gastroscopic examination revealed an ulcerating lesion in the pyloric antrum, localized, and probably malignant. Radiologic study showed "a large, shallow ulceration on the lesser curvature near the angulus," and the lesion was interpreted as prob-

able malignant degeneration of peptic ulcer. With much difficulty the patient was persuaded to submit to an operation. A crateriform malignant ulcer was found, 6 by 4 cm. in diameter, on the anterior wall of the stomach just proximal to the pylorus. The lymph nodes did not appear to be involved. A radical subtotal gastric resection was done, with removal of the great omentum and the ligamentous attachments of the stomach, including the lymph nodes. Convalescence was uneventful.

In conclusion, gastric ulcer is often best treated by subtotal gastric resection, for the operation is reasonably safe, and it is highly effective in

the relief of digestive invalidism. Nonsurgical management places a grave responsibility on the physician in charge of the case.

#### THE HYGIENE OF COUGHING AND SNEEZ-ING

There would be fewer colds and much less tuberculosis, influenza, pneumonia, diphtheria, whooping cough, and other diseases spread by saliva if people only would learn to cough and sneeze properly, Lt. Samuel F. Harby, USNR, points out in the December issue of Hygeia, The Health Magazine.

"Whenever you feel a cough or sneeze coming on," he advises, "turn your head away from other people, and cough down at the floor. The thousands of small droplets of saliva which escape inevitably from your mouth as you cough are thus thrown down at the floor, where they have little chance of getting on your associates, and especially into their mouths to cause respiratory infection.

"Even if you were able to cover your mouth completely with your hand, so that no droplets, or spray could get by it, you would still fail to protect your associates from your germs, because your hand becomes soiled when you cough on it, and almost immediately afterward you touch other people, or the things which they will touch. Thus, indirectly, germs are transferred from your mouth to someone else's mouth or—what happens more frequently—to someone else's hand, food, eating utensil, or other object which will eventually reach his mouth. . . . .

#### HEALTH OF AMERICANS UNSCATHED BY FIRST YEAR OF WAR

American families, living far from the theater of combat, came through the first year of the war relatively unscathed. They were still enjoying the benefits of the good health service they built up during the preceding period of peace. Our excellent medical and public health facilities, together with our rising standard of living, made possible the marked gains in longevity. But there are definite signs that the conflict in which the nation is engaged made itself felt with much more weight in 1943. Current mortality data indicate that 1943 witnessed the first setbac: in longevity since 1929. This retrogression is doubt-less, in part, a product of the war. Our public health facilities can no longer expand as in the past; actually the supply of civilian physicians and nurses is materially cut down. Living conditions around many of our centers of war industry are far from satisfactory. The mounting losses in the armed forces and the tightened conditions of living of the civilian population will inevitably be written into the figures of mortality and longevity. when these become available at the close of the year.—Statistical Bulletin, Metropolitan Life Insurance Company

#### NEW TECHNIC MAY HELP DONORS GIVE BLOOD MORE FREQUENTLY

Preliminary studies, reported in the Journal of the American Medical Association for February 5, indicate that by reinfusing into donors the red blood cells that are left after the plasma has been separated, the frequency of blood donations might be safely increased to the point where the entire plasma requirements of the armed forces might be obtained from a vastly smaller number of persons than is now possible under the system of eight-week intervals between donations.

From their findings in a study of 6 volunteer donors who were subjected to frequent blood dona-

tions, each one followed by a reinfusion of the red cells, Co Tui, M.D., New York; F. C. Bartter, M.D., Brooklyn; A. M. Wright, M.D., New York; and R. B. Holt, M.D., Washington, D.C., already are able to recommend "that the practice of reinfusion of red cells into the denses be adonted where fusion of red cells into the donors be adopted where there is malnutrition in the donating population and/or where a large proportion of the donors are women." More extensive studies will be necessary, the investigators and the conthe investigators point out, before it can be concluded how much more frequently it will be safe to bleed donors provided red cells are reinfused.

#### X-RAY DIAGNOSIS OF BRONCHOGENIC CARCINOMA

G. NEWTON SCATCHARD, M.D., Buffalo

ONE of the most important malignancies with which we have to deal is bronchogenic carcinoma. This is true because it is the second most frequent malignancy in the male. Carcinoma of the stomach is the only one which occurs more often. In our clinic we see two lung carcinomas to every three which we see in the stomach. The ratio is even as high as one to one in some clinics. This lesion kills 15,000 yearly in the United States and accounts for approximately one-tenth of all the cancer deaths.

The second reason that it is important is that if the diagnosis can be made before extensive or distant metastasis has occurred it may still be an operable lesion. The rapid progress of thoracic surgery has changed bronchogenic cancer from a hopeless lesion to one in which successful operation can be anticipated in a reasonable number of cases. The cure rate in operable lesions in this condition is probably higher than in operable gastric cancer.<sup>2</sup> The best that can be hoped for with x-ray therapy is palliation.<sup>3</sup> If there is any possibility that the lesion is operable, it should be operated upon as soon as possible and x-ray therapy should certainly not be tried.

If the extremely high mortality rate of this common malignancy is to be lowered, it is imperative that the diagnosis be made accurately and early. In order to do this, there must be close cooperation between the clinician, bronchoscopist, thoracic surgeon, pathologist, and roent-genologist.

Early diagnosis is the first important step, without which we cannot hope to lower the mortality rate. The roentgenologist bears great responsibility here. He cannot make the diagnosis alone, however. His duty is to suspect the lesion and report this suspicion, in order that the additional required studies may be done without delay.

The usual first step after the x-ray is reported to be suspicious is bronchoscopy. This is essential. In 50 to 75 per cent of cases the lesion can be seen and biopsied, thus definitely establishing the diagnosis. Some clue as to the operability of the lesion can also be obtained. The most important thing to be stressed here, and a point which is not often fully appreciated, is that there are some 25 to 50 per cent of the cases in which the bronchoscopist cannot visualize the lesion. With these figures in mind, we see that carcin-

oma of the lung is not ruled out when the bronchoscopist cannot see the cancer.

This brings us to the rather large group of cases which are the most difficult to diagnose—the ones located away from the larger bronchi, which cannot be seen by the bronchoscopist but appear clinically and radiographically to be malignant. Numerous partially satisfactory approaches to this problem have been suggested, such as pneumothorax, lipiodol studies, aspiration biopsy, examination of the sputum for tumor cells, etc. None of these methods is adequate and some are dangerous or complicate the surgical procedures to be done later. They are also time-consuming. They have proved to be of little help in our experience.

We believe that exploratory thoracotomy has an extremely important place in establishing the diagnosis in the group of cases we are discussing.7 It is not an especially hazardous procedure in the hands of a well-trained thoracic surgeon. We believe, as do others, that it is no more formidable in the proper hands than is exploratory laparotomy. There are many cases in which this is the only sure method of establishing the diagnosis. If at operation the preoperative impression of primary malignancy is established, by frozen section or other means, and the lesion proves to be operable, it can be removed with no further delay. I believe that as the procedure becomes more widely accepted and is done early, the mortality rate in bronchogenic carcinoma will be lowered. Procrastination because of dread of an operation or to see if the lesion may not disappear in a month or two, or for the trial of x-ray therapy before subjecting the patient to an operation, may allow sufficient time for some of the operable cases to become inoperable.

We are all well aware of the extreme variability of both x-ray and clinical findings in this condition. This variability seems to depend almost entirely on mechanical factors. The carcinoma may arise in any portion of the bronchial tree. The resulting x-ray findings depend on the size and location and on the secondary pulmonary effects. To illustrate this, it seems best to take up the various types seen and attempt to explain them on this mechanical basis.

The most common type and the one usually considered as the classical picture is that which shows at electasis of a lobe (Fig. 1). This occurs when a tumor arises in one of the first-order bronchi, which it obstructs, causing an entire

lobe to become atelectatic. In this type, there is usually some growth of the tumor outside of the bronchus, making a tumor mass which

There is one type which cannot be seen by x-ray. This causes no obstruction and is an ulcerating lesion in a large bronchus. Dry cough and hemoptysis are the usual symptoms. Such a lesion is easily demonstrated by the bronchoscopist. These are frequently inoperable when discovered.8

can be seen by x-ray in the proper projection.

Carcinoma arising in this same portion of the

Fig. 3.

bronchial tree but tending to infiltrate outward into the parenchyma makes the so-called hilum nodular type of carcinoma. Here the x-ray shows a tumor mass, usually pretty well circumscribed, close to the hilum and infiltrating the lung (Fig. 2). This is a transitory type and as the lesion progresses it almost always causes obstruction of the involved bronchus, followed by atelectasis of the lung tissue supplied by it.

In some cases, the obstruction to the bronchus is only partial. Such patients at first, if there is a ball-valve action present, develop an emphysematous area or lobe, which can be readily demonstrated by x-ray. Later in the disease, as the obstruction becomes more complete, such a lobe becomes dense and solid, due to infection. Here the resulting density of the lobe, which is expanded rather than shrunken, may give the impression of unresolved pneumonia (which is always dangerous). We call this type the pneu-

monic type. Closely related to this group is the somewhat more frequent type which may be called "cavitary." This type forms cavities either in the tumor itself, as a result of poor blood supply to the central portion, or, more frequently, in the atelectatic lung beyond the obstructing tumor as a result of infection and abscess formation When such lesions occur in the upper lobe they are easily confused with tuberculosis (Fig. 3). In other locations they are most easily mistaken for lung abscesses. The diagnosis of tuberculosis should be made with caution when such a lesion is unilateral, when the general clinical picture indicates more systemic reaction than would be expected, and, most important, when in the

Fig. 4.

Fig. 5.

presence of cavitation tubercle bacilli cannot be demonstrated. The differentiation between carcinomatous and simple lung abscess is often impossible by x-ray and must depend upon the bronchoscopist.

The "diffuse type" of bronchogenic carcinoma is, fortunately, rare. Here a whole lobe or even a whole lung may be studded with numerous apparently discrete tumors of varying size scattered through the lung tissue.

Another rather common type is the one which resembles a tumor of the lymphoblastoma group Here the primary tumor is located centrally and metastatic masses fill the mediastinum (Fig. 4). The only atelectasis seen in these cases is due to compression by the masses of tumor tissue. When no tissue is available for biopsy in such cases, a trial of x-ray treatment as a therapeutic test is justifiable. If the masses do not recede in a week or ten days it can be assumed with some certainty that the lesion is bronchogenic carcinoma.

The peripheral lesions are the most interesting from the diagnostic standpoint and tend to be the most hopeful surgically. These arise in the smaller bronchi in any portion of the lung and usually are infiltrating, although some may appear well circumscribed (Fig. 5) These tumorusually cannot be seen by the bronchoscopist Cases falling in this group may be mistaken for benign tumors or for inflammatory lesions. If, after careful study, no adequate explanation is found for the lesion, even if it is well circumscribed, exploratory thoracotomy must be performed as a diagnostic procedure. A rather large proportion of these peripheral, infiltrating,

or even apparently circumscribed lesions will turn out to be malignant. Procrastination in doing a thoracotomy here may be fatal, as these are the most favorable group from the surgical standpoint and delay may allow the tumor to become inoperable.<sup>10</sup>

Peripheral tumors may occasionally remain small when they are in contact with the pleura but may cause massive pleural metastases to occur. These may be so extensive as to completely obscure the primary tumor both to the radiologist and to the pathologist, giving the

Fig. 6.

impression that these are primary, pleural tumors (Fig. 6). Usually a careful search at postmortem will reveal the relatively small bronchogenic carcinoma.

In conclusion, I believe that the x-ray can demonstrate most early bronchogenic carcinomas if the condition is kept in mind and searched for, and that if immediate bronchoscopy is done in all suspicious cases and exploratory thoracotomy is done early in properly studied cases as a diagnostic procedure and followed by a pneumonectomy in operable cases, the mortality rate from bronchogenic carcinoma can be lowered. X-ray therapy is of great palliative value but

should not be used until the lesion is proved to be inoperable.

#### HOLMES AS A PSYCHIATRIST

The medical aspects of Holmes's career are being re-examined and re-evaluated. His place in American literature is secure, but many are asking what about his niche in American medicine? Did he, except for his outstanding contribution in 1843 to preventive medicine, the paper "On the Contagiousness of Puerperal Fever," exert any considerable influence on the trend of medical thought or leave buried in his writings material not fully appreciated at the time of its writing, or since? Undoubtedly the stamp of Holmes's dynamic character left an impression on a generation or more of the medical students who attended his anatomic lectures. He gave an impetus, moreover, to the public demonstration of the administration of ether by coining the term "anesthesia," stimulated research with the aid of the microscope, and used his vast influence in 1875 to re-establish the Boston Medical Library for his generation and for posterity. These are, however, as time has listed them, minor contributions. What else did Holmes add to the medical scene? What about the "medicated novels," and Holmes as a psychiatrist?

Little attention has been paid to Holmes's interests in mental abcrration or to Holmes as a clinical psychiatrist. It is now realized, thanks to the re-searches of Oberndorf,\* that Holmes was long a profound student of mental disease and that he had pronounced and advanced ideas on mental mechanisms. Possibly hesitant about presenting his thoughts before his medical colleagues, or at least doubtful about their acceptance in the form of a medical paper, he chose the medium of the novel to bring his opinions before the public. Neither Elsie Venner (1859) nor The Guardian Angel (1867) was a literary product of excellent quality when compared with contemporary works of Poe, Thackeray, and Hawthorne. But they were studies of the abnormal mind, and simple though the stories are, both books give us an insight into Holmes's profound psychiatric understanding. His doctors, moreover, com-bine, as noted by Oberndorf, "those qualities so desirable in every physician but indispensable in a

psychiatrist-namely, patience, forbearance, tolerance, equanimity, accurate observation of the patient's actions and utterances, and unremitting consideration for the patient's psychological and en-

vironmental handicaps."
Following the novels, Holmes became so engrossed in the theme of the social significance of mental deviation that he chose this subject for his address to the Phi Beta Kappa Society at Harvard in 1871. "Mechanism in Thought and Morals," as the paper was called, was withheld from publication for more than twenty years, and only after careful revision, expansion, and annotation had taken place did Holmes allow it to appear in print, hidden in Pages from an Old Volume of Life (1892). There, this address, with its modern flavor and psychoanalytic leavings has been allowed to rest nearly uppatied. leanings, has been allowed to rest nearly unnoticed. In this essay will be found opinions strangely similar to those so reluctantly accepted by the medical profession after they were re-emphasized by Freud forty years later. In the brain, Holmes considered, there persists a material record of thought; and secondly, this transmissible record is not at all times available to the person for the control of his actions. Are these ideas not the "indestructibility of infan-tile thought and impressions" and the "importance and influence of unconscious mentation"—the foundation stones of Freud's psychoanalytic structure? ture? At least Oberndorf thinks so, and his book makes a strong case in Holmes's favor. Except for a pleasant whimsicality, so characteristic of Holmes, the following passage from his address might well have been written by Freud in 1910:

There are thoughts that never emerge into consciousness, which yet make their influence felt among the perceptible mental currents, just as the unseen planets sway the movements of those which are watched and mapped by the astronomer. Old prejudices, that are ashamed to confess themselves, mudge our talking thought to attentible megisterial nudge our talking thought to utter their magisterial veto. In hours of languor, as Mr. Lecky has remarked, the beliefs and fancies of obsolete conditions are apt to take advantage of us. We know the state of the conditions are apt to take advantage of us. very little of the contents of our minds until some sudden jar brings out the old stockings full of gold, and all the hoards that have hid away in holes and

crannies."—New England J. M.

<sup>\*</sup> Oberndorf, C. P.: The Psychiatric Novels of Oliver Wendell Holmes, New York, Columbia University Press, 1943.

#### THE SIGNIFICANCE OF ABSENT PHARYNGEAL AND CORNEAL REFLEXES IN CUTANEOUS DISEASES

THOMAS N. GRAHAM, M.D., and GEORGE M. LEWIS, M.D., New York City

THERE are a number of diseases reported in the dermatologic literature in which absent corneal and pharyngeal reflexes are offered as evidence suggesting a psychogenic origin. Cases of dermatitis factitia, neurotic excoriations, trirhotillomania, and psychogenic pruritus have been reported to show an absence of these reflexes. A number of investigators have recorded their belief that a loss of these reflexes in dermatitis factitia is important in differentiating this dermatosis from neurotic excoriations. Dermatitis factitia is regarded as a manifestation of hysteria, while neurotic excoriations and trichotillomania are considered to be compulsion neuroses. This confusion concerning the significance of the corneal and pharyngeal reflexes in psychogenic dermatoses has prompted us to review the literature on the subject and to make a comparative study of these reflexes in known dermatopsychotic patients, in patients with other dermatoses, and in normal individuals.

#### Review of the Literature

The first reference in the literature to corneal anesthesia due to hysteria was published in La Vérité des Miracles in 1747. A Mme. Stopart had been cured of blindness of ten years' duration which affected her left eye. There was complete anesthesia, as a finger could be placed against the cornea without producing any sensation or movement. A final cure was effected by a "miracle treatment," suggesting, according to the concept of many present-day observers, that the absent corneal reflex was a result of hysteria. Absence of the pharyngeal reflex appears to have first been described as a symptom of hysteria in 1872 by Austie2 in the Lancet. The absence of corneal and pharyngeal reflexes may, of course, be due to organic lesions along the nerve pathways that are involved. In these instances, the signs are of greater importance when they are unilateral and are associated with other evidence of nerve distur-

There is considerable disagreement among neurologists regarding the significance of absent corneal and pharyngeal reflexes as stigmas of hysteria. According to Wechsler3 "bilateral loss of the corneal reflexes is a well known stigma of

Read at the Annual Meeting of the Medical Society of the Read at the Annual Meeting of the Steudar Code, State of New York, Buffalo, May 6, 1943.

From the Department of Medicine (Dermatology), New York Rospital, and the Cornell University Medical College.

hysteria." He states that the bilateral absence of the pharyngeal reflex is also frequently astigma.

McKendree states that the corneal reflex may be, but is not always, absent, and that the pharyngeal reflex is not infrequently absent in hysteria.

We were able to find in the literature only three reports of studies of the pharyngeal reflex in normal individuals. Englehardt,5 in 1893, made tests of pharvngeal reflexes of normal and hysterical individuals. Of 200 normal individuals he found that 57 per cent showed a positive reaction, 18 per cent reacted partially, and 25 per cent showed an absence of the reflex. Of the 10 definitely hysterical subjects whom he examined. 7 showed positive reactions. Bircks, in 1894. tested the pharyngeal reflex in 200 normal persons and found 71 per cent to give positive reactions, 7 per cent to give sluggish reactions, and 22 per cent in which there was a complete absence of the reflex. Of 8 known hysterical persons whom he examined, he found a positive reaction to the pharvngeal reflex in 5, a slight reaction in 1, and no reaction in the other 2. He concluded that "the absence of the pharyngeal reflex is, therefore, not unusual in normal individuals and it is difficult to understand why it should be considered an important sign in the diagnosis of hysteria." Hurst,7 in 1920, placed little reliance on the absence of this reflex as an indication of hysteria. He stated "when care is taken to avoid suggestion, complete pharyngeal anesthesia is hardly ever found and the comparatively rare absence of reflexes is met with in normal people just as often as in patients with hysterical symptoms." This conclusion was based on a study of 170 nonhysterical cases and 64 hysteri-All, except one, showed a pharvageal reflex in one of the 7 degrees of excitability described by the author. These degrees of excitability ranged from "the anesthetic and no reflex" to "the maximal reflex making examination quite impossible." The single patient in whom complete pharyngeal anesthesia was present was, according to Hurst, a stolid individual.

We were unable to find in the literature any studies of the corneal reflex in normal individuals.

Lester<sup>8</sup> reported a known case of hysteria in which both the pharyngeal and corneal reflexes were present.

A survey of reports of cases of psychogenic dermatoses published in the Archives of Dermatology and Syphilology (Table 1) shows that

since the periodical's inception in 1920 there have been 22 reports. Of these 15 were patients with dermatitis factitia, of which 9 showed an absence of both corneal and pharyngeal reflexes.9 There was an absence of the corneal reflex in 2 cases in which the pharyngeal reflex was not recorded,10 and an absence of the pharyngeal reflex in 1 case in which the corneal reflex was not noted.11 Other reflexes reported in dermatitis factitia were a lowered pharyngeal reflex,12 and a positive pharyngeal reflex.13

There were 5 cases of neurotic excoriations reported. Two showed an absence of both corneal and pharyngeal reflexes.14 There were no cases in which both reflexes were present In 2 cases absence of the pharyngeal reflex was reported.15 One case showed partial anesthesia of both reflexes. 16 Two cases of trichotillomania were reported, in one of which both the pharyngeal and corneal reflexes were absent, 17 and in the other of which they were both present.18 There was also 1 case reported of generalized pruritus of the psychogenic type, which showed an absence of the pharyngeal reflex.19

#### Study of 375 Cases

In a study of the pharyngeal and corneal reflexes, we examined 375 individuals, of whom 15 had dermatoses of known psychotic origin, 24 had dermatoses in which there was considered to be a psychogenic factor, and 173 had various dermatologic diseases in which there was no psychogenic factor. In addition, we examined 163 normal individuals, including 65 first-year medical students at Cornell University Medical College, 60 first-year student nurses at the New York Hospital, and a number of interns, nurses, and physician's wives, whom, after careful consideration, we regarded as normal. The age range of 130 of these normal individuals was between 18 and 22 years. The age range of the other 43 was between 23 and 80 years.

#### Technic

The technic employed was as follows:

Pharyngeal Reflex.—The posterior wall of the pharynx was stroked with a tongue blade. In doubtful cases we exerted considerable pressure. A gag reaction constituted a presence of the reflex.

Corneal Reflex.—Each subject was seated on a chair facing directly forward, and asked to look upward and to the right, while the examiner, standing to the subject's left, touched the cornea of the left eye with a fine wisp of cotton. The examiner approached from the left side so that the subject was not aware that the test was being performed. A blink constituted a presence of the reflex. In a doubtful case the right eye was also tested. This description of the technic of the corneal reflex is essentially that described by McKendree.4

Each patient, except our normal subjects, was questioned to determine manifestations of hysteria other than dermatologic, and was excluded from the study in the event of evidence suggesting other forms of hysteria: We felt that our normal subjects were such a carefully selected group that it was unnecessary to question them regarding symptoms of hysteria.

#### Results of Tests

As noted previously, the subjects have been considered in four groups.

1. Of the 15 patients with dermatoses of known psychogenic origin (Table 2), 3 who

TABLE 2 -15 PATIENTS WITH DERMATOSES OF KNOWN PSYCHOTIC ORIGIN

suffered from dermatitis factitia showed an absence of both pharyngeal and corneal reflexes and 1 showed a pharyngeal reflex, and an absent corneal reflex. Two patients with neurotic excoriations showed the presence of both reflexes, 2 patients an absence of the pharyngeal and the presence of the corneal reflex. and 1 patient a pharyngeal and an absent corneal reflex. One patient with trichotillomania showed a positive pharyngeal and an absent corneal reflex. Two patients with psychogenic pruritus showed the presence of both reflexes, and a third case showed an absence of both.

2. The diseases in which there is considered to be a psychogenic factor (Table 3) included 6 cases of localized neurodermatitis, of which 3 showed the presence of both pharyngeal and corneal reflexes, and 3 showed positive pharyngeal and negative corneal reflexes. There were 6 patients with generalized neurodermatitis of whom 4 showed the presence of both reflexes, 1 showed an absence of both reflexes, and the other had a positive pharyngeal and a negative corneal reflex. Of four patients with alopecia areata, 2 showed a presence of both reflexes, and 2 showed positive pharyngeal and negative corneal

reflexes. Of 2 patients with chronic urticaria one showed a presence of both reflexes, and one an absence of both reflexes. In 2 cases of lichen planus both reflexes were positive. There were 4 cases of pruritus ani, in 2 of which both reflexes were present, and in the other 2 the pharyngeal reflex was positive and the corneal negative. We excluded from this group cases of urticaria and pruritus ani in which we were able to determine causative factors other than psychotic.

3. Our 173 miscellaneous dermatoses with no psychogenic factors (Table 4) included many different diseases in individuals of both sexes ranging in age from 8 to 81 years. We found that sex and age are apparently not factors in the reaction to the pharyngeal and corneal reflexes. We found the pharyngeal reflex absent in 46 cases, or 26.6 per cent of the total. The corneal reflex was absent in 72 cases. or 41.6 per cent. Both reflexes were absent in 16 cases, or 9.2 per cent.

In 56 cases, or 32.3 per cent, the corneal reflex was absent and the pharnygeal reflex present, and in 30 cases or 17.3 per cent the pharyngeal reflex was absent and the corneal reflex was present.

TABLE 4.-173 Miscellaneous Dermatoses with No Psychogenic Factor

Results of Testing Pharyngeal and Corneal Reflexes	Number of Cases	Percentage of Total Cases Examined
Pharyngeal reflex absent Corneal reflex absent	$\frac{46}{72}$	$\frac{26.6}{41.6}$
Both reflexes absent	16	9.2
Absent pharyngeal and present corneal reflex	30	17.3
Absent corneal and present pharyngeal reflex	56	32.3

4. An analysis of the 163 normal individuals who were tested (Table 5) showed an absence of the pharyngeal reflex in 53 cases, or 32.5 per cent, and an absence of the corneal reflex in 66 cases, or 40 per cent. Both reflexes were absent in 28 cases, or 17.2 per cent. In 25 individuals, or 15.3 per cent, the pharyngeal reflex was absent and the corneal reflex was present and in 38 instances, or 23.3 per cent, the corneal reflex was absent and the pharyngeal was present.

The percentage of absent reflexes in the medical students and the student nurses was approximately the same. This again suggests that sex is not a factor in the presence or absence of those reflexes.

#### Conclusions

A study of the pharyngeal and corneal reflexes in 375 individuals has convinced us that these reflexes are absent in many patients with dermatoses not of psychogenic origin and in many normal individuals.

The 4 patients with dermatitis factitia whom we examined all showed absent corneal reflexes, and 3 of them showed absent pharnygeal re-The other psychogenic dermatoses showed approximately the same percentage of absent reflexes as did our control cases. The number of psychotic cases in our series is, of course, small.

We believe that the simplicity of the technic employed in eliciting the pharyngeal reflex rules out any error in our study of this reflex. The comparatively higher percentage of absent corneal reflexes than of absent pharyngeal reflexes which we noted suggests that the more difficult technic of the former test may be a factor. The amount of pressure exerted on the cornea with the wisp of cotton, and the method of approach to the subject may be responsible for some variation in the results of the test, but it should not appreciably alter the interpretation of our findings.

Our study suggests that an absence of the pharyngeal and corneal reflexes is of limited significance in establishing a diagnosis of psychotic dermatosis, since these reflexes are frequently absent in normal persons and in patients

TABLE 5 .-- 163 NORMAL INDIVIDUALS

with dermatoses not of psychotic origin. Since our review of the literature and the findings in our own cases of dermatitis factitia show a high percentage of absent reflexes, we believe that a presence of these reflexes is evidence against this diagnosis.

#### Discussion

Dr. Howard Fox, New York City-The authors have made a real contribution in studying the action of the pharyngeal and corneal reflexes in a large number of normal persons, including those with dermatoses that had no apparent psychogenic background. I was astonished to hear that partial or complete absence of one or both of these reflexes was demonstrated in such a large proportion of supposedly normal people. The authors stated that in 173 persons with miscellaneous nonpsychogenic dermatoses the pharyngeal reflex was absent in 26.6 per cent and the corneal in 41.6 per cent and in 163 normal persons, the pharyngeal reflex was absent in 32.5 per cent and the corneal in 40 per cent. In this connection, I would like to mention the statement of Dr. L. A. Salmon that at the Neurological Institute of New York little or no significance is attached to a bilateral diminution or absence of such reactions from a diagnostic standpoint of either organic or functional disease of psychogenic origin. Dr. Salmon was impressed, however, with the rather high percentage of absent reflexes in cases of neurotic excoriations and also in the so-called normal persons.

As the authors state, the number of their cases of known psychogenic origin was small. This number included two cases of pruritus which I would eliminate, as its cause would be difficult to prove. The thirteen remaining cases included dermatitis factitia. neurotic excertations, and trichotillomania. All except two of these had absence of one or more reflexes. At least, this proportion of absent reflexes was much higher than that in normal persons. I assume that intheir list of cases of dermatitis facitita. they did not include cases of definite malingering which might not have a psychogenic basis.

I would criticize their list of 24 cases "in which there is considered to be a psychogenic factor." This included localized neurodermatitis, disseminated neurodermatitis, alópecia areata, lichen planus, and pruritus ani. I would exclude all of these except disseminated neurodermatitis (atopic eczema) and even in this disease the psychogenic factor can hardly be considered to be the basic cause of the disease. Localized neurodermatitis, a synonym of which is lichen simplex chronicus, has never been proved to have any psychogenic factor and the same is true of alopecia area and lichen planus, the cause of these diseases being unknown. Pruritus ani has so many possible causes that this disease could also be omitted. Of the six cases of disseminated neurodermatitis, the reflexes were normal in four.

I looked over my private cases of neurotic excoriations, a disease which is unquestionably of psychogenic origin. I was disappointed that I could find only 15 cases in which I had recorded the presence or absence of the reflexes in question. Of my 15 cases, 13 were women, of whom 9 were unmarried.

The average age of all the patients was 36. It was found that the pharyngeal reflex was either completely absent or greatly lessened in 80 per cent of the cases, and the corneal reflex was absent or sluggish in 77 per cent of thirteen cases, it being difficult to determine this in two cases. Finally.

there was a more or less complete absence of one or both reflexes in 86.6 per cent of my cases. Only 2 of the 15 patients showed normal reflexes. I assume that in testing for corneal reflexes the authors touched the edge of the cornea, and not the pupil. which would give an abnormally high percentage of reflexes, by acting through the second instead of the fifth nerve.

My conclusion from the limited number of cases of the authors and of my own is that absence of one or both reflexes, while not pathognomonic, is at least of some diagnostic value in neurotic excertations.

Dr. Graham-I wish to thank Dr. Fox for his discussion.

Dr. Lewis and I have listed cases of localized neurodermatitis, alopecia areata, lichen planus, and pruritus ani as "dermatoses in which there is considered to be a psychogenic factor" because this opinion is held by a number of dermatologists, and is recorded in some of the standard textbooks on dermatology. We are not convinced that this relationship necessarily exists. In reporting cases of pruritus ani we attempted to exclude those in which there might be any organic or metabolic basis.

As the technic employed in testing the corneal reflex is subject to some variation, we discussed this matter with two of the senior residents at the New York Eye and Ear Infirmary, Dr. Gordon J. Cole, and Dr. Hunter Romaine, and found that we had employed the correct technic. They volunteered to check our findings by testing the corneal reflex of subjects in the eye clinic. They tested 123 patients, most of whom were refraction cases. The others were patients with no diseases of the cornea and persons who visited the clinic in order to have a foreign body removed from the eye. Forty-one subjects, or 331/z per cent, showed an absence of the corneal reflex. Dr. Cole had previously been impressed with the considerable number of persons he had examined who had not been conscious of a foreign body on the cornea. These patients had noted only redness of the conjunctiva, and a number of them had not visited the clinic until several days later when the inflammation became pronounced. He regarded this as an indication that the corneal reflex was absent.

The findings in this study suggest the need for challenging some beliefs often noted in the medical literature, and taken for granted. The librarian at the New York Academy of Medicine remarked when we borrowed Birck's paper on a study of the pharyngeal reflex in normal persons, that it was the first time the copy had been taken out of the library since it had been received in 1894.

With women taking the place of men in almost every classification, we haven't heard of any female auctioneers. Perhaps it's because a woman wouldn't want to start the sale of an article by shouting: "Now, gentlemen, make me an offer."—From "Home Town News," in the Wichita (Kansas) Beacon, Dec. 6, 1943

### Case Report

### AGRANULOCYTOPENIA IN A PATIENT RECEIVING CINCHOPHEN AND SYNTHETIC VITAMIN K

WILLIAM B. RAWLS, M.D., New York City

ALTHOUGH cinchophen alone may produce agranulocytopenia, this case is reported because of the possibility that the agranulocytopenia may

have been caused by the synthetic vitamin K which was administered at the same time. A few cases of agranulocytopenia following cinchophen administra-

tion are cited in the literature, but Plum,1 in his book on the subject, could find only one instance directly traceable to cinchophen. This drug was administered to more than 500 patients over a period of years,2 some of them receiving natural vitamin K in addition, and frequent blood studies were done on all patients. No cases of agranulocytopenia were observed during that time. In view of the negative results in such an extensive series, it is possible that the agranulocytopenia which developed in the present case may have been produced by the

#### Case Report

synthetic vitamin K

A woman, aged 45, with severe rheumatoid arthritis of several years' duration, had taken aspirin, phenacetin, and neocinchophen at various intervals without any signs of toxicity. Beginning April 22, 1941, she received 71/2 grains of cinchophen three times a day, and 1 mg. of 2-methyl-1,4 naphtho-quinone (synthetic vitamin K) three times a day for six days, after which she complained of severe fatigue and general malaise, and had a temperature of 101 F. The medication was discontinued by the patient and she was not seen until three days later. At that time she complained of severe weakness, marked fatigue, and anorexia. The temperature ranged from 100 to 102 F. She was admitted to the hospital, where a blood count revealed agranulocyto penia.

Chart 1 shows the progress and treatment from April 30 to May 19. On May 7, the patient developed a high temperature, reaching 106.5 F., and was found to have lobar pneumonia involving the middle and lower lobes of the right lung. Because of the severity of the pneumonia, she was given sulfadiazine on the advice of Drs. John Carroll and Rufus E. Stetson of New York City. There was continuous improvement in the agranulocyto-The patient made a full recovery and her blood count has remained normal. Chart 2 shows

produce agranulocytopenia and, since synthetic vitamin K contains this radical, it is reasonable to assume that it may produce agranulocytopenia. It is difficult to determine whether it was responsible in this case but, if so, this is the first reported instance of synthetic vitamin K causing agranulocytopenia. Since this preparation is widely used, the possibility

#### THE HANDBOOK OF NUTRITION

The long awaited Handbook of Nutrition, published under the auspices of the Council on Foods and Nutrition of the American Medical Association, has just become available. As was announced when the first articles appeared in the Journal in 1942, all the articles have been brought together and revised and are now published in book form. The contents include such subjects as the fundamentals of modern nutrition, the essential elements in the diet, their sources in naturally occurring foods, and methods by which the greatest benefit may be derived from the consumption of cheap staple foods. Special attention is given to the dietary needs of special groups of the population. The book is invaluable as a reference for those in the field of nutrition and exceedingly useful to the physician who wishes to apply modern knowledge of nutrition in his practice.-J.A.M.A.

### Case Report

#### FEVER AS THE PRESENTING SYMPTOM OF BRAIN TUMOR

Bernard Brodsky, M.D., Lester Cohen, M.D., and Irving Gray, M.D., F.A.C.P., Brooklyn

TEVER of undetermined or obscure origin may sometimes be the only sign of disease, and the cause of such fever often taxes the ingenuity of the clinician. There is a paucity of reports in the literature on the occurrence of fever due to primary neoplastic disease of the brain. In an analysis of 51 cases of obscure fever, Keefer1 found tumor, irrespective of its location, to be the cause of an elevated temperature in 10 instances, but in no case did he report fever due to brain tumor. We are reporting this case, illustrating a fever which was present for eight weeks as the chief manifestation of a brain tumor, from the point of view of the internist rather than from that of the neurologist.

Case Report

L. B., Hospital No. 98044, a white woman 36 years of age, was admitted to the Coney Island Hospital on June 18, 1942, with the complaint of "fever and pains in the head for three weeks." This illness dated back to about three weeks prior to admission, when the patient "felt hot and the temperature ranged between 100 and 101 F., morning and night." There also had been more or less continuous pains "in the frontal region, which radiated around the eyes and which were relieved by aspirin and cold compresses." The pain recurred at intervals during the day, was predominantly left-sided, and was relieved by lying down. The patient had become increasingly fatigued. She had occasional diplopia and "spots before the eyes." She had been wearing eyeglasses for the past fifteen years. There were no symptoms referable to the cardiovascular, pulmonary, gastrointestinal, or genitourinary systems, the past history was essentially negative, and menses were normal. This woman was a Para I, gravida I, with one child 17 years old and in good health. Six years ago, the patient had had an operation for ovarian cysts. On one occasion (time not known), the patient was

told that she had sugar in the urine.

Family History.—Both the father and the mother of the patient were alive and well, but one brother had pulmonary tuberculosis. The patient's husband had bad ann tuberculosis to use here. band had had open tuberculosis ten years before. After repeated examinations, there was no evidence that the patient had developed pulmonary tuber-culosis. There was no familial history of diabetes,

carcinoma, or cardiovascular disease.

Physical Examination on Admission.—The temperature was 101 F.; pulse, 90; respirations, 20; blood pressure, 110/72. The patient rested quietly in bed, not acutely ill. There was no trace of cyanosis or dyspnea. Examination of the eyes showed the pupils to be equal and regular with normal reaction to light and accommodation. Fundi revealed no abnormal findings. There was no evidence of papilledema or hemorrhage. Examination of the ears showed the tympanum to be intact and of a

pearly-gray color. There was slight congestion of the nasal nucous membrane and of the pharynt. Oral hygiene was fairly good. The tongue was normal in appearance, and the thyroid was not enlarged. No abnormalities were found upon extensive. amination of the lungs and heart. The extremities revealed normal function of all the joints, with no evidence of any swelling or tenderness. No rash or petechiae were found in examining the skin. Liver and spleen were not felt. There was no abdominal tenderness or muscle rigidity. On neurologic examination, there was no evidence of strabismus, nystagmus, or diplopia. The corneal reflexes were intact, and no trigeminal sensory changes were observed. Neither was there facial weakness, either peripheral or central. The palatal reflexes were intact and the palatal curtains were symmetrical. The tongue protruded in the midline, but there was no atrophy or fibrillation. No weakness of the muscles supplied by the n. accessorius was observed. The visual fields were grossly normal by confrontations. The muscle strength was normal in all extremities. All the tendon reflexes were elicited, although reinforcement was necessary. The abdominal reflexes were intact, and there was no muscle rigidity. Neither the Hoffmann nor the Babinski sign was elicited. No ataxia (cerebellar) was elicited in any extremity. Sensory status was hardened and the sensory status was physiologic throughout, with no impairment of the stereognosis.

Laboratory Studies.—Repeated examination of the urine for red blood cells was negative, but cultures of the urine showed Staphylococcus albus. Fecal studies and culture were negative for ova parasites and pathogens. Serologic tests for syphilis were negative. Blood culture studies made on several occasions were consistently negative, and blood chemistry studies were normal. Blood Widal tests for typhoid "O" agglutination was: positive, 1:20 through 1:160; negative, 1:320. Test for typhoid "H" was: positive, 1:20 through 1:80; negative, 1:160 through 1:32. Proteus OX19 was positive in 1:20. but it was negative in higher was positive in 1:20, but it was negative in higher titers. Agglutinations for paratyphoid A and B and

brucella were negative in 1:20 through 1:320. N.Y.C. Board of Health Studies.—On June 24 the Widal test was positive in "O" antigen through 1:40. Agglutinations were negative for paratyphoid A and B, brucella, and the typhus group. The sedimentation rate on lune 26 mes rules 152 with a sedimentation rate on June 26 was plus 158, with a maximum fall of 13 mm. (grossly elevated) in a five-minute interval. An electrocardiogram was made on June 25. There was a tendency toward left axis deviation; PR interval was 0.20 second. There was also a suggestion of myocardial damage (voltage tended to be low).

Radiological Study.—A chest examination made on June 19 was negative.

No abnormalities were demonstrated in a study of the skull, and no evidence of increased intracranial

The frontal cells of the sinuses were large, but pressure could be seen. the right side was not appreciably infiltrated or

From the Medical Service of Dr. Irving Gray, Coney Island Hospital, Brooklyn.

thickened. Both sides were aerated. The left side was not appreciably thickened. The ethmoids were bilaterally infiltrated. The sphenoid bones and the antra were also aerated. Turbinates showed a moderate hypertrophy on the left side. Sella turcica were normal, and the posterior pharvngeal wall was

There was no evidence of bone or joint pathology or paravertebral mass in the dorsal and lumbar spine. The paranasal sinuses, examined again on July 7, showed no change from the previous report.

Blood Count.-Blood counts on admission were as follows: white blood cells, 13,400 per cu. mm., with 87 per cent polymorphonuclear; red blood cells, 4,100,000 per cu. mm. Hemoglobin was 78 per

On June 27, ten days after admission, the leukocytosis still persisted-12,400-and the patient

still had a polynucleosis (80 per cent).

Clinical Course.—The patient continued to have a low-grade fever rarely exceeding 101 F., with a distinct facial pallor evident at all times. Repeated blood culture studies were sterile. At no time were there any petechiae found in the mucous membrane or in the skin, nor were there joint or skin abnor-Because of some contact the patient may have had with her husband, who was known to have had active pulmonary tuberculosis ten years previously, x-ray studies of the chest (and tuberculin tests) were made, and a diagnosis of tuberculosis was excluded. (The peculiar pallor of the skin at times seemed to be tinged with a light brown, cafe ou lait appearance. In the differential diagnosis, pulmonary tuberculosis, subacute bacterial endocarditis, atypical verrucous endocarditis, sinusitis, etc., were all excluded. The rapid sedimentation rate persisted, but the cause of the fever remained undetermined until about three weeks after admission to the hospital, when examination of the heretofore negative fundi revealed the presence of a bilateral papilledema of 2 or 3 diopters. Tenderness was elicited on percussion of the frontal area of the calvarium in the sagittal plane. There were no abnormal neurologic findings. A spinal tap was performed with the following results: initial pressure: 300 mm. water, 10 cc. withdrawn, final pressure, 148; Ayala's index (final pressure): initial pressure (×10) was slightly less than 5. This was considered strongly indicative of an expanding intracranial lesion. Chemical and microscopic findings in the spinal fluid were otherwise essentially within normal limits.

The bilateral papilledema became increasingly evident, although no adequate localizing diagnosis was made. On July 13, twenty-six days after observation at the Coney Island Hospital was begun, the patient was transferred to the Neurological Service of Dr. Jefferson Browder at the Kings County Hospital. At this institution, examination by the neurologic staff, including perimetry, revealed no abnormal neurologic signs other than the bilateral papilledema. Ventriculography showed a definite defect of the frontal horn on the left side, and a sphenoid ridge tumor was suspected. A left frontotemporal bone flap was reflected, and a large, tangerine-sized meningioma was exposed, occupying the inner half of the left sphenoid ridge and extending into the middle and anterior fossae. The tumor was completely removed, with amputation of the left frontal lobe. The pathologic report was "meningioma of the fibroblastic type." After a very start was very stormy postoperative course, the patient was di-charged, recovered, on September 10, 1942. The

temperature returned to normal after the operation and has remained normal since.

On December 7, 1942, three months after the operation, the patient was examined again. headaches had disappeared, she felt much stronger, The temperature was and had no complaints. 97.9 F., and the pulse rate 102. (The patient stated that she felt "nervous.") Examination of the fundi revealed a linear hemorrhage nasal to the left disk. (There was no evidence of papilledema.) Although the sedimentation rate was still elevated, the blood count was within normal limits.

#### Discussion

For a period of three weeks prior to admission to the hospital, and for three weeks after admission, the patient continued to have a fever of obscure origin. At no time were there any localizing signs of disease pointing to the central nervous sys-

Without the use of the opthalmoscope, the encephalon would not have been suspected of being the seat of disease. Although the tumor was located in the sphenoid ridge, clinical or radiologic signs generally considered characteristic of tumors in this region were not present, and localization was

achieved only by ventriculography.

An instance of prolonged fever and headache caused by a cystic gliomatous left frontoparietal tumor is reported by Marcolongo.<sup>2</sup> In this case, however, there were bouts of unconsciousness, somnolence, and mental torpor to point to the central nervous system. This author makes the statement that "frontal lobe tumors are accompanied by fever in 23 per cent of the cases." Bailey3 says that meningiomas, even when they compress the hypothalamus in advanced cases, do not seem to give rise to hypothalamic symptoms. It is difficult, in the case we are presenting, to impute that the fever was due to hypothalamic compression. Five cases of tumor involving the hypothalamus with associated hyperthermia are reported by Davison.4 One of these case reports describes an invasive meningioma of the base of the brain which destroyed part of the hypothalamus. before this patient had had an attack of fever and lethargy which was then diagnosed as encephal-

He subsequently developed localizing signs indicative of a lesion in the left side of the brain. The patient had a temperature, ranging from 98 to 102 F., for a period of three weeks. Mental changewere present, and the patient had episodes of laughing and crying. The only other finding that might have been considered of hypothalamic origin was the slight polycythemia.

Zimmermans also describes a case of fever associated with brain tumor. In this author's case, the patient had an intermittent fever of one year's duration. There were associated symptoms such as dyspepsia, anorexia, and weakness. As in the case we are presenting, the patient was studied for some systemic febrile disease. The diagnosis in Zimmerman's case was arrived at only by necropsy. The tumor was small and seemed to involve only the temperature centers in the hypothalamus.

From a review of these case reports and from our

own experience, we believe it reasonable to conclude that fever on occasions may be the only manifestation of brain tumor.

#### Summary

- 1. A case of meningioma of the sphenoid ridge with fever as the principal manifestation is reported.
- 2. The importance of ophthalmoscopic examination as a part in the diagnostic armamentarium of the internist is illustrated.

#### OLD NOSTRUM RIDES AGAIN

For some reason or reasons, perhaps connected with public psychology in war or in some way related to the burden of taxes, radio has rejuvenated patent medicines. In a great many of the better spots of the better broadcasts one is assailed by authority-timbred tones which bid the public strengthen itself with some special brand of vitamins or which emphasize the value of a particular panacea that, because it is like a shotgun prescription, will remove hair or curl the whiskers, as the sex might be. Or again the same long-suffering public is exhorted to purify its blood, to waken its liver, to unclog its nostrils, to move its bowels. Often too, these succulent radio voices add a touch of mystery and dignity by the mouthing of chemical terms. They set forth anatomic relationships clearly enough to be understood by a child, but not by an anatomist; and too frequently an amazingly simple physiology is inferred. Torch singers and sopranos take up the refrain and drag into millions of living rooms little songs and jingles, some of them very catchy too, all to the glory of self-dosage; and often it is only through the courtesy of some proprietary that one gets spot news or good music or a thrilling drama of the air. Some of these radio prescriptions are new and sail confusingly in the wake of modern Others are so hoary in their iniquity that the medical profession was under the impression they had been laid to rest by federal laws as to claims and labels, and newspaper ethics as to advertisements. But they live again on the radio; cut a little smoother and thinner, but the same old sausage.

Regardless of the particular proprietary that sponsors and irrespective of the broadcasting company, or of script writers, performers, and announcers, there is a strong tendency in most programs to lead listeners so easily and pleasantly down the path of self-diagnosis that self-treatment seems quite logical; and the uninitiated can hardly wait to get to the drugstore. From an advertising standpoint, no doubt, such an outcome spells shining success: there is something to be sold, and, by the eternal, it is being sold; and the contracts go rolling along. But from the standpoint of the medical profession and of those interested in the public health

this radio-nostrum alliance is a discouraging and alarming phenomenon. How or when the situation may be rectified, no one knows, for both interests are powerful. The radio industry is literally bursting at the seams with vigor and ambition, possessing in full measure both the promise and crudeness of youth. It is apparently willing and able financially to fight for what it believes to be its prerogatives, and judged on the basis of past programs, these prerogatives include the right to further in the United States a patent medicine-guzzling citizenry. patent medicine industry for its part is no babe in the woods when it comes to taking care of itself. It knows just where effective pressure may be put and just how to put it; it knows just where the legal ice is thin, and, correspondingly, it knows where it may safely do a therapeutic razzle-dazzle.

For the above reasons and others, one may not hope for any early restrictions in radio advertising of patent medicines. It is too profitable an alliance for any of the high contracting parties to permit the public to "infringe" and, further, it is tied up with that reform-defying, resistance-smashing, and magic institution, Commerce. And ladies and gentlemen, when majestic Commerce enters into any situation the lowly and poor relations of government and society had better seek shelter, for public health history is replete with records of the pressures that commercial interests can bring, such as denial of the presence of an epidemic or insistence upon the right to sell inferior goods, including drugs, to the unsuspecting at home and abroad. Legislators, health officers, physicians, and others interested in the public welfore home than the public welfore home the public welfore home the public welfore home the public welfore home the public welfore the pu fare have thus learned that in any clash between public health and Commerce, the public is willing to take a long and thorough drubbing before it rises in its wrath. Fortunately, but usually at long last, the Right may hope to prevail. In the meantime, and in the present radio patent medicine situation, one is inclined to ask, "How long, O Lord, how

And now the least distressing part of the situation is that these patent medicine shows, in their radio excellence, put to shame the sincere but nevertheless dull efforts of conventional health educaton.—Editorial in Am. J. Pub. Health, February, 1944

# ARMY TRAINS MEN WITH POOR VISION FOR LIMITED MILITARY SERVICE

About a thousand men a week, a majority of whom were rejected for active military service because of defective vision, now are entering the Army's Limited Service School for special training, according to the Better Vision Institute. Men with visual shortcomings of the school which with the school school with the school with t visual shortcomings entering the school, which gives a months's intensive training, outnumber two to one the men with all other defects combined. These men

with poor eyesight have only about one-tenth to one-twentieth of normal vision. Although one out of seven of the men with nonvisual shortcomings are rehabilitated for general military service, very few of the men with eye defects are reclassified for general service. By utilization of the men from the general should be a subset of the service of the se school, thousands of other soldiers have been released for combat service.—Connecticut State M. J.

### Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this section of the JOURNAL. The members of the committee are Oliver W. H. Mitchell, M.D., Chairman (428 Greenwood Place, Syracuse); George Baehr, M.D., and Charles D. Post, M.D.

#### Tropical Medicine

A SINGLE lecture has been arranged by the New York State Department of Health and the Medical Society of the State of New York for the Saranac Lake Medical Society. It will be given on April 5, 1944, at 8:00 p.m. in the John Black Room, Saranac Laboratory, Saranac Lake.

The title of the lecture is "Mosquito-Borne Diseases."

The lecture will be delivered by Morton C. Kahn, Ph.D., associate professor of public health and preventive medicine at Cornell University Medical College.

#### REPORT ON AMENORRHEA IN WOMEN INTERNEES

From the Santo Tomas Internment Camp in Manila, in the first scientific paper from enemy-occupied territory to appear in medical literature, comes a report of war amenorrhea... in a group of American and British women internees, probably due to severe psychic shock, worry, and fear. An outbreak of the condition in central Europe during and after the last world war was attributed to malnutrition.

The study is reported in the Journal of the American Medical Association for February 12 by Frank E. Whitacre, M.D., Peking, China, and Benjamun Barrera, M.D., Manila, P.I., with the assistance of Tirso N. Briones, M.D., Purificacion S. Suaco, B.S., and Alicia De La Paz, M.D. The report comes from the College of Medicine and the Institute of Hygiene, University of the Philippines, and was brought back by Dr. Whitacre on the "Gripsholm" last December. Before the war he was professor of gynecology at the University of Peking Medical School. His present address is Sylvania, Ohio.

"Soon after our arrival at the Santo Tomas Internment Camp in Manila, Philippines, on January 4, 1942," say the authors, "a high incidence of amenorrhea was noticed. In the middle of June there were 3,134 internees, of whom 1,172 were women. All but 26 of the latter were American or British. Of the 1,172 there were 1,042 between the ages of 14 and 45 years. By April it was evident that the high incidence of amenorrhea had persisted and among the 1,042 women of menstrual age we were able to find 125 patients with amenorrhea which had developed since the outbreak of the war. Many complained of irregular menstrual periods, but only a few patients suffering from menorrhagia were seen. The menses returned in many instances after several months' absence. . . . It was suspected that the cause of the amenorrhea was an endocrine one, and in spite of the shortage or absence of some reagents and laboratory animals, which limited quantitative determinations, it was decided to attempt to investigate the cause of this condition."

As the authors explain, there are many possible causes of secondary amenorrhea, including malnutntion, glandular disturbances, the wasting diseases, chronic intovications, emotional disturbances, and certain nervous and mental disorders.

Their concern, however, they point out, was with

amenorrhea as associated with war. European investigators of the condition as found in the last world war considered that the most important cause was a deficiency in one or more of the essential food factors.

"In many of our patients," the authors say, "the menses stopped abruptly after the first bombing of Manila or soon after internment and before a food deficiency could have any effect..."

deficiency could have any effect....."

The investigators say that inasmuch as it seemed clear that emotional shock had much to do with the cause of the widespread amenorrhea they thought it desirable to study the effect of such shock on excretions into the urine of sex hormones from the ovaries and of gonadotropin from the anterior pituitary gland. The latter is a substance which stimulates the gonads or ovaries.

In 2 selected patients they found estrogen or female sex hormone was absent from the urine but that pituitary-like gonadotropin was present.

Very little reference is made by the authors to the difficulties under which their investigations must have been made. They do explain, however, that "Owing to the limitation in the number of rats available, quantitative findings as to gonadotropin in the urine were not very satisfactory, but it was at least demonstrated to be present. If it had been present in excessive amounts, one would assume that permanent ovarian damage was present, which carries a poor prognosis for the patient.....

a poor prognosis for the patient....
"The ovaries not only are influenced by other endocrine glands but are under the control of the autonomic nervous system. As distinguished from the causes of amenorrhea as reported from central Europe during and after the first world war, malnutrition and other factors were not important in the causation of the war amenorrhea observed in Manila. We believe that severe psychic shock, worry, and especially fear caused a suppression of ovarian function by way of the autonomic nervous system, thereby removing a possible inhibitory effect of estrogen on the anterior lobe of the pituitary.

trogen on the anterior lobe of the pituitary.

"Most of the women ... overcame the difficulty themselves after a few months. Psychotherapy is within the bounds of good medical practice, and suggestion or assurance that no permanent harm will result from the condition] may have helped some of these patients..."

### Medical Legislation

Bulletin No. 5 Issued by the Legislative Bureau of the Medical Society of the State of New York, February 14, 1944

IT IS urged that you write immediately to your legislators protesting against the enactment of the chiropractic bill. You will find in the preceding bulletin (Bulletin No. 4, March 1 issue, page 527) a statement of the objectionable features. The chirality of the constitution of the co ropractors are very active this year. The committee that made an investigation of chiropractic in this State has issued a report which will be published and, when it is, we shall have copies available for distribution. We still hope that the full minutes of the hearings may be published.

#### New Bills Introduced

Senate Int. 637-Heller, in relation to the practice of certain nurses: Referred to the Civil Service Committee.

Comment: Same as Assembly Int. 803-Crews, reported in Bulletin No. 4.

Senate Int. 646—Baum; Assembly Int. 881—Stuart, transfers from Public Health Law to Criminal Code the provision for regulation and control of autopsies; strikes out the requirement that the coroner, after autopsy, shall file with the State Health Commissioner a transcript of pathologic appearances and findings with diagnosis of cause of

death. Referred to the Health Committees.

Comment: This bill was introduced at the request of the Department of Health. There seems to be no real reason for the coroner filing with the Department of Health the transcripts which the

law now provides.

Senate Int. 657-W. J. Mahoney, defines abortion and makes it a felony to commit abortion except a therapeutic abortion to save the life of the woman or to prevent impairment of health, to be performed only by a duly licensed physician in a recognized hospital after written opinions as to its necessity from two consultant specialists; a consultant making a false or misleading certificate shall be guilty of misdemeanor. Referred to the Codes Committee.

Comment: The Grievance Committee has

found it necessary that a better definition of abortion be drafted than the one in the law at the present time. This bill was introduced at the re-

quest of the Medical Society.

Senate Int. 663-Condon; Assembly Int. 961-Milmoe, prohibits use of certain titles or designa-tions of chiropodist or podiatrist or abbreviations thereof unless the person using the title is a duly licensed podiatrist and shall have met necessary requirements for the title or degree; the licensee may use the title "Doctor" or its abbreviation if qualified by the designation podiatrist or chiropodist. Referred to the Education Committees.

Comment: The Podiatry Law permits gradu-

ates of a full course today and those present practitioners who take a special course of study and examination under the Department of Education to write themselves as "Doctor of Podiatry." This bill would permit any of those podiatrists who are not included in the two groups mentioned above to write himself "Dr. —, Podiatrist," omitting the "of."

Senate Int. 688—Murray, relative to a person hold-

ing a city position in competitive class as a physician. Referred to the Civil Service Committee.

Comment: Same as Assembly Int. 186-Crews.

reported in Bulletin No. 3.

Senate Int. 798-Downey, requiring the Mental Hygiene Commissioner to provide for the treatment and care of honorably discharged veterans of World War II. Referred to the Finance Committee.

Comment: Same as Assembly Int. 768-Bor-

mann, reported in Bulletin No. 4.

Senate Int. 822-Griffith; Assembly Int. 1184-Stuart, strikes out the provision that the county tuberculosis hospital superintendent shall make personal examination of a patient applying for admission, or shall determine the financial ability of the person or his relatives to pay for care, and makes care and treatment a charge upon the county unlessome other county or city is responsible; the patient may be allowed to pay for care. Referred to the Internal Affairs Committee.

Senate Int. 827—Halpern, provides for taking testimony by commission, of physician, registered nurse, or automobile mechanic who rendered services to party in an action or special proceeding in New York City municipal court. Referred to the Codes Committee.

Comment: Senator Halpern carried this bill last year. It was introduced toward the close of

the session and killed in committee.

Assembly Int. 868—Austin, provides for commitment to and custody and discharge of mentally sick persons in state hospitals or licensed private institutions for observation, care, and treatment for three months before being adjudged insane. Referred to the Health Committee.

Mr. Austin carried this bill last Comment: year. It died in committee and was not approved

Assembly Int. 869-Austin, provides for the discharge of a patient of a state hospital if after a hearing the superintendent is satisfied that the patient is not violent or dangerous and has no homocidal or suicidal tendencies; only one application for discharge may be made within six months, and refusal to discharge shall be reviewable by the Mental Hygiene Commissioner with right of appeal to Supreme Court. Referred to the Health Committee.

Assembly Int. 968-L. Bennett, requires physicians to report cases of infantile paralysis to local health officer or state department; creates in State Health Department a division to investigate cause, mortality rate, prevention, and cure of infantile paralysis and allied diseases, and appropriates \$35,000.

Referred to the Ways and Means Committee.

Comment: Mr. Bennett sponsored this bill two

years ago. It was killed in committee and we op-

Assembly Int. 994—Brees, provides, in the absence of written notice of injury or death in workmen's compensation cases, or knowledge on the part of the employer of accident or death, that the burden is on the employer to prove that he was prejudiced by lack of notice or knowledge; increases from twelve to twenty-four months the time limit for contraction of disease, and requires the industrial commissioner to appoint expert consultants to act as a committee on occupational diseases, other than dust diseases, and to examine evidence in death benefit cases. Referred to the Labor Committee.

Assembly Int. 1033—Stuart, strikes out the provision for the charge upon the county of the care of inmates in state tuberculosis hospitals who are unable to pay or whose relatives are unable to pay. Referred to the Health Committee.

Assembly Int. 1110—Chency, requires State to reimburse cities, counties, and towns for 40 per cent of the cost of care of sick and disabled persons in hospitals for whom the municipality is responsible: \$5,000,000 is appropriated. Referred to the Ways and Means Committee.

Assembly Int. 1136—Barrett, eliminates settlement requirements as a factor in determining responsibility for public assistance and care, including hospital care; increases from 40 to 50 per cent the State reimbursement to localities for home relief; changes the amount of State aid for old age assistance, for aid to dependent children, and for assistance to blind. Referred to the Relief and Welfare Committee.

On Wednesday, February 9, the Legislature elected two regents to fill the places vacated by Dr. Madill's death and the expiration of Regent Bell's term of office. Mr. John P. Myers, of Plattsburg, was elected to fill the unexpired term of Dr. Madill and Dr. Stanley Brady, of New York City, was elected to succeed Regent Bell.

Senator Desmond asks for the continuance for another year of his committee created to study nutritional problems.

Assemblyman Moses asks for an appropriation of \$10,000,000 to provide for care of children of working mothers.

Assemblyman Shaw has introduced a bill which provides that the State Reconstruction Home at West Haverstraw shall be used for care and treatment of any crippled person, instead of persons under 21.

#### Action on Bills

Senate Int. 371—Burney.—Professions, license, military service. Reported.

Senate Int. 381—Wicks.—Butterine, etc.—sale to State institutions. Passed Senate; in Assembly Agriculture Committee.

Senate Int. 428—Baum.—Senator Baum has amended the bill which deleted from the Public Health Law that local boards of health must provide suitable places for treatment and care of persons with infectious diseases, by adding that they may provide for care and isolation of communicable diseases in a hospital or elsewhere.

Assembly Int. 176—Austin.—Mr. Austin has amended his bill, by adding as professional misconduct and cause for removal of a physician from the list of those authorized to render medical care under the Workmen's Compensation Law, the following: "That he has participated in the division, transference, assignment, rebating, splitting, or refunding of a fee for medical care."

Assembly Int. 461—Stuart.—Tuberculosis patients, state aid. Passed Assembly; in Senate Finance Committee.

Assembly Int. 602—Pillion.—Professions, license, military service. Third reading.

#### POSTWAR CIVILIAN FLIERS NEED EYES LIKE BIRDS

With thousands of persons planning to buy the promised postwar inexpensive airplanes, a new field of human activity will be opened up that will require more efficient eyes than those that have guided motorists in the past, says M. J. Julian, president of the Better Vision Institute.

President of the Better Vision Institute.

"Birds have the sharpest, keenest eyes of all creatures, including man. They need such eyes," says Mr. Julian. "Postwar civilian aviators must strive for bird-like eyes. They will have to train and tune up their sight if they are to avoid the fate of Icarus.

"Civilian fliers will find new conditions of seeing in air motoring. On land it is possible even with inefficient eyes to judge distances and speeds by objects along the route of travel, but in the air those guides will be lacking, or are to be seen only remotely in new perspective. A land-lubber taking to the air easily might misjudge the distance, speed, and direction of another plane. Peripheral seeing, or vision from the side, will have to be trained, for if a civilian flier should not see another plane approaching to cut across his path at 150 miles an hour, the result would be disastrous.

"In operating automobiles millions of persons

have been very neglectful of their eyes. Instead of keeping them tuned up to top efficiency, such persons have depended upon their brakes and the maneuverability of their cars to dodge hazards. But planes have no brakes comparable to the automobile's pneumatic four-wheel brakes. Also, because of the nature of flying, it will be hard to change in a split second the course of a plane traveling 100 miles an hour.

"In land motoring visual acuity, or sharpness of vision, is the principal concern of traffic officials in respect to eyes of drivers. That also will be important in the air motoring of the future. But other visual factors must receive greater attention," continues Mr. Julian. "Among these are eye coordination, muscle balance, and depth perception. The newly studied condition known as aniseikonia, in which the images on the two eyes are of different size, promises to be important. Studies indicate that this defect is not rare. In aniseikonia the eyes find it hard to see on a level line. This condition tends to cause a flier to tilt his plane in cruising and landing. Instead of bending mud-guards, an aniseikonie flier probably would break wings when landing."

### J. A. M. A. Says Army Specialized Training Program Needed for Physicians

DISCUSSING the announcement relative to the discontinuance of the Army Specialized Training Program, the Journal of the American Medical Association for February 26 says that this program is the only technic that has been found for assuring an adequate supply of physicians for the Army, the Navy, and the civilian population regardless of the duration of the war. Pending decision as to the program, the Journal advises, every premedical and medical student is urged to continue with his studies and to realize that completion of his medical training is the best contribution he now can make to the war effort. The Journal says:

"Since the United States entered the war, the maintenance of medical education by provision of a continuous flow of premedical and medical students has given great concern to medical educators and to officials of the Selective Service System and of the Army and Navy medical departments. Just when the Army Specialized Training Program seemed to be functioning with reasonable satisfaction, a new announcement relative to its discontinuance has come forth; now everyone involved is again on the 'anxious seat.' As we go to press, apparently the fate of the Army Specialized Training Program is being decided. If a decision has not already been reached, those concerned should realize that thus far the Army Specialized Training Program is the only technic that has been found for insuring automatically an adequate supply of physicians for the Army, the Navy, and the civilian population regardless of the duration of the war.

"Vice-Admiral Randall Jacobs, Chief of Naval Personnel, states in a message to the Journal that the Bureau of Naval Personnel has recently received many inquiries concerning reports that the Navy College program may be discontinued. 'All inquirers have been advised that the Navy Department has no plans to discontinue this program. The U.S. Navy is still expanding. The urgent need for technically trained young officers continues, and the colleges and universities participating in the V-12 program are doing a splendid job of producing such officers. While changing wartime conditions may, from time to time, necessitate revision in the quotas for the program in order to conform with the needs of the service, the Navy does not contemplate discontinuance of the

program.'
"Whether the war ends soon or is greatly prolonged, both premedical and medical students must be kept in school in numbers sufficient to provide for the medical needs of the next few years. The transfer of the medical students now in the Army Specialized Training Program to the Enlisted Reserve Corps, on inactive duty, assigned to premedical or medical schools, may not meet the needs of the situation. Previously there was great urrest in the student body because these young men were constantly confronted with a feeling of inferiority in relation to those in uniform. Many premedical students dropped their work to enlist. Medical and premedical students naturally wish to be 'in the war.' Before the inauguration of the Army Specialized Training Program it was becoming increasingly difficult to persuade such students that their duty in this war was the pursuit of their premedical and medical studies to prepare them properly for military and civilian practice.

properly for military and civilian practice.
"Fortunately the officials of the Selective Service System have been aware of the potential threat to professional education. On February 15, 1944, Activity and Occupation Bulletin No. 33-6 was issued; this states definitely the status of students at this time before the Selective Service Boards. Briefly, a registrant who is in training and preparation as a medical student in a recognized medical school is to be considered for occupational deferment during the period of such professional course, provided he is a full-time student in good standing, he continues to maintain good standing, and the institution will certify that he is competent and gives promise of the successful completion of his course of study. A student in premedical training is to be considered for occupational deferment if he is a full-time student in good standing in a recognized college or university and it if is certified by the institution that he is pursuing a course of study in this preprofessional field and if he continues his progress he will complete such a preprofessional course of study within twenty-four months from the time of certification. A registrant serving in a hospital or institution giving a recognized internship is to be considered for occupational deferment as long as he continues such an internship but for a total period not to exceed nine months. A national quota has been established for premedical students which states that the number must not exceed 50 per cent of the total average number of students in schools of medicine in the years 1938-1939 and

"While the decision as to the Army Specialized Training Program hangs in the balance, every premedical and medical student is urged to continue steadfastly in his work and to realize that completion of his training in medicine is the best contribution that he can now render for the war effort."

#### Physical Fitness in Industry

A PHYSICALLY fit home front, with men and women workers who can produce a maximum in the war effort, is the aim of a nation-wide program now being put into operation by the Federal Security Agency to curb absenteeism and other handicaps resulting from physical deficiencies.

Federal Security Administrator Paul V. McNutt, in announcing a commission of thirteen outstanding Americans to carry on the program in industry, asserted that "It is most important that all working men and women in America realize that

physical fitness in industry is as vital to our cause as it is with our armed forces."

Chairman of the commission to stimulate physical fitness in industry is Dr. William P. Jacobs, president of Presbyterian College, Clinton, S. C., a long-time leader in education, public affairs, and athletics

and athletics.

Dr. Jacobs announced a comprehensive program which will be taken directly to the nation's industrial executives, labor organizations, and community leaders with the hope of enlisting their

support in encouraging every worker to participate

in regular habits and evercises.

"This drive for physical fitness embraces not only the obligation of the individual to keep him-or herself in good condition for sake of self, but it is a patriotic duty," Dr. Jacobs said. "Our men and women in the armed services are giving so much that certainly we at home can spare a little time to keep ourselves fit to do the jobs at hand.

"The need for such a program has been proved beyond any doubt by the high percentage of absenteersm which can be traced directly to physical

failures."

The industrial physical fitness commission already has prepared booklets to inaugurate the program. There is a brochure for employers and labor organizations outlining how physical fitness can be brought to every plant in the nation, a community booklet to be distributed through national headquarters of the American Legion, showing how patriotic, civic, and other groups can cooperate, and an individual handbook for the workers themselves, carrying illustrations and brief descriptions of the variety of sports, exercises, and body-conditioning habits which can be offered everywhere.

This manual for the individual describes more than fifty spare-time physical activities, plus variations of each, from which men and women of every age and condition can choose for enjoyment and physical development Basic points stressed include: medical care, fresh air, sunshine, balanced relaxation, good food, proper sleep, and regular exercise. The gamut of exercising opportunities from a good stretch upon awakening to the more vigorous forms of athletics, such as football and boxing, is

described and illustrated "We believe," Dr. Jacobs said, "that with

cooperation from employers, employees, and communities that great strides can be made in a short time to increase the health and effectiveness of the workers of America. It will, however, take cooperation. Unless industry and industrial workers give real support, we will continue to fight on the home front under the handicaps of physical deficiencies which could be remedied to an important

Further details on the program and copies of the physical fitness books can be secured by writing to the Committee on Physical Fitness, Federal Security Agency, Washington 25, D. C., or any of

its regional offices.

Members of the industrial Physical Fitness Commission, besides Dr. Jacobs, are: Dr. C. Ward Crampton, chairman, Subcommittee on Institutional Planning, Committee on Physical Fitness; Dr. Warren F. Draper, Deputy Surgeon General, U.S. Public Health Service; Kermit Eby, Assistant Director, Research and Education, C.I.O.; L. B. Icely, chairman, Athletic Goods Manufacturers' Association; Jonas A. McBride, vice-president, Victorial Legislative Representatives. National Legislative Representative, Brotherhood of Locomotive Firemen and Engineman; Colonel Leonard G. Rowntree, Chief, Medical Division, National Selective Service; Robert J. Watt, International Representative of the A.F. of L.; Dr. Sherwood Gates, Director, Recreation Division, Community War Services; Dr. Charles P. Mc-Cormick, president, McCormick and Company; Stewart C. Paxton, National Industrial Recreation Association and Maryland State Industrial Recreation Association; Collis Stooking, Deputy Assistant Director of Program Development, War Manpower Commission; and R. H. Weaver, Director, Industrial Relations, Falk Corporation.

#### County News

Albany County

Dr. Frederick L. Good, professor of obstetrics at Tufts College Medical School and prominent Boston obstetrician, addressed the scientific session of the Albany County Medical Society on February 23. The title of his address was "A New Concept of the Mechanism of Labor."

Discussion leaders were Drs. Joseph O'C. Kiernan,

Arthur Wallingford, and Thomas Gamble.\*

Dr. Joseph S. Lawrence, executive officer of the Committee on Legislation of the Medical Society of the State of New York, spoke in Albany at a meeting of the Capital District Dental Hygienists.\*

#### Cattaraugus County

Dr. Harriet Northrup, Ellicottville's first young woman to become a medical doctor, has left to take a position as a pediatrician in Chicago. She will be associated with Dr. John L. Reichert.

Dr. Northrup, is a graduate of Cornell University and the Women's Medical College of Philadelphia. She served her internship at and was affiliated with the Buffalo City Hospital for three years.\*

#### Cayuga County

Physicians of the county society with their wives (njoyed the annual joint dinner of the staffs of the Auburn City and Mercy Hospitals at the Osborne Hotel on January 28. The wives of thirteen physicians in military service were honor guests.

· Asterus indicates that item is from a local newspaper

Dr. Raymond F. Johnson presided. Dr. Harry S. Bull, president of the county society, spoke briefly, citing the fact that more than 50 per cent of the members of the Cayuga County Medical Society are with the armed forces.

Dr. G. Perry Ross, chief of staff at the Auburn City Hospital, was introduced, as was Dr. Anthony Spadaro, secretary and treasurer of the Mercy Hospital staff.

Dr. W. L. Dorr, serving at the Sampson Naval

Station, was present in uniform.

An interesting blackboard talk on figures and numbers from remote periods of history down to the present time was given by Dr. H. I. Davenport.\*

Erie County

Returned from a first-hand investigation of malaria and other tropical diseases in Costa Rica and Guatemala, Dr. Stockton Kumball will teach that subject in the University of Buffalo Medical School. Dr. Kimball, associate in medicine and pharmacology in the School, also spent two months in study at the Army Medical School.

Dr. L. Edgar Hummel, assistant dean of the

Medical School and assistant professor of medicine, is in Guatemala making a similar study, and Dr. Richard C. Porter, assistant in medicine and pharmacology and a member of the Meyer Memorial staff, who previously took the Army Medical School course, also will teach a course on tropical diseases, along with other specialists.

Dr. Oliver P. Jones has been appointed head of

the department of anatomy, succeeding Dr. Donald

Duncan, who resigned

Establishment of a research professorship in pediatrics in the University of Buffalo Medical School and of the Statler Pediatrics Research Department in the Buffalo Children's Hospital has been announced. Dr. Edward M. Bridge, associate professor of pediatrics at Johns Hopkins University for fifteen years has received the appointment. He will conduct research in drugs used in the treatment of epilepsy, the water and sugar requirement of sick children, the care of premature infants, and other pediatric problems. At the University he will encourage and promote research in the diseases of children and stimulate interest in research among medical students.

Dr. Grant L. Rasmussen has been appointed associate professor of anatomy and Dr. Harvey P. Hoffman, a lecturer in medical economics.

#### Kings County

At the annual meeting of the Brooklyn Urological Society, the following officers were elected: president, Oscar P. Schoenemann, M.D.; vice-president, Francis Osterhus, M.D.; secretary-treasurer, Isadore Kimmel, M.D.

Some one hundred physicians attended the annual dinner meeting of the Brooklyn Gynecological Society held on February 4 in the Hotel Bossert Alfred C. Beck, professor of obstetrics and gynecology at the Long Island College of Medicine, was the principal speaker. Dr. James W. McManus, president of the society, presided.\*

John P. Gallo has received his doctor of medicine degree at Kansas City University of Physicians and Surgeons, Kansas City, Missouri, and started his internship at St. Peter's Hospital, Brooklyn, on March 1.\*

#### Monroe County

Dr. Benedict J. Duffy, president of the Monroe County Medical Society, gave a talk on "Venercal Diseases" at the meeting of the Rochester Pharmaceutical Association on February 10. The talk was illustrated with motion pictures.\*

#### Nassau County

Dr. Benjamin White Seaman, of Hempstead, Long Island, surgeon, has just retired from active practice.

His retirement was the subject of an editorial in the Hempstead *Newsday* of February 4:

The retirement of Dr. Benjamin W. Seaman will be regretted alike by his colleagues of the medical profession and the people of Nassau County. Dr. Seaman has been the pre-eminent physician and surgeon of the County for a generation. He is a man of such high ability in his profession, so dignified and impressive in his appearance and conduct, and possessed of such estimable traits of character that members of the profession long ago accepted him as a natural leader.

Dr. Seaman began his career somewhat as a protégé of the late Dr. J. Ensor Hutcheson. Both men were originally from Rockville Centre and when Dr. Hutcheson retired it was not long before Dr. Seaman filled the position of leadership and eminence the former had held so long.

Dr. Seaman's contributions to the profession and to Nassau County have been manifold. He has given counsel and aid to many younger members of the profession... He was closely associated with the late Dr. Harry Warner in the establishment of the first professional building in Hempstead, which has resulted in that village's becoming an outstanding medical center and attracted outstanding physicians, surgeons, and specialists to this county.

He was a major influence in the establishment of Meadowbrook Hospital by Nassau County... and he has given outstanding service as police surgeon since the establishment of the Nassau County Police Department in 1926. He was chief of the surgical staff of Nassau Hospital, a member of the Medical Board of Mercy Hospital, and a member of the Board of Managers of Meadowbrook Hospital from its founding....

In 1938 Dr. Seaman received the first Distinguished Service Award given by the Nassau Daily Review-Star in reconnition of his many services to the people of the County.

If Dr. Seaman continues his association with the various hospitals and with the group at the Professional Building in an advisory capacity in spite of retirement from active practice his choice will be welcomed by all.

#### New York County

The monthly meeting of the county society was held on February 28 at 8:15 P.M. at the New York Academy of Medicine.

Three speakers took part in the scientific program, the subject of which was "Symptoms, Early Diagnosis, and Treatment of Cancer." Dr. Henry W. Cave covered the subject "From the Standpoint of the Surgeon," Dr. Howard C. Taylor, Jr., "From the Standpoint of the Gynecologist," and Dr. George Clinton Andrews, "From the Standpoint of the Dermatologist."

The general discussion was led by Dr. Francis Carter Wood,

Dr. Stanley Brady has been elected to the position of Regent of the State of New York, representing the First Judicial District of Metropolitan New York.

At the Columbia University alumni day lunchcon, held on February 12, Drs. Eugene H. Pool and Walter P. Anderston were recipients of the Alumni Federation's gold medals for conspicuous alumni service.

Dr. Anna Goldfeder was one of the investigatorto receive a grant in 1943 from the Ella Sachs Plotz Foundation for the Advancement of Scientific Investigation to study the relationship between radiation effects and cell viability as indicated by induced resistance to transplanted tumors.

The establishment of a department of tropical medicine at Columbia-Presbyterian Medical Center has been announced. Dr. Harold W. Brown has resigned as dean of the School of Public Health of the University of North Carolina, Chapel Hill, to become the professor of parasitology under the new setup. He is also the first member of the faculty for training and research in tropical discases, which will function under the immediate direction of the DeLamar Institute of Public Health, a division of the medical school. The project was made possible by a grant of \$150,000 from the Josiah Macy, Jr., Foundation, which will also defray the expenses of a concentrated five-year program of research and teaching at the Medical Center.

Dr. Otto Loewi, research professor of pharmacology, New York University College of Medicine, will present the Rothschild Lecture at Beth Israel

#### The Chemical Transmission

#### Niagara County

At a joint dinner meeting of the Lockport Chamber of Commerce and the Lockport Council of Community Agencies held on February 11 Dr. R. H. Sherwood, of Niagara Falls, former president of the Niagara County Medical Society, was one of the speakers who discussed the Wagner-Murray-Dingell bill.\*

#### Ontario County

The Canandaigua Medical Society heard a paper by Dr. J. Wendell Howard, of East Bloomfield, on "Arthritis" at the monthly dinner meeting with Dr. C. Harvey Jewett on February 10.

Dr. James F. Maltman was host on March 9, when Dr. D. A. Eiseline was the reader.\*

#### Queens County

At the stated meeting of the county society held on February 29 Dr. Thomas A. McGoldrick, President of the Medical Society of the State of New York, spoke on "More Laws for Medicine." Senator James Murray gave an address entitled "Medical Care for the American People Through Social Insurance." The discussion was opened by Dr. Louis H. Bayer, Speaker of the House of Delay. Dr. Louis H. Bauer, Speaker of the House of Delegates of the Medical Society of the State of New York. Preceding the meeting dinner was served at the Forest Hills Inn.

#### Rensselaer County

Dr. A. M. Chapnick, a lieutenant in the Army Medical Corps, has been retired to inactive status and has returned to practice medicine in Troy.\*

#### Schenectady County

Lt. Comdr. Francis F. Schwentker of the Navy Medical Corps spoke on "Pioneering in Medicine" at the monthly meeting of the Brotherhood of the First English Lutheran Church in Schenectady on February 7.\*

#### Schoharie County

Dr. Ward L. Oliver has received a commission as Surgeon in the U.S. Public Health Service (R) and has been assigned to act as Director of Health in District No. 3, West Virginia Department of Health.

#### Ulster County

Dr. John F. Larkin, of Kingston, has been named health officer of the city of Kingston.

Dr. Larkin replaces Dr. Lester E. Sanford.

who was the health officer for fifteen years.

A native of Kingston, Dr. Larkin is a graduate of old Ulster Academy and of Long Island Medical College. He interned at the Long Island Hospital and was connected for five years with the health department of the city of Yonkers. He then returned to Kingston to begin his private practice.

Dr. Larkin served for five years on the Board of Health under appointment of Mayor Eugene B. Carey, and was on the board at the time that the present Kingston city laboratory was built. He is also a member of the board of managers of the Ulster County Tuberculosis Hospital. For many years he has been attending surgeon at the Benedictine Hospital, and is also a member of the Kingston Hospital staff. He is a past-president of the Ulster

County Medical Society.

In the last war Dr. Larkin served as a medical officer. He now has two sons in the service, one in the Army and the other in the Navy.

A practicing physician for the past twenty-five years, Dr. Larkin will continue his private practice.\*

#### Warren County

Dr. Wilfred A. Rose, of Boston, has opened offices for the practice of medicine in Glens Falls.\*

#### Westchester County

Dr. Benjamin F. Ritchey has been appointed a part-time medical examiner in the public schools of Yonkers, during the leave of absence of Dr. Francis J. McMahon, now a captain in the U.S. Army.\*

### Hospital News.

#### Parran Asks 65,000 to Join Cadet Nurse Corps

A CALL for 65,000 student nurses in 1944 was sent on February 24 by Dr. Thomas Parran, Surgeon General of the United States Public Health Service, to a meeting of the Committee on the Re-cruitment of Nurses of the National Nursing Council for War Service, held at the Council's headquarters

in New York City.

At the same time the annual meeting of the New York City Nursing Council for War Service, Inc., heard from Dr. Claude W. Munger, member of the procurement and assignment committee of the War Manpower Commission and director of St. Luke's Hospital, that plans were under way in Washington to increase the \$30 salary of members of the United States Cadet Nurse Corps to \$60 a month, plus maintenance, for the last six months of their

three-year training period.
Dr. Munger said that an amendment to the Bolton Act, establishing the Cadet Nurse Corps, was before Congress, which would give the President power to establish salaries above the \$30 minimum. ernment officials felt, said Dr. Munger, that \$30 was not sufficient for nurses in their final six months of training, when they would be sent to work in military hospitals alongside fully trained nurses.

Dr. Munger reported also that plans for a nationwide registration of nurses had been abandoned,

temporarily at least, because the Army had reduced its estimated requirements from 27,000 trained nurses to 10,000 for the current year. The Navy, however, he added, was still expanding and had not

reduced its requirements.

Mrs. Langdon P. Marvin, chairman of the Council, reported that 2,000 were admitted to the Cadet Nurse Corps from the New York area in 1943, which was an increase of 40 per cent over the number for the previous year. Two hundred

have been recruited in 1944, she added.

At the meeting of the national committee twentyfive persons were present, including heads of civilian groups cooperating in the campaign to enroll 65,000 student nurses. Miss Edith H. Smith, dean of the School of Nursing, Syracuse University, chairman, reported that 41,270 had been recruited during the last summer and fall, and that the spring enroll-

ment was encouraging.

The United States Cadet Nurse Corps, she said, now numbers 92,000 in all classes, including the 41,270 recruits. A special recruitment officer will be appointed for each state. In New York the officer will be Miss Agnes Gelinas, head of the School of Nursing at Skidmore College, Saragota Springs, affiliated with the Post-Graduate Hospital of New

#### Venereal Disease Clinic to Open at Bellevue

York City.

A FEDERAL Works Agency check for \$110,692.-46 turned over to Mayor F. H. LaGuardia on February 12 assured the opening on March 16 of a 200-bed center at Bellevue Hospital in New York City, where persons suffering from venereal disease will receive the most advanced treatments free.

Started more than a year ago, the center was constructed with \$290,000 in F.W.A. Funds appropriated under the Lanham Act, according to Dr. Edward M. Bernecker, Commissioner of Hospitals,

who will direct operation of the center.

The check is the first installment of a \$285,000 grant for maintenance of the center, which will be sponsored entirely by the federal government for the duration of the war. It is one of a number of such federally financed centers started throughout the country to prevent lessening of the nation's working and fighting capacity by venereal disease. After the war the City Department of Hospitals will have the benefit of the facilities if it provides maintenance funds.

The project will be known as the Rapid Treatment Venereal Disease Center. Under the F.W.A. budget, the center will employ 150 persons, including nurses, dictitians, educational and recreational staff, and laboratory, hospital, clerical, and maintenance workers.

Treatment of patients will be in charge of Dr. Evan Thomas, staff syphilologist at Bellevue, and Dr. Alfred Cohn, head of the City Health Department gonococcus research section. Dr. William F. Jacobs, Bellevue's medical superintendent, will be aided in administration by a commissioned officer of the United States Public Health Service, whose name will be announced shortly.

Correlated with the center, which will provide both outpatient service and full hospitalization, will be a 100-bed rehabilitation center on Welfare Island, which will be complete about April 1. Its program is expected to stress vocational courses, such as typing, radio repairing, garment making, and shop

#### Medical Social Service Aides Graduate

AS A RESULT of a joint training project spon-sored by the North Atlantic District of the American Association of Medical Social Workers and the Medical Social Service Committee of the United Hospital Fund, of New York, thirty-one medical social service case aides have been graduated and assigned for voluntary work in hospitals and a second class is in training. This is the first centralized course, including theory and supervised field work, that has ever been given in the medical social service field in this country.

At the first graduating exercises, Roy E. Larsen, president of the United Hospital Fund, presented certificates. Mrs. Curry Watson, chairman of the Nuclical Social Services Committee of the Fund. Medical Social Service Committee of the Fund, presided. Speakers were Miss Hazel Halloran, chairman, Medical Social Workers Committee; Sister Loretto Bernard, superintendent of St. Vincent's Hospital, and Dr. Morris Hinenburg, executive director, Jewish Hospital, Brooklyn.

Miss. Hellogy.

Miss Halloran, representing the professional

[Continued from page 638]

association, described the training course, which covers a period of thirteen weeks, during which twenty-six hours are devoted to theory and discussion and sixty-five hours to supervised field work in the medical social service departments of the following hospitals: Hospital for Joint Diseases, New York Hospital, St. Vincent's Hospital, of Manhattan, Brooklyn Jewish Hospital, and Long Island College Hospital. Each of these hospitals has one staff member who serves as training supervisor for the aides during their field work period. The "VCAs," as the case aides are called, always

work under the supervision of professional medical social workers. Their duties are assigned on the basis of their individual capacities and in relation to a list of services agreed upon by the professional committee. Each aide is pledged to serve a minimum of forty-eight days a year in the department

to which she is assigned.

In discussing the development of this project Mr. Larsen pointed out that through the partnership of lay and professional groups interested in this field, a new service was being launched to assist professional medical social workers in meeting the mounting problems in hospitals as we enter the hardest and toughest phase of the war.

Dr. Hinenburg discussed the benefits which the hospitals will obtain through the services of the VCA. In connection with this, he defined the professional purpose of medical social work, relating

it to the treatment of the social and economic factors affecting illness. He spoke of the need in hospitals for this specialized service, explaining that medical care, even when skillfully administered, cannot alone meet the needs of many of the hospital patients. He spoke particularly of the value of having another group of lay persons as informed observers of the need for individualized service in the hospitals in order to maintain the high standards of care which the sick require.

Sister Loretto Bernard spoke of the meaning of volunteer service to the individual, citing its value in personal satisfaction and growth in being able to provide service for those who are in need of as-

The committee responsible for this project includes, in addition to Mrs. Watson and Miss Halloran, Miss Theodate Soule, chairman of the North Atlantic District of the professional association; Miss Sadie Shapiro, director, social service department, Hospital for Joint Diseases; Miss Grace Cooke, director of social service, St. Luka's Hospital: Miss Charlotte Slutsky, director Luke's Hospital; Miss Charlotte Slutsky, director of social service, Brooklyn Jewish Hospital; Mrs. Margaret Fitzsimmons, director of social service, Long Island College Hospital; Miss Florence Cohen, educational director, Mt. Sinai Hospital; and Mrs Edith G. Seltzer, consultant on medical social service, United Hospital Fund. Mrs. Eleanor Bishop, associate consultant on medical social service at the Fund, is serving as instructor.

#### Improvements

The scope of the work of Sunny View Hospital in Schenectady, which since 1928 has been carried on for crippled children, especially for victims of infantile paralysis, has been enlarged to include "children afflicted with cardiac, diabetic, and asthmatic diseases and with difficult feeding problems," according to an announcement made by Dr. C. H. Wolcott, president of the institution.

at Plattsburg, after having been closed for a number of years, has been modernized and renovated for obstetric patients. The floor was originally designed as the obstet-

ric unit and has accommodations for twenty-five mothers and babies.\*

The entire sixth floor of the Physicians' Hospital

A\_new auxiliary fire alarm box has been installed in Pawling Sanitarium.\*

#### At the Helm

The X-Ray Department at New York Hospital announces the appointment, for the duration, of Dr. Harold L. Temple as acting radiologist. Dr. Temple will succeed Dr. John R. Carty, who has resigned because of ill health.

The appointment of Dr. Edwin J. Grace as clinical director of the Huntington Hospital has been announced by Harold A. Nehrbas, president of the hospital association.

Dr. Grace is head of the Grace Clinic and a member of the surgical staff of Kings County Hospital in Brooklyn. He is a graduate of Fordham College Medical School and before entering private practice served an internship at the Mayo Brothers'

Clinic in Rochester, Minnesota.

Three specialists from the hospital's consulting staff have been appointed as advisers in the principal divisions. Dr. Edward D. Truesdell will serve as surgical adviser, Dr. Adolph Anderson as adviser in medicine, and Dr. Richard N. Pierson as adviser in obstetrics.

\* Asterisk indicates that item is from a local newspaper.

Dr. Morris R. Keen will serve as president of the medical staff, Dr. Wilbur C. Travis as chief of the division of surgery, Dr. Neil N. Falkenburg as chief of the division of medicine, and Dr. Louis P. G. Couley, as active shift of obstatuies while Dr. Gouley as acting chief of obstetrics while Dr. Samuel Teich is in the Army.\*

Dr. John S. Hickman was elected president of the Chautauqua Region Hospital Service Corporation at the annual meeting of the Corporation held on February 8. Dr. Hickman succeeds Dr. Alfred E. Randell, who has moved to New York City.

A resolution was passed at the meeting expressing appreciation to Dr. Randell for his services as president of the corporation for the last four years. Other officers elected were: vice-president, J. Gustaf Sundin; secretary, Mrs. E. Snell Hall; treasurer, Harold C. White.\*

Dr. Carlos E. Fallon has been elected chief of staff of St. Luke's Hospital in Newburgh, to succeed Dr. John W. McKeever.

⋆.

The potentiation of the central action of phenobarbital by the belladonna alkaloids (Friedberg, Arch. f. exp. P. & P. CLX, 276) renders possible attainment of desired effects with relatively small doses, thus avoiding 'hang over' and other unpleasant side-actions. In contrast to galenical preparations of belladonna, such as the tincture, Belbarb has always the same proportion of the alkaloids.

Indications: Neuroses, migraine, functional digestive and circulatory disturbances, vomiting of pregnancy, menopausal disturbances, hypertension, etc. Formula: Each tablet contains ¼ grain phenobarbital and the three chief alkaloids, equivalent approximately to 9 minims of tincture of belladonna.

Belburb No. 2 has the same alkaloidal content but ½ grain phenobarbital per tablet.

Dr. Fallon, who will serve a three-year term, will be assisted by Dr. Frederick R. Small, who was named assistant chief of staff, and by Dr. Ruth Crabtree, who was re-elected sccretary. Drs. E. C. Waterbury and C. W. Layne were named as the executive committee.

Dr. Fallon has practiced in Newburgh for six-

teen vears.\*

Miss Margaret McVeigh is the new welfare director of medical social service at Staten Island Hospital,

Tompkinsville.

Miss McVeigh was recently with the North Atlantic Area Office of the American Red Cross. She was engaged in administrative work, directing home service activities of the Red Cross chapters in New Jersey and Delaware. She was concerned with caring for the needs of servicemen and exservicemen and their families.\*

Dr. Fred G. Jones has been elected president of the staff of St. Luke's Hospital, in Utica. He succeeds Dr. James W. Byrne.

Other officers elected were: vice-president, Dr. A. T. Goldstein; secretary-treasurer, Dr. A. Vernon Johnston; and executive committee, Dr. William H. Williams, Dr. Herbert W. Thomssen, and Dr. John W. Gromann.

Drs. Harry Davis and W. W. Wright were elected to the staff.\*

Francis L. Durk has been elected president of

the Brooklyn Eye and Ear Hospital.
Other officers are Louis S. Tiemann, vice-president; H. P. Schoenberner, treasurer; Dr. John H. Ohley, secretary; and Elliott M. Eldredge, s member of the board of directors.\*

Dr. Arthur M. Stokes, assisting superintendent at Homer Folks Tuberculosis Hospital, has been appointed superintendent at Mt. Morris Tuberculosis Hospital.

Dr. Stokes replaces Dr. N. S. Lincoln, Mt. Morris superintendent who has been appointed superintendent at Hermann Biggs Memorial hospital at Ithaca, to replace Dr. John K. Weegan, who has resigned to enter military service.

Dr. E. L. Leech, formerly assistant superintendent at Homer Folks Hospital, who is now at Hermann Biggs Hospital, will return to Oneonta

to replace Dr. Stokes.\*

#### **Newsy Notes**

Responding to an invitation from Arthur L. Zerbey, president of the board of managers of Mount Vernon Hospital, twenty-one representatives of eleven Westchester County hospitals, representing a capacity of approximately 1,800 beds, met at the Roger Smith Hotel, White Plains, on February 2 to inaugurate what is described as being one of the most important, helpful, and influential hospital lay-men's groups, from the business, operating, and economic standpoints, that has ever been organized in hospitals of this county

The idea originated with Mr. Zerbey and Vernon F. McClellan, treasurer of the Mount Vernon Hospital, in the interest of getting better acquainted, and of comparing hospital rates, operating costs, and methods. The group will consist of all hospital personnel, exclusive of professional employees, and will include members of the boards of directors of

all the cooperating hospitals.

Stressing the fact that doctors of the medical professions have their groups and hospital superintendents their associations, Mr. Zerbey said that the importance of hospital laymen's knowing each other better and exchanging ideas, plans, and suggestions would prove invaluable, and pleaded for "realization of the importance of our united position and its attendant responsibility."\*

address system will reach every room and every building of the hospital. More than \$2,600 already has been donated from various sources for its purchase, Mr. Douglas announced.\*

The Hospitals Division of the War Finance Committee for New York reported that up to February 17 a total of \$2,637,814 in war bonds had been sold by the division during the Fourth War Loan cam-The report was made by John McCormack, superintendent of Presbyterian Hospital, and Mrs. Donald B. Woodward, cochairmen of the Hospitals Division.

The total represents purchases by hospital personnel, board members, and a few patients, and also some institutional purchases. The hospitals continued their campaign during the rest of the

month.

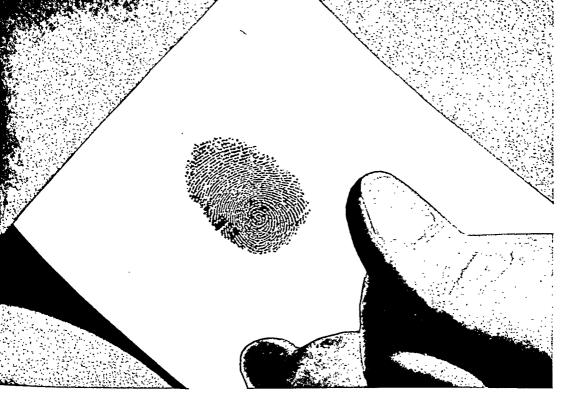

Beekman Hospital headed the list, with a total of \$601,014. Other leaders, in order of total sales to February 17, follow: Presbyterian Hospital, \$470,800; Mt. Sinai Hospital, \$229,425; New York Orthopaedic Dispensary and Hospital, \$178,600; Jewish Memorial Hospital, \$165,954; New York Polyclinic, \$148,997; New York Infirmary for Women and Children, \$129,925, and New York Hospital, \$115,035.

A check for more than \$100, proceeds from a recent scrap paper drive in Sector 8 of Utica, was presented to Col. A. J. Canning, commander of Rhoads General Hospital, by John Douglas, Sector 8 warden, on February 10.

The check will go into the Rhoads General Hospital civilian donation fund, to be used for the purchase of a public address system. The public

An interesting bit of news has just been received by the Journal from Headquarters of the European Theater of Operations of the U.S. Army. When Maj. William J. Hochbaum, of New York City, a medical officer of a United States evacuation hospitalist of the Company of the pital in England, entered a United States station hospital in the vicinity of his unit, he found in charge

an old friend and former teacher, Col. Joseph Haas,

of Brooklyn.

Major Hochbaum served his internship at Mt. Sinai Hospital in New York fifteen years ago. Colonel Haas was on that hospital staff then and he is still a member.

The Army evacuation hospital arrived not long ago at its present location and the major, bothered with a respiratory infection, entered the nearby station hospital. Treated for his ailment and ready to return to duty, he was surprised to find that the commanding officer of the big Army medical installation was the same man he knew long ago.

Duties of Major Hochbaum in the evacuation hospital include maxillofacial surgery and surgery of the eye, ear, nose, and throat. He was chief of service at the Riverside Hospital and associate in otolaryngology at the New York Post-Graduate Hospital and the Hospital for Joint Diseases.

Major Hochbaum entered service in August, 1942. Originally attached to an Air Corps unit, he has been on the staff of the evacuation hospital for most of his tour of military service, participating in the unit organization and training in Massachusetts and Virginia.

He took an intensive course in field medical serv-

ice at Carlisle Barracks, Pennsylvania.

The major graduated from Columbia University College of Physicians and Surgeons in 1927. He taught physiology at the college for one year and interned at Mt. Sinai for two and one-half years, following this with a residency in otolaryngology at Mt. Sinai for another two years. It was during this period that he became acquainted with Colonel Haas, a member of the board and a member of the staff of Mt. Sinai for eighteen years.

Nurses' aides who catch early morning ferries to Halloran Hospital on Staten Island in the future will have six emergency beds to permit them, when possible, to spend the night at the Hospital when

they have two consecutive days of active service.
The plan was announced by Mrs. Frederic de Rham, chairman of the Halloran Hospital aides' unit. Few of the thirty-five volunteers live on Staten Island.\*

Volunteer members of the staff of St. Luke's Hospital in New York City have contributed a total of 38,000 hours of service during the past year. Originally limited to women only, this service now enlists men, who work as orderlies and elevator operators, while Boy Scouts serve as messengers and cafeteria aids.

The affiliation of Yonkers General Hospital with the Wagner College Central School of Nursing, Staten Island, has been announced by Dr. Clarence

C. Stoughton, president of the college. Yonkers General is the fourth hospital to join with Wagner College in the Central School of Nursing program. The other hospitals are Richmond Memorial Hospital, Staten Island Hospital, and Sea View Hospital, all on Staten Island.

Details of the participation are being worked out by Charles E. Crost, superintendent, and Miss Florence Nickok, director of nursing, of the Yonkers, Hospital, with Miss Mary D. Burr, director of nursing at Wagner College.

The new central nursing school, the first of its kind in New York City, was opened last September with an enrollment of 55 students. The second class, in which 40 were admitted, began in Febru-

All of the young women in the nursing school are members of the U.S. Cadet Nurse Corps. They receive nine months of theoretic training in the sciences and nursing arts at the college, following which they will be sent to any one of the four affiliated hospitals for two years of practical work. They will then be eligible to take the state examination for certificates as registered nurses.

At the termination of the war emergency period the registered nurses will be allowed to return to Wagner College for a fourth year of study as candidates for

bachelor of science degrees.

The school has the approval of the State Department of Nursing and the New York State Nursing Council for War Service.\*

The Army Medical School at Walter Reed General Hospital marked its fiftieth anniversary December 19 with the graduation of the class in military and tropical medicine, the sixteenth since August, 1941.

Col. Richard P. Strong, director of tropical disease at the school, bestowed certificates on 124 graduates who included officers of the armies of the United States, Canada, and Peru. The graduation address was given by Maj. Gen. Norman Kirk.—Modern Hospital

The Schenectady Gazette of January 10 carried the following editorial entitled "A Community Institution":

The report that Glenridge Sanatorium, the Schenectady county tuberculosis hospital, has been recommended as a model of a good medium-sized sanatorium to a congress of representatives of five Latin American nations should be a source of pride to all residents of the county who contribute to the support of the local institution through annual taxes. It is also a tribute to Dr. James M. Blake, administrator; Dr. Walter Lawrence, and Dr. Victor Montoya, assistant physiciana, and the whole staff of the sanatorium.

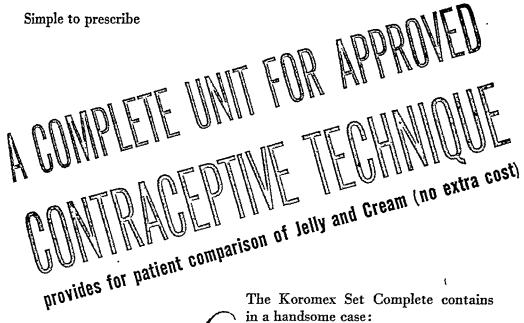

The fact that the medical director of Bolivar Hospital in Caracas, Venezuela, Dr. R. Soules Baldo, selected Glenridge as a model after a seven month tour of the United States, during which time he visited several other institutions, adds during which time he visited several other institutions, adds further the summer of the countries through such ties between the scientific men of the countries of the western hemisphere that the "good neighbor" policy of the western hemisphere that the "good neighbor" policy of the western kemisphere that the "good neighbor" policy of the seasone just as important as the legal and economic ties which are stressed so much today.

Further strengthening these ties was the adoption of the National Tuberculosis Association's system of classification for the disease. Dr. Montoya offered a resolution urging the for the disease. Dr. Montoya offered a resolution urging the proved for official use in Venezuela. The system is used proved for official use in Venezuela. The system is used proved for official use in Venezuela. The system is used proved for official use in twentern hemisphere.

Five Nassau hospitals recently received checks for \$2,513.18 each, the gift of New York racing and representing part of the profits from the nine-day Victory meeting at Jamaica race track, November 4-13.

The hospitals receiving the gifts were Nassau, North Country Community, South Nassau Communities, Long Beach, and Mercy. A total of \$628,294.57 was distributed to charitable agencies by the committee in charge.

Representatives of the various hospitals attended the presentation ceremonies at the River Club,

New York City.\*

An Eric County Division of the Practical Nurses of New York, Inc., was organized in December.

The Erie group is the eighth active division of the State Association operating in New York. Other divisions cover Greater New York, Westchester, Dutchess County, Albany, Broome County, Rochester, Schenectady, and Rensselaer.\*

The Benedictine Hospital, Kingston, is the chief beneficiary of the estate left by the late Mrs. Katherine R. Elting, of Kingston. It is estimated that the institution will receive about \$125,000 under Mrs. Elting's will.\*

#### LEAD POISONING AND BENJAMIN FRANKLIN

In December, a report of the Committee on Lead Poisoning of the Industrial Hygiene Section was published. "Occupational Lead Exposure and Lead Poisoning," it is titled, and, according to the Lead Industries Association and other reviewers, "thoroughly summarizes present-day knowledge" in regard to the recognition, control, diagnosis, and treatment of industrial lead poisoning. Present-day knowledge adds up to quite a lot, even to the conclusion that "recovery from lead poisoning is usually complete, leaving no partial or complete disability," and reminds us that this generation again is the beneficiary of centuries of patient observation, deduction, and reasoning fused into another weapon for our use in preventing and alleviating human misery.

Benjamin Franklin was a pioneer in the diagnosis of lead poisoning. In 1768, he wrote to Cadwallader Evans that he had long believed the disease to be due "to a metallic cause only; observing that it af-

fects, among tradesmen, those that use lead, however different their trades; as glaziers, letter founders, plumbers, potters, white-lead makers, and painters." Drawing on his own background as a printer, Franklin expressed in another letter the belief that lead poisoning among typesetters was due to the particles of metal swallowed with their food by slovenly workers who ate their meals without washing their hands. "The presence of vapors, or fumes, or fine dust of lead compounds in the air breathed by workmen is the most important factor in occupational lead, exposure" says the new report, "however, lead compounds which contaminate the hands, food, tobacco, or other objects taken into the mouth, may not be ignored as means of exposure, even though the conditions be such that these compounds are not disseminated into the air breathed by men."—From "Credit Lines" in Am. J. Pub. Health

### COLLOIDAL IRON

### IONIZABLE IRON

### In Anemia of PREGNANCY

THE prophylaxis and treatment of anemia of pregnancy poses a special problem because of the instability of the alimentary tract in gravid women. In the solution of this problem, the intrinsic advantages of colloidal iron over ionizable iron salts (sulphates, citrates, etc.) is of major significance. In the stomach, the iron salts ionize into iron and acidic ions likely to be astringent and irritating. This is true regardless of whether the salts are in pure form, in masked solution or in coated tablets. In the alkaline intestine, the salts form precipitates which are dehydrating, constipating, and not easily assimilated.

But these things cannot happen with OVO-

FERRIN, for OVOFERRIN is colloidal iron. It is not in ionic form. It is little affected by the gastric juice. It remains stable and cannot irritate. It cannot constipate for it reaches the intestine as a fully hydrated colloid—a form in which nutriment is readily absorbed. For these reasons physicians have come to regard OVOFERRIN as the ideal hematinic in pregnancy. For these reasons also, OVOFERRIN has achieved a reputation as "The Rapid Blood Builder" in secondary anemia, convalescence, anemia of children, and rundown states. Its palatability and high assimilability assure patient co-operation and better results.

#### Crabtree Appointed Acting Chief of Health Division of UNRRA

Herbert H. Lehman, Director General of the United Nations Relief and Rehabilitation Administration, recently announced the appointment of Dr. James A. Crabtree as acting chief of the Health

Division of UNRRA.

Dr. Crabtree graduated from the University of Tennessee School of Medicine, Memphis, in 1925 and took postgraduate work in public health at Johns Hopkins University School of Hygiene and Public Health, Baltimore. He was associated with the Tennessee Department of Public Health until 1934, when he became assistant director of health and safety for the Tennessee Valley Authority. Since 1938, Dr. Crabtree has been in the Com-missioned Corps of the U.S. Public Health Service. In June, 1940, he became executive assistant to the Surgeon General, U.S. Public Health Service, and from March, 1941, to April, 1943, was assigned to the Office of Defense Health and Welfare Services as executive secretary of the Health and Medical Committee, serving also from July, 1942, to April, 1943, as medical consultant to the Office of Lend-Lease Administration. He has served as chief medical officer of the Office of Foreign Relief and Rehabilitation Operations since April 1, 1943.-J.A.M.A.

#### Cannon Appointed to Committee on Maternal and Child Health Services

Dr. George D. Cannon has been appointed to the Children's Bureau Advisory Committee on Maternal and Child Health Services. The following New York City members of the Bureau's Commission on Children in Wartime have also been appointed to the Advisory Committee, ex offico: Drs. Leona Baumgartner and Reginald M. Atwater.

#### Good Neighbor Policy in Medical Training

Under an agreement with the Coordinator of Under an agreement with the Coordinator of Inter-American Affairs providing training facilities for medical Fellows from Latin America, Dr. Augusto Carlos Mallorquin of Paraquay, Dr. José Francisco Valiente, of El Salvador, central America, have been assigned to the Division of Tuberculosis of the New York State Department of Health for a period of approximately six months to study tuberculosis control. Both Dr. Mallorquin and Dr. Valiente began their training the latter part of October, the former at the Homer latter part of October, the former at the Homer Folks Tuberculosis Hospital in Oneonta and the latter at the Mount Morris Tuberculosis Hospital in Mount Morris.

Dr. Mallorquin is director of the Tuberculosis Dispensary in Asunción and, on completion of his studies in the United States, will be associated with the new tuberculosis sanatorium which is being constructed under the field program of the Health and Sanitation Division of the Institute of Inter-Ameri-

Dr. Valiente has been specializing in tuberculosis can Affairs.

work in Rosales Hospital and the National Sana-torium at Los Planes. He is assistant superintendent at the latter institution.

It is the intention of the Coordinator of Inter-American Affairs to refer additional physicians from Central and South American countries to the Division of Tuberculosis for training,—Health News

#### Bristol is Chairman of Health Advisory Council

Eric A. Johnston, president of the Chamber of Commerce of the United States, has announced the appointments of Dr. Leverett D. Bristol, executive director of the Hospital Council of Greater New York, as chairman of the Chamber's Health Advisory Council, and of Dr. Anthony J. Lanza, chief of the Occupational Hygiene Section of the Office of the Surgeon General, A.U.S., as chairman of the Council's Committee on Industrial Health. Dr. Bristol succeeds Dr. James S. McLester, of Birmingham, Alabama.

In discussing the work of the Advisory Council, which operates with the Chamber's Insurance Department in advising business organizations throughout the country on industrial, individual, and community health. and community health programs and in cooperating with national, state, and local health agencies, Dr.

Bristol said:

"The health of the nation's sixty million wage earners and war workers of every kind and type is vitally important to the war effort. In the last quarter of a century the hygiene of American industry has made notable progress, commensurate perhaps with that made by production itself. Many American industries have attained an undivisions surpassed standard of healthful working conditions and of industrial health service. This achievement, however, carries with it the tendency to overlook the fact that the great majority of American wage earners are employed in small establishments-those employing 500 or less. The rank and file of such industries are still a long way from providing for all the health service that has come to be regarded as normal and proper where a number of wage

earners are assembled under one management.

"I believe that the National Chamber's Health Advisory Council . . . should place special emphasis on the health of workers in industry, particularly in the smaller plants, few of which, at present, make adequate provision for the medical supervision and care which is so essential to mainsupervision and care which is so essential to maintaining full productive capacity."

Dr. Bristol is a graduate in medicine of Johns Hopkins University and holds a degree in public health from Harvard. He was one of the pioneers in the field of industrial health and is a recognized authority in this field.

Dr. McLester, chairman of the Council from its authority in this field inception, has found it necessary to resign the general chairmanship because of additional responsibilities placed on him by the Federal Government in connection with its war nutrition program and by Governor Sparks of Alabama in connection with the development of a four-year medical school for that state.

#### [Continued from page 648]

The basic objective of the Health Council is to enhance the nation's human resources-and hence its productive efficiency—through prevention and reduction of illness and accidents and by increasing the physical fitness and well-being of its citizens. The Council seeks to distribute and make effective in all groups at the community level the health knowledge which is already available, and to stimulate and secure the support of business men and laymen for national, state, and community health programs. The work of the Chamber in cooperation with the American Public Health Association for the last fifteen years, in evaluating local health activities and needs through the National Health Honor Roll, is thus expanded and broadened in scope.

Dr. Anthony Lanza, chief of the Occupational Hygiene Section of the Office of the Surgeon General, U.S. Army, succeeds Dr. Bristol as chairman of the Chamber's Committee on Industrial Health. He has been active in the field of industrial hygiene

for the last twenty-five years.

#### Malaria, Typhus, and Yellow Fever Not Postwar Problems, Says Admiral Stephenson

Malaria, typhus, and yellow fever will not become public health problems in the United States, in the opinion of Rear Admiral Charles S. Stephenson, M.C., U.S.N., who described his experience as organizer of the United States of America Typhus Commission at the New York Tuberculosis and Health Association's Annual Conference on Feb-

Sir Gerald Campbell, G.C.M.G., special assistant to the British Ambassador to the United States, who shared the program with Admiral Stephenson, spoke on "The Health of a Once-Beleaguered Na-In his talk he described the mental and physical welfare of the citizens of England under the stress of war and the tuberculosis prevention

program of the Health Services of Great Britain.

Admiral Stephenson declared: "There is no likelihood that typhus fever will be introduced in the United States, as delousing will be effective with the military population before they leave the areas where they may encounter typhus fever, and all troops will be vaccinated before going into areas

where typhus fever is known to exist."

Regarding malaria, Admiral Stephenson said that it is "perfectly obvious that people who have malaria will return to the United States and it is fair to state that small local outbreaks may occur, but they should be easily brought under control."

Spraying of aircraft flying between the United States and the various areas where yellow fever exists, by government regulation, and the vaccination against yellow fever by travelers all over the world largely reduce any possibility of bringing into this country a person suffering from yellow fever, according to Admiral Stephenson.

"The historical beginning of yellow fever in the United States has been disastrous, and it has been seen as far north as New York City," Admiral Stephenson said. "Nevertheless, in the event of its introduction into this country there is ample vaccine available."

Sessions on tuberculosis were held all day, with the Tuberculosis Sanatorium Conference of Met-ropolitan New York sponsoring the afternoon session. "Tuberculosis on the Home Front,"

"Hospitalization of the Tuberculous," and "Employing the Tuberculous During Wartime" were

topics discussed at the morning conference.

The Social Hygiene Division of the Association rine Social Tygene Division of the Association held six sessions during the day, at which were discussed, among other subjects, "The Effect of Venereal Diseases on Fertility," "How Venereal Disease Affects Family Life," "Scientific Advances in Venereal Disease Treatment," and "Health Education in Relation to Disease Prevention."

"Physical Legislation of Physical Health Psychology"

"Rheumatic Fever as a Public Health Problem" and "The Rheumatic Fever Program of the Children's Bureau" were discussed at the session arranged by the New York Heart Association, a division of the New York Tuberculosis and Health Association.

#### Consultant Service for Nurses in Industry

The Division of Industrial Hygiene, New York State Department of Labor, has established a branch office in Syracuse. Arrangements were made with the Medical College of Syracuse University for office and laboratory space, and the United States Public Health Service has assigned an industrial physician, an engineer, a chemist, and a nurse to work in plants in the upstate area.

With the opening of this office, the services of an industrial nursing consultant were made available to nurses in industry. The purposes of the service are to assist industrial nurses in formulating programs of work, to establish record systems or revise existing ones, and to act as a medium for the exchange of industrial nursing experiences, health education material, and information regarding university courses.

Folders are maintained on industrial records, health pamphlets, and health posters. These are lent on request for a period of one week. Any industrial nurse who wishes to borrow this material should communicate with Miss Margaret J. Nichols, Industrial Nursing Consultant, New York State Department of Labor, 766 Irving Avenue, Syracuse 10, New York.—Health News

#### Talc Mining Presents Industrial Health Problem

The New York State Department of Labor has found that the mining and milling of tremolite talc in New York State presents a definite workers' health problem, Industrial Commissioner Edward Corsi has announced. Industrial hygiene experts of the Department reported to the Commissioner that "exposure to tremolite tale dust must be considered to constitute a definite industrial hazard requiring control of dust by suitable engineering methods."

New York is the leading tale producing state of the nation, Commissioner Corsi pointed out. It is noted for its fibrous tale, known as asbestine. With the fibrous tale is found tremolite, a similarappearing mineral occurring in a fibrous or asbestiform state, which in the course of time changes to

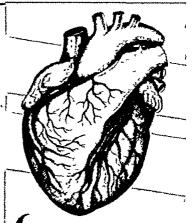

In the New York State tale mining and milling talc. establishments alone there are less than 500 workers, but there are thousands of workers in industries where talc is used as an ingredient of manufactured products who may be exposed to high concentrations of tremolite tale dust. For this reason the State Labor Department's study has wide applica-

tion, Commissioner Corsi said. Recently the high dust concentrations and other hazards to the health and safety of both miners and millers have be-come a subject of grave concern to their labor unions

In the Labor Department's study, operations and dust concentrations in three tremolite talc mines and five mills located in St. Lawrence County were observed and analyzed by engineers of the Division of Industrial Hygiene. Department physicians gave initial x-ray examinations to 221 men from seven plants. In the case of 28 of these men who showed positive lung findings, a follow-up examination, which included a second x-ray, physical examination of the chest, medical history, and detailed occupational history was made at the end of 10 months.

Eighteen of the men showing marked fibrosis were found not to have been engaged in any other dusty industry. Of these, 15 worked in talc mills, three in the mines. Other phases of the study also showed that fibrosis was relatively more prevalent among millers than among miners. With one exception, the men with fibrosis were all 40 years of

age or older and had been exposed to tale dust for at least ten years. Thirteen of the 18 had one or more symptoms referrable to the lungs. The group showing fibrosis presented an undernourished and drawn appearance.

In the total group of 221 talc workers, 29 showed primary healed tuberculosis, six, healed reinfection type tuberculosis, and five, clinically significant tuberculosis. The incidence of clinically significant tuberculosis (2.2 per cent) was slightly higher than the average (about 1.2 per cent) found in most industrial groups. Among the 18 cases of fibrosis in those exposed only to talc dust, however, clinically significant tuberculosis appeared to be a

complicating feature in three cases—16.6 per cent. Remedial procedure in the control of tremolite talc dust has been taken under existing industrial code rules, Commissioner Corsi said, and the study of tale hazards has been extended to those industries where tale is used as an ingredient in the products manufactured. If existing code rules are found inadequate to complete control of the hazard, Commissioner Corsi added, they will be revised or new rules recommended which will meet the

requirements.

#### DOCTOR AND PATIENT

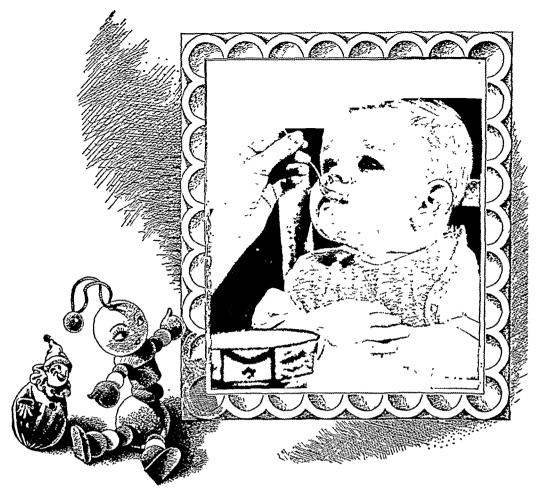

It is a common complaint against the hospitals that patients are not told enough about their illnesses and that there is almost a conspiracy on the part of doctors and hospital authorities. What the psychologist solls (the psychologist solls) (the p gist calls "channels of communication" become increasingly important and at the same time harder to keep open as an organization grows in size and complexity. In fact, communications can be maintained only by persistent and conscious endeavour. A patient attends a hospital for treatment of an inguinal hernia and is found, to his misfortune to have some lesion of which he was wholly unaware, such as coarctation of the aorta or an early Paget's dis-

Before he knows where he is, he is an inmate of a medical ward and is submitted to investigations that have no obvious relevance to his complaint. Finally he is discharged, still with his hernia and naturally disgruntled. Students and housemen need a frequent reminder that they should on no account let a patient out of a hospital without making sure that they know what he actually came in for and whether he is satisfied. They should also realize that—with the growth of contributory schemes and payments for services rendered on the one hand, and, on the other, the subvention of medical education by Government grants, research funds, and hospital facilities-it is more appropriate to look upon the medical student as the recipient of charity than the patient. Most consultants would confess that they learn more from their private patients than from their hospital patients. This is often put down to the superior intelligence of the former. Nevertheless, other factors such as expenditure of time and psychological attitude are different, and the student should be taught that the nearer he can get to the private patient relationship in studying his hospital patients the more he will learn about his art. It is unfortunate that so many medical students have to be trained in large cities such as London, where teaching hospitals have less local responsibility than in smaller cities and where the spirit of an old-established charity still haunts the wards. a better discipline in the relationship of hospital,

doctor, and patient if they work in a small provincial centre-particularly if they regard the local weekly paper as one of their most important texts. What happens in the hospital is not merely news: it is a major interest of the community. In such a centre the student will learn most rapidly the unwisdom of operating on advanced malignant disease or of carrying out risky diagnostic procedures unless he has made certain that the patient and the relatives fully realize and accept the position. It is easy to be thoughtless of the individual when medicine is organized on the lines of quantity production, as it is in large hospitals and in industrial establishments. And care must be taken that no bafflement or disillusion of the individual taints the health centres and unit hospitals which make such a brave

showing in pictures of the future.

The industrial medical officer obviously runs the risk of working across the grain rather than with it in his dealings with the worker. He is peculiarly liable to be affiliated with "they" and "them," those paranoid fantasies on which we all vent our spleen-and will continue to do so whatever "ism" we live under. Just as the primary interest of the hospital doctor is diagnosis, so the primary interest of the factory doctor is maintenance of a low sickness rate. In the one case patients tend to become "clinical material," in the other they become "labour, unless we are always mindful of our professional fail-Yet the industrial medical officer is often justified in his complaints against the private practitioner. One of the main purposes of doctors is to keep people at work, both for their patients' sake and for the sake of the country. It is very wrong, therefore, for a private practitioner to attribute banal symptoms to industrial processes of which he knows nothing, to give long holidays for trivial male addies or to dealers. adies, or to declare a worker unfit for a particular job on eleemosynary rather than scientific grounds. Medicine has a duty to both the individual and the community, and, whatever state of society we live under, we can never be absolved from the task of bringing harmony between them.—Brilish M. J., F.b. 5, 1944

## Just like his Grandpa-

—a hearty scooper-upper of Cream Farina

THE first year in the life of Heckers' Cream Farina saw the United States declare war. But it was no war you remember. It was the Mexican War of 1846.

Even then, the doctors and the observant scientific men of that day gave widespread approval to it. They were quick to see how easily digested it was, how nourishing, how quickly it was assimilated.

Today, Heckers' Cream Farina goes marching right on into the homes and hearts of families everywhere. And it is even better for

the modern baby than it was for Grandpa. Because it is now scientifically enriched with Vitamin B<sub>1</sub>, niacin and nutritional iron.

Herkimer. Mrs. Byron G. Shults, president, and Mrs. Harold Buckbee, State Historian, attended the State Executive Board meeting. Dr. Joseph Lawrence addressed the medical society. The meeting was held at the Mohawk Valley County Club. Dr. Lawrence criticized provisions of the Wagner-Murray-Dingell Bill. Dr. Lawrence stated that the bill should not be enacted. The meeting

Mrs. Frances Hoffman gave a report on the Wagner-Murray Bill at a meeting of the American

Legion Auxiliary.

On April 15, at the Mohawk Valley Country Club, the fourth anniversary of the auxiliary will be celebrated. Mrs. John Canfield was named chairman, to be assisted by Mrs. Albert L. Fagan, Mrs. Fred Sabin, Mrs. H. F. Morey, and Mrs. Harold F. Buckbee. Members of the medical society will be invited to this meeting. The auxiliary is helping Miss Mildred Kunes, local librarian, to furnish books and magazines for the Herkimer Memorial Hospital.

Niagara. A meeting was held at the Prospect House. Luncheon was served. Mrs. John Kinzly presided at the meeting, which followed the lunch-eon. Dr. Grant Guillemont and Dr. Richard Sherwood of Niagara Falls were the speakers of the afternoon, their subject being the Wagner-Murray-

Dingell Bill.

Rensselaer. Dr. Joseph Lawrence was the guest speaker at a membership tea and guest meeting. The meeting was held at the Hendrick Hudson. Mrs. John J. Noonan and Mrs. Augustus J. Hambrook presided at the tea table. Mrs. Warren St.

John was the chairman.

Saratoga. At a meeting of the auxiliary Dr. Helen Hosmer, assistant physician at the Homestead Sanatorium, told of her experiences with the Grenfell Mission. Sir Wilfred, a widely known sportsman, financed the project while in Labrador to enjoy sports, starting the mission by giving medical aid. He used his own boat, which he transformed into a hospital ship, to ply up and down the coast administering aid. The difficulty of operating in a country where there were no roads and travel was by boats and dog team, and many other inter-

esting features of the Mission were related by Dr. Hosmer. Mrs. James J. McNaughton reviewed legislative matters, asking all members to write to senators and congressmen.

The auxiliary members were guests of the county medical society, at the Gudion Putnam. Dr. Joseph S. Lawrence was the speaker. Dr. Lawrence's talk was on legislative aspects of medi-

Mrs. G. Frederick Goodfellow and Mrs. Malcolm J. Magovern were hostesses for the social hour.

Schenectady. Dr. Joseph S. Lawrence spoke at Old Chapel, Union College, under the auspices of the auxiliary. Mrs. Milton Gipstein was in charge of the meeting. Labor, civic, fraternal, and professional groups were invited to attend. A Christmas tea was held at the home of Mrs. Isaac Shapiro. Presiding at the tea table were Mrs. F. Leslie Sullivan, State President, Mrs. Herman Galster, Mrs. Albert Greene, and Mrs. William Mallia. A Christmas program was presented by James Smith, Sara Linn Blake, Sandra Smith, Rollin Galster, Ann Constance Penta, Gail Von Borstel, Eleanor Shapiro, Barry Gipstein, Roland Faulkner, Gerardus Jameson, Joseph Loffredo, Albert Loffredo, and Patty Duncan (these are the coming medical society and auxiliary members). Mrs. Albert Grussner invited members of the auxiliary to visit the Child Care Centers. Mrs. Milton Gipstein extended an invitation to the members to hear Miss Jane Evans of Cincinnati and New York, executive director of Temple Sisterhoods of the National Federation.

Mrs. W. Howard Pillsbury spoke to the auxiliary on the difficulties confronting every nation after the war. The problem of "Children in a World at War" was the main topic. Mrs. Pillsbury explained that bombings in themselves have not done so much damage to the future development of world citizens as the disrupting of homes. Parents and children have been torn apart, and the methods and customs of foster parents have estranged both children and parents. When these families are reunited, friction is bound to occur, she said. Hatred which is being instilled in everyone is necessary to win a war, but it cannot be shut off immediately following the peace. There is a delicate balance between duty to the war and building postwar citizens. Child Care Centers are valuable in this respect since they tend to direct the energies of respect, since they tend to direct the energies of children into constructive instead of destructive The movie which was shown at the meeting, "Children of Working Mothers," depicted this development, Mrs. Pillsbury stated.

The Annual Convention-May 8-11, at the Hotel Pennsylvania, New York City.

Aristotle, the ancient Greek philosopher, advised over 2,000 years ago the eating of liver to prevent night blindness.-Minnesota Medicine

### "A PLACE FOR EVERY TOE AND EVERY TOE IN PLACE"

... a fundamental rule for any footwear construction.

But an orthopedic shoe must be built for more than that in order to prevent or correct foot troubles and deformities. It must follow the pattern of nature as closely as possible to permit proper position and action of every bone and muscle—to allow perfect circulation, correct joint articulation and help strengthen sustaining muscles. It must shift the weight of the body from the arches to the proper "weightbearing" surfaces and help the doctor's own treatments.

Whether the need is preventive or therapeutic, you will find the right qualities in Pediforme shoes. Many years of continuous service to members of the medical profession authenticates that point.

#### Tuberculosis Abstracts

### The Family Doctor, the Patient, and the Job

The private physician who has guided his patient through recovery from pulmonary tuberculosis is now being asked frequently to advise concerning some job which that patient may attempt without too great hazard. In this general manpower shortage, the patient with inactive tuberculosis, whether from civilian life, from induction centers, or discharged from military services, can find employment readily in many localities, particularly if he has an established skill. Beside that economic need which makes many patients reluctant to continue treatment for the prescribed period, patients now are moved by the wish to become a part of the war effort and sometimes by high wages. Some employers who hire all comers are unlikely to establish any safeguards for handicapped workers.

One of the physician's paramount difficulties has been the item of sufficiently definite information about the job in question. Jobs are changing rapidly.' The exhausting task of a year ago has been reduced to machine-tending. Redesign, retooling, reorganization, rerouting, continue to make more specifications obsolete. Keeping up with such rapid and drastic change is impossible for any physician or lay worker without current sources of industrial information. Some physicians have sought to bridge this difficulty by such general terms as "light work," hoping thereby to protect the patient from excessive exertion, strain, and tension. Unfortunately, employers' requirements are definite. Employment placement interviewers must meet these definite requirements. A patient's ability to do "light work" is indefinite and unsaleable.

But there are now official and unofficial sources of information through which physician and patient may usually find definite indications concerning which job is free from undesirable hazards. The official services include the United States Employment Service, which has branch offices in most population centers, and the State Vocational Rehabilitation Services. The United States Employment Service has the most complete and currently accurate information on what jobs there are in each community and on what physical performance is required in each job. It has originated a "Physical Demands Form," which is being used experimentally to determine required physical activity and working conditions. This type of job analysis explores especially such items as continuous standing, sitting, lifting, stooping, etc. One purpose of this informa-tion is to check the specific requirements of the job against the specific limitations of the handicapped applicant.

Interested physicians may obtain copies of interim physical requirement forms from the National Tuberculosis Association. The larger offices of the U.S.E.S. also include executives or interviewers who have some experience in special placements and who are qualified to discuss the subject of suitable placement for recovered patients with their physicians. The U.S.E.S. has placed thousands of inactive tuberculous patients in hundreds of different jobs. The suitability of these placements has depended most of the time on the quality and quantity of medical information available.

When the recovered tuberculous patient has no marketable skill, or when his old job is contra-

indicated medically, application for training or retraining and placement should be made to the State Bureau of Vocational Rehabilitation. Financed by State appropriations and Federal matching funds, these Bureaus are empowered to impart specific vocational training and placement to handicapped adults in order to make them self-supporting.

The physician will find in Federal Form R-3a (revised), published by the Federal Vocational Rehabilitation Bureau and in the manual prepared for its interpretation (Misc. 2328) practical bases upon which rehabilitation agent and physician may cohere their services for the patient.\* The form and the manual are the result of many consultations between Federal rehabilitation personnel and members of the Council of the American Trudeau Society and other phthisiologists of long experience. Many state agents and supervisors have learned that, as the Federal manual points out, direct interview between physician and rehabilitation worker is the most satisfactory procedure for both.

A number of the state and local tuberculosis associations have included rehabilitation in their program objectives. Some have employed special personnel competent to assist the patient in finding his way to appropriate training or placement or both. Rehabilitation workers employed by voluntary agencies are well aware that the patients of private physicians may have as much need for their services as the sanatorium graduate. The physician may find it well worth while to inquire from the nearest tuberculosis association what it has to offer in the direction of rehabilitation.

Both official and voluntary resources have been stimulated and encouraged by changing attitudes within industry. Not manpower shortage alone, but a cumulation of satisfactory performance by former patients, has done much to improve this

situation.

The nation's leading personnel agency, the United States Civil Service Commission, has conducted surveys of jobs in several types of Federal services and in war-contract industries in search of jobs suitable for physically handicapped persons. Prospective employment for persons with a history of

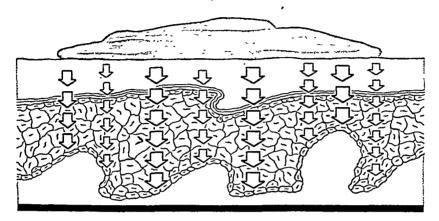

tuberculosis has been conspicuously included.

This precedent has been matched by action on the part of the National Association of Manufacturers. In the December, 1942, supplement of its Industrial Relations Bulletin, the N.A.M. indicated that various handicapped groups are a new labor source. Specific mention is made of employees who have suffered amputations, deafness, blindness, organic heart diseases, and tuberculosis. For each group, a partial list of suggested jobs is offered. The bulletin indicates that one of the parallel practices in employing handicapped workers, calls for "careful selectivity in applying the handicapped man to a job which he can do." Again the private physician and the industrial doctor are able to provide medical advice and counsel. A number of large employers have recently utilized the specific job-analysis method developed by the United States Employment Service, described above.

\*Available from the Vocational Rehabilitation Bureau Federal Security Agency, Washington, D.C., or through tuberculosis associations.

## MEDICATION & INFILTRATION

For prolonged, effective decongestion and analyssia in local inflammatory conditions, Numotizine's mode of action is outstanding.

By infiltration through the emplastrum and through the epidermal and dermal layers, the guaiacol, beechwood creosote and methyl salicylate are slowly absorbed, and thereby produce both local and systemic therapeutic effects. Numotizine exerts its effectiveness gradually and steadily over a period of eight

MIN M TITIM C THE PRESCRIPTION CATAPLASM IN U. W. U. I. L. I. N. L.

hours or more.

Numotizine is clean and simple to use—it replaces the inconvenient, older methods of applying "ex-heat"—thus eliminating need for constant attention.

Indicated in chest conditions, sprains, neuralgias, strains, epididymitis, superficial abscesses,

myalgia, neuritis and similar conditions.

4-oz., 8-oz., 15-oz. and 30-oz. jars

#### SOCIAL AND HEALTH BUREAUS RECEIVE 59,000 INQUIRIES

Fourteen organized information bureaus in New York City answered 59,252 inquiries about the city's social and health services in 1943, Robert P. Lane, Executive Director of the Welfare Council of New York City, reported last week. His report was based on a statistical survey prepared by the Central Reporting Service of the Council.

The largest number of inquiries, 37,383, asked for referral to some specific social service, including those for health, medical, and welfare service, care of the aged, child care, recreational and vacation resources, and educational facilities.

"The fact that over a thousand inquiries a week are made of organized information bureaus in New York City is to some extent a reflection of the com-plexities introduced by the war," Mr. Lane said in releasing the figures. "In the Welfare Council's own Information Bureau, for example, there has been a considerable volume of inquiries prompted by problems of civilian dislocation, the glamor of war industry boom-town wages, the departure of family men for war services, the dazzling effect of the uniform on the susceptible adolescent, the shortage of medical and nursing facilities, and other complica-

tions arising from the war.
"The organized information bureaus in the welfare and health fields have established and maintained close contacts with the dozens of war information services set up by governmental and quasi governmental bodies in connection with rationing, civilian defense, volunteer work, facilities for men and women in the armed forces, consumer services, etc. These have proved mutually rewarding."

The largest number of requests received by any bureau during the year came to the Welfare Coun-

Out of a total of 12,513 inquiries, 8,221 were handled by the Information Bureau and 4,292 by the Council's Contributors Information Bureau, which makes confidential reports on local welfare and health agencies appealing to the public for fi-

nancial support.

The other thirteen agencies reporting, and the number of inquiries made of each, are: New York Tuberculosis and Health Association (including its Bronx and Harlem committees), 8,980; Catholic Charities of the Archdiocese of New York (Manhattan, Bronx, and Richmond offices), 6,927; Children's Welfare Federation, 6,914; New York League for the Hard of Hearing, 5,407; Legal Aid Society, 3,185; Federation for the Support of Jewish Philanders of the Support of Tewish Philanders of the S thropic Societies, 2,846; New York City Cancer Committee, 2,705; Catholic Charities of the Diocese of Brooklyn, 1,565; Citizens' Housing Council of New York, 1,511; New York City Committee on Mental Hygiene, 894; Public Education Association, 648; and Vocational Service for Juniors, 581.

About two-thirds of the inquiries were made by telephone, the figures released by Mr. Lane show. The remaining third was equally divided between personal visits and letters. The inquirers include not only individuals needing information for personal visits and letters. use, but social agencies, schools, welfare departments of business organizations and trade unions, and professional people inquiring on behalf of clients.-

Better Times

#### FRANKLIN ON COLDS

Franklin's theories on the causes and cures for the common cold are essentially the sum total of what anyone today knows about that commonplace and most widespread of diseases.

Even though he could never have heard of germs or virus, Franklin deduced that colds were carried by "particular effluvia in the air." He also believed

· that colds were contagious.

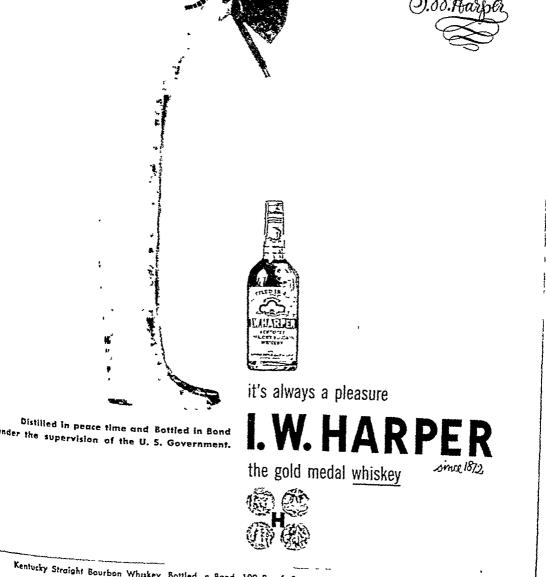

His theory maintained that colds were spread by crowds gathered in unventilated quarters and breathing foul, stagnant air. His theories on air conditioning were developed as a corollary to this observation.

In illustrating how colds may be prevented, Franklin advised frequent bathing (in an era when baths were regarded as unwholesome), regular physical exercise, sound diet, and fresh air ......

Not only was Franklin preoccupied with the cause and prevention of the common cold, but he dabbled in pharmacy to devise a treatment for it. When Samuel Johnson was stricken with "the fever and ague," Franklin advised him, in a letter dated September 13, 1750, not to "omit the use of bark too soon.'

He also added, "Remember to take preventing doses faithfully . . . If you take the powder mixed quick in a ten cup of milk, 'tis not disagreeable, but looks and even tastes like choco-

late.
"Tis an old saying: That an ounce of prevention is worth a pound of cure,—and certainly a true one, with regard to the bark."—From Benjamin Franklin's Contributions to Medical Science, prepared by the National Franklin Committee of Philadelphia

#### REVIEWED

An Atlas of Anatomy. By J. C. Boileau Grant. Vol. 1, Upper Limb, Abdomen, Perineum, Pelvis and Lower Limb. Quarto of 214 pages, illustrated. Baltimore, Williams & Wilkins Co., 1943. Cloth.

\$5.00. Although perforce part of the material covered by this book appears in other well-known atlases of this kind, there are certain features of this one that

merit special attention and comment. They are (1) the successful attempt to simplify reproductions so that essential features stand out prominently; (2) the elimination of distortion which occurs in photographic reproduction and results in lack of proper proportion; and (3) the making of legends concise yet comprehensive.

It is an admirable work and should be a valuable addition to the anatomic library of the medical student, teacher, physician, and surgeon.

WALTER H. SCHMITT.

Oral Diagnosis. By Kurt H. Thoma, D.M.D. Second edition, revised. Octave of 495 pages, illustrated. Philadelphia, W. B. Saunders Co., 1943. Cloth, \$6.75.

This book is o reviewer has seen in many a day. Principles allumethods of examination and diagnosis are covered in an exhaustive manner, with complete informa-tion on all phases, including general physical examination and special examination for dental and oral disease. Treatment planning, diet, and medication are outlined. The book is well illustrated with many fine color illustrations demonstrating pathologic conditions of the oral mucosa, lips and tongue. This is the most comprehensive work of its kind that it has been our pleasure to examine and we would recommend it for the library of all dentists.

LAWRENCE J. DUNN

Frontiers in Cytochemistry. Edited by Normand L. Hoerr, Professor of Anatomy, School of Medicine, Western Reserve University. (Forms Vol. X of "Biological Symposia," a series of volumes devoted to current symposiums in the field of Biology.) Octavo of 334 pages, illustrated. Lancaster, Pa., Jaques Cattell Press, 1943. Cloth, \$3.50.

This symposium consists of thirteen papers written by former students of Dr. R. R. Bensley, professor emeritus of anatomy of the University of Chicago, in honor of Professor Bensley on his seventy-fifth birthday. It also contains a tribute

to Dr. Bensley and a paper by him.

Each article is an up-to-date presentation of some phase of cytologic and cytochemical investigations. Due to the impetus given by Dr. Bensley, cytochemistry has advanced tremendously in recent years. These papers include data on the anatomy, physiology, chemistry, and pathology of the living cell. This text is an important contribution to our knowledge of the subject.

MATTHEW STEEL

Introduction to Physiological and Pathological Chemistry. With Laboratory Experiments. By L. Earle Arnow, M.D. Second edition. Octavo of 574 pages, illustrated. St. Louis, C. V. Mosby Co., 1943. Cloth, \$3.75.

An excellent, well-arranged, and inclusive text that will be most helpful to students of the nursing profession. The theoretic and practical features of chemistry and biochemistry are well blended with clinicochemical methods and pathology. Of course, the subject matter is not so intensive as that undertaken by a medical student, but it follows the same trend of development, and therefore will make the nurse an intelligent chemical cooperator with the physician. It is one of the best texts on the subject.

MATTHEW STEEL

The Nature and Treatment of Mental Disorders. By Dom Thomas Verner Moore, M.D. Octavo of 312 pages. New York, Grune & Stratton, 1943. Cloth, \$4.00.

Father Moore, a priest as well as a psychiatrist, presents this readable volume on clinical psychiatry as an outgrowth of his vast personal experience in this field. The author illustrates the various technics of psychotherapy with well-chosen case reports.

However, the reader will find this book vastly different from the usual textbook on psychiatry in the presentation of the material. New syndromes have been erected which may confuse the reader.

There is an excellent evaluation and criticism of the work of Freud, Jung, Adler, and Alexander which enhances its value.

Of questionable value are the many pages devoted to listing the standard nomenclature of clinical entities in psychiatry.

J. L. ABRAMSON

Clinical Audiometry. By C. C. Bunch, Ph.D. Octavo of 186 pages, illustrated. St. Louis, C. V. Mosby Co., 1943. Cloth, \$4.00.

Clinical Audiometry by Bunch is a small, practical, informative book. Twenty-five years of study, [Continued on page 666]

An extra instrument for your overburdened hands

If one out of every three physicians is called to the colors the men remaining in civilian practice face the profession's most heroic task.

Now, as never before, physicians are entitled to every available aid. Nature created such an adjuvant in the carbonated mineral waters of Saratoga Spa. Around them, under New York State guardianship, facilities were organized for your use.

Many physicians have long recognized the established therapeutic values of the waters in treating conditions where external or internal use of them is indicated. Many physicians realizing that breakdowns in general health follow the heavy strains and pressures of these times, prescribe a stay at the Spa.

Relaxation found in the restful environment of Saratoga brings that relief from tensions which prepares your patients for the full benefit of your continuing medical direction. The Spa Medical Staff does not practice; it only oversees treatments prescribed by you or the local specialist you choose for your patient's stay here.

For professional publications of The Spa, physician's sample carton of the bottled waters with their analyses, please address W. S. McClellan, M. D., Medical Director, Saratoga Spa, 155 Saratoga Springs, N. Y.

Community health, as the name implies, covers n a dozen chapters the various activities of recognized value in a federal, state, municipal, or rural health program.

Alfred E. Shipley

Clinical Laboratory Methods and Diagnosis. A Textbook on Laboratory Procedures with Their Interpretation. By R. B. H. Gradwohl, M.D. Third edition. Vols. I and II. Quarto of 2,130 pages with index of 100 pages; 726 text illustrations and 57 color plates. St. Louis, C. V. Mosby Co, 1943. Cloth, \$20.

The third edition of Clinical Laboratory Methods and Diagnosis has appeared as two large volumes comprising 2,130 pages of text, tables, illustrations, and colored plates. In each volume there are 100 pages of index additionally. The work is a veritable encyclopedia of medical laboratory information liberally illustrated.

In each section are described several technical methods directed toward the same ends. The descriptions are clear, concise, and in great detail. The principles of the methods are explained, and the

interpretations analyzed.

Included in this edition are most detailed considerations of liver function tests, blood grouping, shock, vitamin assay and identification, examination for estrogenic substances and their effects, and virus diseases. The section on tissue cutting and staining has been rewritten by A. A. Krajian. Several authors have contributed to the sections on parasitology, helminthology, and bacteriology. This edition should prove to be of value to both the laboratory technician and the physician.

Max Lederer

Microscopic Technique in Biology and Medicine. By E. V. Cowdry. Octavo of 206 pages. Baltimore, Williams & Wilkins Co., 1943. Cloth, \$4.00.

Cowdry's Microscopic Technique in Biology and Medicine is not a book of minute detail of technic in these branches. It does, however, contain an extraordinary amount of information, much of which is unusual, yet very useful. Between its covers are contained, in a handy reference, everything from absorption spectra to zymogens, their explanation, uses, and application. It is an excellent book for the biologist and medical man in the research and general laboratory fields.

M. EDWARD MARTEN

Symptoms and Signs in Clinical Medicine. An Introduction to Medical Diagnosis. By E. Noble Chamberlain, M.D. Third edition. Octavo of 456 pages, illustrated. Baltimore, Williams & Wilkins Co., 1943. Cloth, \$8.00.

Somewhat delayed by publishing vicissitudes of the war, the third edition of Chamberlain's book, subtitled An Introduction to Medical Diagnosis, has made a welcome appearance. Although a little inferior to two similar American textbooks, it is a sound, practical volume which has served many students well and will continue to do so.

In this edition, Capon's chapter on the examination of sick children and the section on the nervous system may be singled out as of particular excellence. The chapter on clinical pathology has no place in a work of this sort and should have been omitted. The material in the chapter on radiology should more profitably have been scattered throughout the appropriate preceding chapters.

diseased.

#### WHO WILL INHERIT THE EARTH?

Estimates of future populations have been shot to blazes by the guns of war. Revised theories have had to take into account an increased birth-rate (in this country) which began in the middle Nineteen Thirties, the introduction of chemotherapy with its promise of a reduction in mortality, the better showing made in Negro mortality, and the new knowledge of nutrition. But even then, the prediction made some years ago that by the end of the century the population will grow more slowly, then cease to grow and finally decline, is still a safe bet. Sometime in the twenty-first century we shall be an older people, which means social, economic, and political changes.

#### [Continued from page 663]

research, and collaboration by the author in this one field indicate its authoritativeness. Reviewed are all methods of testing hearing and the development and technic of audiometry. Conductive and perceptive deafness are discussed, setting forth the best opinions. Many audiograms illustrate various points. Chapters are devoted to the important subjects of audiometry in selecting hearing aids and the use of residual hearing.

CHARLES REED WEETH

The Psychiatric Novels of Oliver Wendell Holmes. Abridgment, introduction, and annotations by Clarence P. Oberndorf, M.D. Octavo of 268 pages. New York, Columbia University Press, 1943. Cloth, \$3.00.

Dr. Oliver Wendell Holmes was a very prominent and influential physician, having been associated with Harvard Medical School during his medical career. He is perhaps better known as a man of letters and as the father of the late associate Justice

of the Supreme Court.

Novelists have long used psychoanalytical themes in their works. However, Dr. Holmes was the first physician to do so. Dr. Oberndorf has published abstracts of three of Dr. Holmes' novels and has added scientific notes to supplement and interpret descriptions of psychiatric conditions in the character described by Dr. Holmes. This indeed is a novel idea in psychiatric presentation and should have a wide appeal to the intelligent public as well as to psychiatrists and others interested in the social aspect of mental diseases.

IRVING J. SANDS

Human Gastric Function. An Experimental Study of a Man and His Stomach. By Stewart Wolf, M.D., Capt., (MC), AUS, and Harold G. Wolff, M.D. Octavo of 195 pages, illustrated. New York, Oxford University Press, 1943. Cloth, \$4.75.

This book provides a grandstand seat at the conflicts occurring in the stomach involving motility and gastric secretory activity, as is rarely obtainable. The studies made by these two observers rank high among the contributions given to the literature on gastric function since the first gastric fistula observed as early as 1530.

One can adequately summarize their findings by One can adequately summarize their findings by quoting the last sentence on page 179 of the book: "Dealing actively with the patient's life situation and his reactions to it may then be adequately added as a means for the control of 'dyspepsia,' judged as a means for the control of 'dyspepsia,' jud

gastritis, and peptic ulcer."
This book is a "must" in the library of any physimin interested in gastric function—normal and

BENJAMIN M. BERNSTEIN

Personal and Community Health. By C. E. Turner, Sc.D., Dr. P. H. Seventh edition. Octavo of 585 pages, illustrated. St. Louis, C. V. Mosby Co., 1943. Cloth, \$3.50.

This is the seventh edition of a health book whose value has been recognized for two decades and is now brought up to date. It is intended primarily for health instruction at the university level and to the various age levels in the public schools.

various age levels in the public schools.

The author wisely divides his book into the two fundamental fields of personal health and com-

munity health.

The chapters on personal health discuss the main functional groups of the human from the anatomic

#### 1943's CONTRIBUTION TO MEDICINE

Last year, the greatest advance in fundamental science was to be found in medicine.

Among the many new discoveries that has placed medicine far ahead of other sciences, we find:

Penicillin received most of the popular attention given medical subjects in 1943. Syphilis, osteomyelitis, meningitis, infections of the eye and other organs and tissues were successfully treated by this new startling drug. Derivatives of the drug, patulin and penicillin B also received some attention and proved useful.

In West Africa, three British army physicians discovered in the body a hitherto unknown chemical, believed to be an enzyme, which eats up red blood cells and thus causes anemia. This discovery may pave the way to coping with the dreaded black water fever of the tropics, which like malaria shows

a dangerous reduction in red cell count.

A new means of detecting gas gangrene in its earliest stages was developed by Lister Institute in London. Certain enzymes (hayaluronidases) produced by the wound-infecting organisms can be spotted by chemical means.

A wound healer which shows promise is propamidine. It sterilizes burns that remain infected for months and permits almost immediate plastic sur-

A vaccine produced by Dr. T. S. Potter (University of Chicago) from tubercle bacilli by suffocation has been tested on animals with all types of tubercu-

losis also shows promise.

Further progress was made by Dr. Alfred Taylor (University of Texas) in the research made years ago by Dr. Peyton Rous of the Rockefeller Institute who created a sensation by revealing that when chicken tumor is passed through a filter so fine that even bacteria are held back, a fluid is obtained which when injected into chickens produces the same type of tumor. Dr. Taylor carried this one step farther by injecting a similarly obtained tumor-producing principle under the skin of mice and started tumors that grew more rapidly than transplants. This is the first time a tumor had been transplanted from mammal to mammal.

Attacking viruses—Dr. Max. A. Lauffer (Rocke-feller Institute) obtained fresh evidence that the virus diseases are caused by giant protein molecules endowed with lifelike properties of reproduction and parasitic feeding. In Sweden, workers isolated the virus of infantile paralysis from the brains of 1,000 infected mice, to discover that virtually all young mice are virus carriers and the probability that the virus may remain quiescent before it becomes virulent and attacks the spinal cord and brain. To some of the twenty and more viruses known to plague man, Drs. Murray Sanders and R. C. Alexander added what has become known as "shipyard conjunctivities."

Celiac disease normally treated with banana diets, has been subjected to a bananaless treatment. Crude extracts of liver and B complex vitamins were injected. The rate of recovery was reduced from months and years to as short a time as a month.

Rivalling sodium dilantin, a new formula of diglutamic acid hydrochloride was found helpful in cases of epilepsy, although its use appears effective only in cases of petit mal and psychic attack. It lacks sodium dilantin's effectiveness against "fits."

A more effective method of using the blood collected for banks was made known by Drs. John J. Moorehead and Lester J. Unger of New York. They found that the previously discarded red cells are useful as a dressing for raw and potentially infected surfaces.

#### POSTURE—THE INDEX OF EFFICIENCY

Martha Parker in the New York Times described perfect posture, in the language of industrial medicine, as a prerequisite to the safe performance of any job. In the language of beauty, she added, it is a prerequisite to grace.

Recent surveys made by health departments in a number of war plants disclosed evidence that posture is also an index of efficiency. "In just about every case where a woman worker complains about fatigue and aching muscles," stated the personnel director of a large manufacturing plant, "we found the cause

was bad posture."

Beauty and health experts were called in by industry to act as physiological "efficiency experts" for the women workers and succeeded in improving the carriage and the figure too. Waistlines became slimmer, chests higher, and in not a few cases the shapliness of limbs as noticeably improved.

"The findings of these experts and the corrections they made," comments Miss Parker, "are funda-mental ones that apply to all women in wartime, for there is little difference really, in lifting a tote-box full of instrument parts and picking up a basket full

of the family wash."

Practically all American women are guilty, to an extent, of posture faults, according to an industrial health director, but it took the pressure of war with its need for factory workers and stress on top efficiency, to focus real attention upon them. No doubt, the same mistakes have for years been causing fatigue, pain, and awkwardness to housewives and office workers. Today, in several firms, counselors assigned especially to the job of aiding women workers on their personal problems, stroll through the shops, suggesting here and there that a spine be

straightened, shoulders rolled back, knees relaxed,

Plant advisers suggest a series of "good posture" tricks to cure bad habits of standing, sitting, and walking.

These include the simple "backing into a wall" to cure a "question mark spine"; "log rolling" to remedy slumped shoulders and the resulting flat chest; and the "two-way pull" to overcome locked knees and the resultant swayback.

#### MEDICINE IN THE NEWS

Newsweek of January 31st published the following "note" on the use of thermometers.

"Doctors divide their patients into two classes: the thermometer ostriches and the thermometer peepers. The ostriches are persons who don't want to know if their temperatures soar; the peepers are those who will stop at nothing in order to see the bad news with their own eyes. Last week a story related

by Gen. Dwight D. Eisenhower classified both President Roosevelt and Prime Minister Churchill

as chronic peepers. "At Marrakech, Morocco, the general recalled for London reporters, Lord Moran, Mr. Churchill's chief physician, objected that whenever he approached the Prime Minister's bedside to read the thermometer the patient beat him to the draw by quickly pulling it out and announcing the degree of fever himself. 'I always do that,' the British leader confided. 'I believe these doctors are trying to keep

me in bed.' "General Eisenhower told the story to President Roosevelt as a further example of the Prime Minister's self-reliance. 'Oh, that's nothing new!' Mr. Roosevelt retorted. 'I've been doing that for years.

I don't trust those fellows, either."

#### MORE WOMEN TAKE HIGHER LEARNING

Enrolled students in 674 approved colleges and universities dropped 38.6 per cent in one year-from a total of 750,233 to 460,848 in 1943. Including part-time and summer session students the number of scholars fell off 30.5 per cent-from 1,074,983 in 1942 to 746,831 last year.

These facts were published by Dr. Raymond Walters, president of the University of Cincinnati, in his twenty-third annual survey of attendance in

America's institutions of higher learning.

The enrollment losses would have been considerably greater had not more women flocked to colleges and universities in unprecedented numbers last fall, Dr. Walters pointed out in his report.

In the five educational fields of arts and sciences, engineering, commerce, agriculture, and teachers' colleges—the number of freshmen fell off from 130,-143 to 46,609; a loss of 62.6 per cent in one year. During the same time, first-year women jumped from 86,234 to 92,240; a gain of 6.5 per cent.

#### FRANKLIN ON MESMERISM

One of Franklin's sagest observations on the subject of medicine was that "Quacks are the greatest liars in the world-except their patients."

Accordingly, he was instrumental in debunking the "animal magnetism" therapy cure practices by

Friedrich Mesmer.

Early in 1784 Mesmer's cult was a tremendous fad in Paris, numbering Lafayette and nobles of high rank in his following. Franklin, as a member of the Royal Medical Society of Paris, was appointed by King Louis XVI to serve on a commission examining Mesmer's doctrines and experiments. It was largely through the sagacity of Franklin's report that the charlatan's Hocuspocus was exposed and Mesmer was forced to discontinue his practice.— Benjamin Franklin's Contributions to Medical Science prepared and distributed by the National Franklin Committee of Philadelphia

#### WOUNDS-AND C DEFICIENCY

Dr. A. H. Hunt reported in the British Journal of Surgery that immature collagen (the material that forms fibers in a blood clot) may appear in animals deprived of vitamin C, but when it fails to mature there will be only partial healing, so that wounds may break open again when subjected to strain.

The formation of the fibrous matrix of bone is also delayed when there is a deficiency of Vitamin C.

#### "OUT OF THIS WORLD"

An electrical manufacturer in an advertisement depicts the "automatic secretary" of the future-a recording attachment for the telephone to take messages when you are out.

"All around the clock," reads the ad, "this postwar gadget takes down telephone messages and repeats 'em. . . . with on wrong numbers. . . . whenever

the hard-worked executive gets back from the club." Ingenious? Well, yes, but it is still to be invented. And for someone here is an opportunity to gain fame and fortune.

But who cares for fame and fortune. What we want is the product. Just think how much it could do for any doctor!

"The lowly hen," said a famous product designer, "sees to it that the container is part of the product. It is a very wise thing for her to do. And we can benefit by doing likewise.'

In 1943 the United States Government spent more money than in its entire first 150 years—88 billions of dollars and some cents. Freedom is a luxury these days-but it's still worth all it costs.

A rainproof cigarette has a paper that sheds water and permits smoking in the rain. It is a tasteless, odorless paper designed to withstand all climatic conditions encountered by our armed forces, who will receive the entire output for the duration. paper is also claimed to really enable cigarettes to retain their freshness.

#### SPEAKING OF A WAR?

Casualties on all war-fronts of Americans, from Pearl Harbor to the 1st of this year, according to the Office of War Information, totaled 32,078 killed, 45,595 wounded, 32,478 missing and 29,707 prisoners of war. In all, we lost the use of 139,858 trained soldiers and sailors.

But home-front accident totals, from Pearl Harbor to January 1st, according to the National Safety Council, comprised 190,000 killed and 18,500,000 injured. Traffic accounted for 54,000 dead and accidents in the home for 63,500.

And we shudder over the horrors of war!

## SIMPLICITY

Simplicity of use is essential in any contraceptive technic. No method can be expected to prove effective unless it may be employed conveniently and esthetically. These qualifications promote consistent use and thereby help insure satisfactory clinical results.

Ortho-Gynol Vaginal Jelly, used alone, or with a diaphragm, provides a contraceptive measure which combines a high degree of effectiveness with a minimum of inconvenience. For these reasons it is one of the most widely prescribed preparations of its kind.

#### VAGINAL JELLY

ACTIVE INGREDIENTS: Ricinoleic Acid, Boric Acid, Oxyquinoline Sulfate.

## SHOES AS THERAPEUTIC AGENTS

No doctor can ignore that shoe therapy is a major factor in the treatment of many foot disorders. In some cases, however, when further medical or surgical treatment is required, the shoes must be adjusted to conform to any changes such treatments make in the shape or size of the feet.

Pediforme shoes are prepared through experienced craftsmen to make the necessary adjustments as prescribed by the orthopedic surgeon or physician in these cases.

With purchases restricted it is readily apparent that substantial shoes, capable of reconstruction or easy adjustment, should be prescribed. For all practical purposes, Pediforme footwear may well be considered in shoe therapy.

A SHOE FOR EVERY MEMBER OF THE FAMILY...A SHOE FOR EVERY INDIVIDUAL REQUIREMENT.

## SULFADIAZINE

STAPHYLOCOCCI are among the most tenacious pathogens that afflict man. Their eradication frequently requires not only the utmost in surgical skill, but also the combined action of chemotherapy, immune therapy and hygiene.

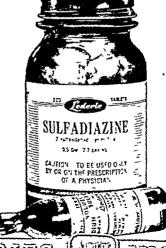

Sulfadiazine is now preferred almost universally for oral administration in these infections, both preoperatively and postoperatively.

One staphylococcal infection that is very frequently caused wholly or in part by staphylococci is osteomyelitis. Sulfadiazine is now widely recognized as a drug of choice for oral administration in the treatment of this serious surgical condition.

Literature will be sent upon request.

#### PACKAGES

# Smoother Relief

# in HEARTBURN and NAUSEA of PREGNANCY

In the light of modern evidence, the heartburn of pregnancy derives—not from a gastric hyperchlorhydria—but rather from a spasm of the cardiac sphincter of the esophagus.\*

Along with nausea of pregnancy, it is thus classified as essentially a neuromuscular disorder, calling for effective spasmolytic therapy.

Donnatal—a compound of phenobarbital with predetermined and controlled proportions of the belladonna alkaloids—proves particularly helpful in these often difficult cases, since it—

Affords all the advantages of natural belladonna alkaloids-

YET IS SIGNIFICANTLY NON-TOXIC;

Provides for the sedation so frequently required—

YET IS ENTIRELY NON-NARCOTIC; AND

Has marked pharmacologic potency-

YET COSTS LESS

It actually costs about half as much as synthetic preparations—even less than tincture of belladonna and elixir of phenobarbital!

Formula: Each tablet contains belladonna alkaloids (hyoscyamine, atropine, and scopolamine) equivalent to approximately 5 min. tr. belladonna, plus 1/4 gr. phenobarbital.

Available: in bottles of 100 tablets.

# THESODATE 3

(the original enteric-coated tablet of Theobromine Sodium Acetate)

CLINICALLY EFFECTIVE LOW TOXICITY EFFECTIVELY ENTERIC COATED

#### DISEASE AND CORONARY ARTERY

Medical authorities in journals and books have substantiated the value of Theobromine Sodium Acetate in treating certain Cardiovascular and Renal Diseases. Actual clinical use has proven the usefulness of Thesodate (Brewer).

The enteric coating of Thesodate tablets permits adequate dosage, so necessary for best results with xanthines, for as prolonged a period of time as necessary.

Supplied with or without Phenobarbital, also with Potassium lodide and Phenobarbital, in potencies for controllable dosage.

Samples and literature on request.

# WHEN THE REstorative POWERS OF TISSUE MUST BE AUGMENTED

In the management of burns and non-infected or infected indolent wounds, Morruguent Ointment has proved of highly beneficial influence on healing. Based on the unsaponifiable active principles present, Morruguent is 25% stronger than cod-liver oil, U.S.P. This greater content of the vitamin-bearing fraction, to which the stimulant influence on wound healing is attributed, accounts for the greater therapeutic value for which Morruguent has been acclaimed by so many physicians.

# MORRUGUENT

Wound odor disappears, necrotic material is liquefied, granulation tissue fills the wound, epithelization begins early, scarring is minimized. Morruguent Ointment is applied directly onto the wound, gauze covered, and the area lightly bandaged. Supplied in 2-oz. collapsible tubes, and in 1-lb. and 5-lb. jars.

#### . \_ ! N IMPAIRED FAT DIGESTION

Degalol, the original chemically pure deoxycholic acid, is the constituent of human bile which is chiefly concerned with the emulsification of ingested fats.

When bile secretion is deficient, or totally lacking as in biliary fistula, the administration of Degalol assures not only digestion and absorption of food fats but also of the fatsoluble vitamins A, D, E, and K.

When fatty foods prove intolerable in the absence of cholecystic pathology, Degalol usually relieves the postprandial distress and permits of liberalization of the diet. Supplied in boxes of 100 11/2 grain tablets.

# In throat infections...

## ULFATHIAZOLE WHERE IT'S NEEDED

To obtain the topical effect of sulfathiazole in certain infections of mouth and throat, without risk of untoward systemic reactions, White's Sulfathiazole Gum offers the advantages of convenience, palatability and effectiveness.

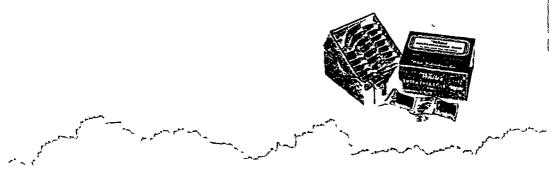

One White's Sulfathiazole Gum Tablet chewed for one-half to one hour promptly initiates a high salivary concentration of locally active (dissolved) sulfathiazole and maintains throughout the maximum chewing period an average topical concentration of 70 mg. per cent.

This high local concentration is ac-

complished despite the fact that blood levels of sulfathiazolear eextremely low and for the most part not quantitatively measurable

Indications: Septic sore throat; acute tonsillitis, pharyngitis; infectious gingivitis and stomatitis caused by sulfathiazole-susceptible micro-organisms; prevention of local infection secondary to oral and pharyngeal surgery (e.g. tonsillectomy).

In packages of 24 tablets, sanitaped in slip-sleeve prescription boxes—on prescription only. White Laboratories, Inc., Pharmaceutical Manufacturers, Newark 7, N. J.

trols assure for Penicillin-C. S. C. uniform potency, sterility, and freedom from pyrogens.

Thus Commercial Solvents Corporation brings to the manufacture of penicillin not only outstanding production facilities, but also the knowledge born of a quarter century of research and actual scientific operating experience, in a field not only difficult but largely unexplored by the pharmaceutical industry in general.

The capacity of the C. S. C. penicillin plant is

conservatively rated at 40,000,000,000 (forty billion) Oxford Units per month. But for the time being its entire production must go to our armed forces. When their needs are met, Penicillin-C. S. C. will be available for civilian medical practice, not only in adequate distribution throughout the United States, but also at the reasonable cost to the patient which is every physician's desire, and which is made possible by C. S. C. volume production.

WHERE PENICIUN C.S C IS DPIED UNDER VACUUM PENICILLIN-C.S.C.

and its Quarter-Century Background

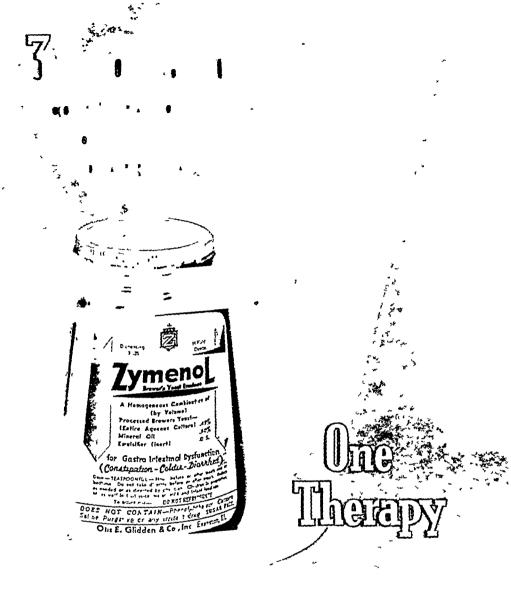

Ehrlich's prophetic vision of the "magic bullet" which would combine deadly efficacy against pathogenic bacteria with perfect compatibility in the human organism, approaches fulfillment in penicillin. Contrary to Ehrlich's expectation, this magic bullet is not a synthetic drug developed by a chemist—it results from the metabolism of a mold. Biologic production of a chemotherapeutic agent thus is now applied in the pharmaceutical field, presenting a new approach.

Instead of the pure rationale of chemical formulas, the life habits of a microorganism are the controlling factor in the manufacture of penicillin; the chemist's important function here consists of guarding his microbian "workmen" and leading them to

maximal production.

It is this type of work in which Commercial Solvents Corporation has been engaged since its beginning. For a quarter century, the life habits of bacteria and molds have been the study to which an ever increasing number of scientists in the C. S. C. Research Laboratories are devoting their lives. From their studies have come valuable products, such as butanol, acetone, vitamins, etc., achieved by exacting standards of sterility, an extremely important factor in the working of the highly sensitive microorganisms. What other manufacturer of any kind in the United States has had comparable experience in the application of microbiologic methods to mass production?

With the confidence born of this experience Commercial Solvents Corporation built, with its own funds, what now may well be the largest penicillin plant in the United States. It incorporates not only the fruits of 25 years of experience, but also the latest developments in the testing, handling, and packaging of a product upon the integrity of which the physician so often may have to stake his patients' lives. Rigid laboratory con-

# Modern Treatment of Constitution

"Smoothage," as provided in Metamucil, brings a modern concept to the treatment of constipation by supplying a bland, nonirritating method of re-establishing normal bowel function.

Metamucil is accepted by the Council on Pharmacy and Chemistry of the American Medical Association.

A highly purified, nonirritating extract of a seed of the psyllium group, Plantago ovata (50%), combined with anhydrous dextrose (50%), Metamucil mixes readily with liquids, is palatable, easy to take.

Supplied in 1-lb., 8-oz. and 4-oz. containers.

# Istrogen Therapy

MAY BE INDICATED IN THE **FOLLOWING** CONDITIONS ...

- Menopausal symptoms
- Senile vaginitis
- Kraurosis vulvae
- Gonorrheal vaginitis of children
- Painful engorgement of the breasts in puerperium
  - Carcinoma of prostate
  - Functional uterine bleeding of probable endocrine origin
  - Also useful for the purpose of suppressing lactation, under certain conditions

Duplicating practically all the known actions of natural estrogens, having the advantage of being relatively more active upon oral administration than its natural counterparts, and being appreciably more economical, the utility of Diethylstilbestrol is gaining ever wider appreciation among clinicians.

## DIETHYLSTILBESTROL SQUIBB

is available in a variety of dosage forms:

Tablets for oral administration: 0.1 mg.; 0.25 mg.; 0.5 mg.; 1.0 mg.; 5 mg.; in bottles of 100 and 1000.

> Ampuls Diethylstilbestrol in Oil (corn), 1-cc., for intramuscular injection: 0.2 mg.; 0.5 mg.; 1.0 mg. and 5.0 mg. in boxes of 6, 25, 50 and 100.

> Pessaries (Vaginal Suppositories) 0.1 mg, and 0.5 mg., boxes of 12 and 50.

A preparation of natural estrogens, Amniotin is also available. It is obtained from urine of pregnant mares-is a highly concentrated, non-crystalline preparation of estrone together with small varying amounts of other estrogenic ketones. It is supplied in corn oil solution for intramuscular use and in capsules for oral administration. Also in pessaries.

Particularly economical is Amniotin in Oil, in 10-cc. vials-10,000 I.U. per cc., and 20,000 I.U. per cc.-and in 20-cc. vials containing 2000 I.U. per cc. These forms also permit utmost flexibility in adjusting dosage to meet the varying needs of patients.

#### Standards of Practice

Public concern with the conduct and practice of medicine is the highest compliment which could be paid to the medical profession. It is exemplified by the recent suit against the A.M.A. in the matter of Group Health, Inc., and by the more recent Moreland Act investigation of abuses under the Workmen's Compensation Act in New York State

The profession has set high standards for itself since the time of Hippocrates. No one from the outside imposed them. They were imposed by physicians upon themselves, and maintained by rigid schooling and discipline. The public has been educated through centuries to expect that these standards will be maintained. It is concerned when it believes that possible laxity has occurred. And rightly so. The medical profession belongs to the public; it is their medical profession, their doctors; the only physicians they have.

The public knows that in this State some 9,000 of its physicians are in the armed services. The public is proud to have it so; people are content that their boys should have the best of medical attention; anything less would be abhorrent and intolerable. People also want the best of medical attention for the workers of the State, the brain workers, the industrial wage earners, the producers of war and civilian goods and material. People intend to have it so, even with the medical personnel of the State depleted by some 9,000 physicians. And the medical profession sees eye to eve with them.

On page 758 of this issue the Council Committee on Workmen's Compensation of the Medical Society of the State of New York submits its study, final report, and recommendations to correct such abuses under the Workmen's Compensation Act as have been alleged to exist. Since 1933, the Medical Society of the State of New York has sought to correct "abuses which were subdivided into those over which they believed the medical profession had at the time no control, and those attributable to the medical profession." (See the report.) Free choice of physician by the employee was recommended at that time. Physicians were required "to indicate in their applications to practice the scope of their medical practice, based upon experience in medical practice and training." For the first time the county medical societies were given definite supervisory powers over the control of medical practice. Arbitration of disputed medical bills was then initiated. Provisions were made for the appointment of impartial medical experts nominated by the medical societies. It was finally recommended, among other things, by the Pool Committee that punishment be provided for rebating and fee-splitting and for other unethical practices, such as solicitation and advertising. It was recommended that medical bureaus be licensed and that x-ray laboratories be owned and operated by qualified physicians.

This latter recommendation was never enacted into law.

It was also recommended in 1935 that the

county medical societies be reimbursed by the industrial commissioner for secretarial expenses in enrolling and registering physicians and for investigation of charges filed against physicians under the Act; for the investigation of medical bureaus; for the activities of the arbitration bureau; and for the expenses of the medical advisory and appeal boards set up by the county societies in each district and for other duties necessitated by the Act. No provisions were made for such appropriations, and "even in the original appropriation," says the report, "no funds were made available for the inauguration of the provisions of the 1935 Law."

It was the opinion of the Pool Committee that the duties of the county societies were limited to "the investigation of charges filed against physicians" and that they did not include the assumption of complete police control over the profession.

The report says further:

"We are bold to state that certain recommendations which were not enacted into law would have served in a large measure to control unethical practices recently unearthed by the Moreland Commission. . . . .

"We are again urging that laymen and lay-owned x-ray laboratories have no place

in medical practice. . . . .

"We must see.... that the functions of the Department of Labor.... and the Workmen's Compensation Boards of the Medical Society are exactly defined, to the end that the compensation boards may be enabled to fulfill their function in regard to the discipline of incompetent and unethical practitioners.....

"In the past, insurance carriers, including the State Insurance Fund, have not had the courage. . . . to cooperate with the medical profession in bringing to light evidence of wrongdoing on the part of certain unethical physicians against whom there has been suspicion, although on innumerable occasions they were invited by the medical societies to submit evidence. . . . .

"Our Workmen's Compensation Bureau has repeatedly recommended the separation of the claims and medical departments of insurance carriers...."

And thus through page after page the

report sets forth the attempts of the Medical Society of the State of New York to have corrected, over the years since 1935, conditions which it knew and stated would arise from inadequacies of the Law and from the apparent reluctance of the Legislature to grant the necessary funds properly to implement what provisions did exist. Only in June, 1943, was an opinion forthcoming from the Attorney General of the State on a question on which authoritative opinion had been sought for years—namely, whether "medical society compensation boards were authorized under the Civil Practice Act, Sections 406 and 356, to subpoena witnesses and to render the oath to witnesses." Such authorization is not contained in Section 13-d of the Workmen's Compensation Law itself. Thus, only since June of 1943 has there been available adequate authority, as we have before stated, to enable the Society to proceed with the investigations and hearings of physicians charged with violations of Section 13-d of the Workmen s Compensation Law.

In the interval since 1935 the Society has not neglected its older function of the constant postgraduate education of physicians of the State. The Council Committee on Public Health and Education and its various subcommittees have made available courses designed to promote the acquisition by all practicing doctors of the latest and most up-to-date knowledge of the advances of medical science so accelerated by the war and by the nation's expanded industrial development.

There can be no compromise with the quality of medical care for the people of this State. Right now the physicians and their medical societies are doing their best to provide for the workers and the people of the State as a whole financially and medically sound prepaid medical indemnity insurance coverage. Plans to extend industrial health programs and to devise means whereby small plants may enjoy the same service as larger ones are being actively pushed in many counties.

Necessarily there is difficulty in implementing some of these desirable plans. Remaining medical men and the hospitals are sorely taxed, even working a seven-day week

and nearly a twenty-four-hour day. Nevertheless, in addition to the practical work of caring for patients, the program of postgraduate study and instruction carried on by the Council Committee on Public Health and Education of the Medical Society of the State of New York is being expanded in order that physicians throughout the State may be in a better position to render better medical service to welfare patients, to sick or injured workmen, to members of insurance plans, to rich and poor alike. Physicians are being taught by other physicians, by plant executives, by students of social science, by research men, by Army and Navy surgeons, by college professors; in hospitals, in clinics, in county society meetings, at the Annual Meeting of the Medical Society of the State of New York, whose purpose as stated in its Constitution is

"to extend medical knowledge and advance medical science; to elevate the standard of medical education; to secure the enactment and enforcement of just medical and public health laws; to promote friendly intercourse among physicians; to safeguard the professional and economic integrity of its members, and to establish and maintain them in appropriate and equitable relationship with the public, with government, and with all agencies working in the fields of health and welfare; and to enlighten and direct public opinion in regard to the problems of medicine and health for the best interests of the people of the State."

Even in wartime. Especially in wartime, that the health of the Nation may remain good and be bettered. That more efficient and advanced medical service may be available to the people. This instructional program is made available through the combined efforts of the members of the Medical Society of the State of New York, the faculties of medical schools and research institutions, the New York State Department of Health, the Dental Society of the State of New York, the Division of Industrial Hygiene of the New York State Department of Labor, and several other organizations and associations.

Copies of the Course Outline Book were distributed as follows: to officers of the Medical Society of the State of New York, members of the Council Committee on Public Health and Education and the Subcommittees, Regional Chairmen in Ob-

stetrics and Pediatrics, State Commissioner of Health, assistant commissioners and directors of divisions of the New York State Department of Health, District State Health officers, city and county Health Commissioners, physicians who arranged courses in the Course Outline Book, presidents, secretaries, and chairmen of public health and program committees of county medical societies, deans of medical schools in the United States, librarians of the medical schools in the State of New York, secretaries of state medical societies in the United States, Commissioners of Health in the various states, members of the New York State Board of Regents, New York State Commissioner of Education and directors of several divisions of the New York State Education Department, officers of the American Medical Association and members of the Council on Medical Education and Hospitals of the American Medical Association, Secretary and Executive Secretary of the State Charities Aid Association, State Commissioner of Mental Hygiene, and Commissioner of the New York State Department of Social Welfare.

The Book contains fifty-seven announcements, including outlines of courses, teaching days, and single lectures on special subjects.

In addition to the instruction offered in the Course Outline Book last year, the Committee arranged for instruction in the following subjects: gynecology, meningococcus meningitis, penicillin therapy, poliomyelitis, and tropical medicine.

Arrangements are being made to increase the instruction in penicillin therapy.

A list of physicians who will discuss subjects pertaining to home and farm accidents will soon be available.

Arrangements for postgraduate instruction, either as courses consisting of a series of lectures or as single lectures, were made for eighteen county medical societies in the following subjects: plasma therapy, tropical medicine, war medicine and surgery, obstetrics and gynecology, general medicine, orthopaedics, poliomyelitis, rheumatic fever, rheumatic heart disease, tuberculosis, nutrition, industrial medicine, cancer.

School health has received much attention. The Medical Society of the State of New York has been interested in the school health program for several years. The Council Committee on Public Health and Education and several subcommittees have concerned themselves with many programs, including the following: (a) school health service organization at the state level; (b) standardization of the physical examination for school children and other youth groups; (c) health education in the elementary and secondary schools, including a required formal course with credit in the high school; (d) the course content for health instruction in the high school; (e) qualifications for school physicians serving less than half (f) undergraduate instruction of

medical students in school health; (g) postgraduate instruction in school health; (h) school health committees for county medical societies (forty-four of the sixty-one county medical societies now have committees on school health); (i) rheumatic fever-rheumatic heart disease as a part of the school health program; (j) health examinations, including x-rays, for teachers and other personnel as a part of the tuberculosis control program, which have been receiving attention during the present year, especially by the Subcommittee on Tuberculosis and Diseases of the Chest.

If medical service to the people can be really improved, by all means let us improve it, for physicians, too, are the sovereign people of the State of New York.

#### Correspondence

Neither the Publication Committee nor the Medical Society of the State of New York is responsible for the opinions expressed in this column. All letters for publication must bear the name and address of the correspondent.

To the Editor NEW YORK STATE J

NEW YORK STATE JOURNAL OF MEDICINE

May I be permitted to comment upon your editorial on regional ileitis in the February 15 issue of the Journal? I prefer to call this disease by its more appropriate and descriptive name of "nonspecific" granuloma of the ileum. The available facts indi-

cate that hypertrophic granulomatous lesions are encountered in infections with amebae, in infections by various strains of the dysentery group, in the group of so-called nonspecific ulcerative colitis, associated with previously existing conditions, such diverticulitis, or as a chronic development apparently unassociated with any preceding condition. In addition, somewhat similar lesions are found in other conditions in the neck and in the abdominal

[Continued on page 733]

#### Announcement

R AISING from 50 to 55 of the maximum age at which specialists can be accepted in the Medical Corps of the United States Navy was announced by Kenneth G. Castleman, Capt., USN (R.) Director of Naval Officer Procurement, Third Naval District.

He also procured that the Navy will accept for "limited shore duty, only" certain

He also announced that the Navy will accept for "limited shore duty, only" certain physicians who cannot meet the regular naval physical requirements. These doctors will be commissioned and assigned to duty at dispensaries, navy yards, naval training stations and naval and Marine Corps recruiting stations. By filling these berths they will be making available for sea and foreign assignment physically and otherwise qualified medical officers now detailed to shore duty.

Physicians seeking commissions in the Naval Medical Corps can apply at the Office of Naval Officer Procurement, 33 Pine Street, New York City, or at the branch office,

Genesee Valley Trust Building, Rochester 4, New York.

# DIAGNOSIS, TREATMENT, AND END RESULTS IN MALIGNANT TUMORS OF THE NASAL SINUSES

G. ALLEN ROBINSON, M.D., New York City

IN REVIEWING my series of 92 cases of I malignant tumors of the nasal sinuses I encountered a wide variety of clinical and histologic types. The diagnosis is rarely made early; either the patient had not presented himself for an early examination, or the family physician or dentist had not taken the patient's complaint seriously. The chief symptoms are pain in the cheek or region of the eye, nasal obstruction, and nasal bleeding and discharge. There is usually an associated sinusitis, oftentimes polypoid in nature. In the later stages there may be prominence of one cheek, protruding eye, tearing, or bulging hard palate. In about one-third of the cases metastases occur to the regional nodes or to other organs, such as the lungs, liver, brain, and spine.

Malignant tumors of the nasal sinuses occur at all ages, although the greatest incidence is found in the fourth and fifth decades. The two sexes appear to be equally susceptible to the disease.

The diagnosis may be made by a careful history and physical examination. Radiographs reveal cloudiness of the sinuses, oftentimes with thinning and erosion of the bony walls. Except in the advanced cases radiographs are only suggestive and not conclusive. In all suspicious cases surgical exploration of the sinuses is indicated. Formal biopsy is the most accurate means of establishing the diagnosis. In certain cases aspiration biopsy is helpful, although many pathologists have not yet sufficient experience to properly evaluate the results of this method. If the maxillary antrum is primarily involved there is often seen a prominence of the cheek with tenderness in the gingivobuccal fold. A simple antrotomy will expose the tumor mass and permit drainage. In other cases biopsy can be obtained from suspicious tissue seen on examination of the nasal cavity.

The majority of cases are squamous carcinoma, grades 2 and 3. There are a few instances of highly cellular anaplastic carcinomata which disseminate early. In addition to the epidermoid lesions there is a small group of sarcomas. These vary from a rather low grade fibrosarcoma to the rapidly growing angio-fibrosarcoma. In one case of myxomatous polyps the recurrences became increasingly more malignant, and after a period of six months biopsy

Read at the Annual Meeting of the Medical Society of the State of New York, Buffalo, May 6, 1943. revealed angiomyxosarcoma which metastasized widely.

There is no one method of treatment of the malignant lesions of the nasal sinuses. A plan of treatment must be outlined for each individual patient. The location, extent of the tumor, and the pathologic type will determine in a large measure the procedures to be undertaken. If the growth is not too extensive or anaplastic, radical surgery and radiation therapy would seem to be the treatment of choice. In the advanced cases and in the cellular rapidly growing cases roentgen therapy should precede operation. Preoperative radiation causes a regression of the growth and renders it less vascular at the time of operation. The technic of roentgen treatment varies, but in the average case two circular fields 7 cm. in diameter are used, one anteriorly over the cheek, and the other laterally to the side of the face. If the hard palate is involved an additional intraoral field 2.5 cm. in diameter is employed. The treatments are given in divided doses of 200 r. units daily to one field until 1,800 to 2,000 r. units have been given to each area. The other radiation factors are 50 cm. distance, 0.5 mm. copper filtration, 10 ma., and 30.8 r. units per minute.

About two weeks after the preliminary roentgen treatments are completed, the growth may be exposed surgically and as much as possible of the tumor removed. At the time of operation intracavitary radium treatment is given. In my experience the use of standard 50 mg. radium tubes has proved satisfactory. The tubes are covered with one to two cm. of packing and applied to the residual tumor areas. For example, if the antrum and ethmoid sinuses are involved one radium tube is applied to the ethmoid area and two radium tubes are placed in the antral cavity. The total dosage for one treatment amounts to 3,000 to 4,500 mg. hours. or 1,000 to 1,500 mg. hours for each tube. I have found that when the tubes are wrapped with at least 1 cm. of packing they do not give too intensive radiation to the bony walls. If residual growth is present after four to six weeks a second intracavitary radium treatment is given, or gold radon implants of 1.5 millicurie strength are imbedded into the malignant tissue. In the advanced cases postoperative palliative roentgen therapy is continued for relief of symptoms.

In the management of malignant tumors of

the nasal sinuses the general condition of the patient must be considered and careful, painstaking local treatments given. Frequent irrigations tend to lessen infection and bone necrosis. Chemotherapy has been of invaluable aid in controlling secondary infection. In many instances the final result depends upon meticulous after-care following the radiation and surgical procedures.

#### Case Reports

Case 1.—Tillie N., aged 50 years, was referred by Dr. A. Lobell on July 8, 1930. The patient had been operated on for polypoid tissue on the right side of the nose ten weeks before admission to the Manhattan Eye, Ear, and Throat Hospital, but no microscopic examination was made of the tissue removed. There was a rapid recurrence, and when first seen at the hospital the entire right side of the nose was blocked with ulcerated tumor tissue. The right cheek was slightly bulging, and on pressure on the cheek it was noted that friable tumor tissue could be extruded from the right side of the nose. Microscopic examination of the papillary mass showed hyperplasia of the mucous membrane and thickening of the epithelial layer, with marked desquamation. There was a definite limiting membrane with active mitosis of the tumor, as well as numerous thin-walled blood vessels. Edematous connective tissue was also present, and a diagnosis of papillary adenocarcinoma was made. The roentgen examination revealed destruction of outer and inner antral walls, but no involvement of the orbital plate. The ethmoid and sphenoid were also involved.

On August 1, 1930, a Caldwell-Luc operation was performed and a portion of the growth was removed. Two 50 mg. radium tubes were applied to the right antrum and one 50 mg. tube to the right ethmoid region for forty-eight hours. A week later one 50 mg. radium tube was applied to the right antrum for twenty-four hours, and on September 18, 1930, two 50 mg. radium tubes were applied to the right ethmoid and sphenoid for five hours. The total radium dosage amounted to 6,500 mg. hours.

There was a stormy convalescence following the operation and radium treatments. Tissue of the right cheek and temporal regions became infected with Staphylococcus aureus and Streptococcus viridans. Several incisions were made for drainage. During the three or four months following the radium treatments large sequestra of bone were removed.

At the present time, twelve years after operation, there is no evidence of new growth. A large defect is present in the hard palate, and there is a partial ankylosis of the lower jaw, which may be accounted for by the contraction of the muscles on the right side of the face, the loss of bony structure, and the scar tissue, which resulted from the abscess formations in the soft tissue.

Case 2.—David M., aged 54 years, was referred to me by Dr. Richard W. Moriarity on June 21, 1930. The patient had always been well except for oc-

casional head colds until March, 1930, when a rather severe hemorrhage which was rather difficult to stop occurred on the left side of the nose. After packing had been removed a friable tumor mass was discovered. Biopsy revealed cellular carcinoma grade 2, Schneiderian origin. No radical operation was done, but three radium treatments, each amounting to 2,000 mg. hours, were applied to the left ethmoid area on June 21, July 3, and July 31, 1930.

The condition gradually improved and the growth subsided; however, secondary sinusitis was present and considerable inflammation and pain persisted in the left side of the face. On March 10, 1931, both antra were explored by a Caldwell-Luc operation by Dr. Ross Faulkner, and no evidence of growth was seen or revealed by histologic examination. The right antrum contained purulent discharge, and the left antrum showed thickened membrane. However, the patient's general condition did not improve, and after consultation Dr. Douglas Quick removed the contents of the orbit because of the pain and infection. The orbital plate showed osteomyelitis, but no growth was found in the orbit. The patient has now regained his normal weight and there is no evidence of malignancy.

Case 3.—August P., aged 67 years, was referred to me by Dr. Anthony Nigro on February 14, 1940, for postoperative radium treatment for an extensive carcinoma involving the left antrum and ethmoid cells. A Caldwell-Luc operation had been performed by Dr. Nigro on February 9, 1940. The pathologic report submitted by Dr. Andrew A. Eggston revealed epidermoid carcinoma grade 4.

The first radium treatment, given on February 14, 1940, consisted of applying 110 mg. in three tubes for twenty-four hours. Two weeks later divided doses of roentgen ray therapy over a period of three months were started for a total of 5,000 r. units in one anterior and one lateral field. The factors used were 50 cm. target skin distance, 0.5 mm. copper filtration, 200 kv., 8 ma., 30.8 r. per minute, 200 r. per treatment, and a 7 cm. diameter field.

During the summer of 1940 the infection invaded the left orbit, necessitating enucleation of the eye and removal of the orbital plate on September 11, 1940. No evidence of tumor was present, only pus and granulation tissue were revealed. The patient is now in good general health, prostheses have been applied, and there is no evidence of recurrences to date.

Case 4.—Catherine S., aged 64 years, was first seen by me in St. Vincent's Hospital on September 24, 1935. During the summer the patient had developed a severe pain in the right check. She consulted Dr. John Lore, who advised admission to the hospital for a Caldwell-Luc operation. A squamous carcinoma was found filling the entire right antrum and extending into the ethmoid cells. The outer and inner walls of the antrum were invaded but not the orbital wall nor the bony palate.

Three radium treatments were given postoperatively, the first on September 24, 1935, using two standard 50 mg. radium tubes with 0.5 mm.

-----

platinum equivalent filtration for thirty hours. The second treatment was given two weeks later using 80 mg. for twenty hours. A month later, November 9, 1935, the last treatment was given, employing a 50 mg. tube for twenty hours. The total dosage of the three treatments amounted to 5,600 mg, hours.

The convalescence was not easy; severe pain was present for several months, requiring opiates for relief, but nearly a year later the necrotic bone became separated and the infection subsided. There has been no recurrence in the seven years since

the last radium treatment was given.

Case 5 .- Isaac T., aged 60 years, had complained of pain in the right cheek for six weeks. Examination revealed that the right cheek was prominent and a hard tumor mass could be seen in the upper gum margin. A tentative diagnosis of epulis was made, but on more careful examination a clinical diagnosis of carcinoma of the right antrum was made. Radiographs showed erosion and struction of the anterior and lateral walls of the antrum. At operation on September 25, 1934, the walls were found to be spontaneously eroded. The mass which filled the antral cavity was curetted away and pathologic examination revealed epidermoid carcinoma showing calcification and extensive necrosis. During the six months' period following operation 5,200 mg. hours of radium were used in divided doses.

The patient remained well until April, 1939, when he developed an acute attack of tonsillitis. The tonsils remained unusually large after the attack had subsided. Tonsillectomy was advised, but refused by the patient. In October, 1939, radiation therapy was started and 600 r. units were given in divided doses to each side of the neck,

The response was satisfactory.

A complete blood count on April 4, 1938, revealed 86 per cent hemoglobin, 4,300,000 red blood cells, 7,050 white blood cells, 31 lymphocytes, 8 monocytes, 53 neutrophils, 7 immature neutrophils, 1 basophil. The blood examination on October 18, 1939, showed 79 per cent hemoglobin, 4,090,000 red blood cells, 13,200 white blood cells, 52 lymphocytes, 3 monocytes, 41 neutrophils, 3 immature neutrophils, and 1 basophil.

The patient was not seen from July 10, 1940, to April 21, 1941, at which time the tonsils were again greatly enlarged and several lymph nodes were present in each side of the neck and in each axilla. There was no evidence of carcinoma in the nasal sinuses. On April 30, 1941, the blood count revealed 70 per cent hemoglobin, 3,408,000 red blood cells, 12,900 white blood cells, 81 lymphocytes, 19 neutrophils. A diagnosis of mild lymphatic leukemia was made. The response to radiation therapy to the enlarged lymph nodes has been satisfactory, the general condition of the patient is good, and the blood picture is greatly improved.

Case 6.—Stephen K., aged 7 years, was referred to me by Dr. G. B. Gilmore on April 19, 1937, for postoperative radiation therapy for a malignant tumor found involving the maxillary antrum. A Caldwell-Luc operation had been performed eight

days previously by Dr. Gilmore, and a firm vascular mass was found which extended to the orbit and had caused a slight bulging of the hard palate. The pathologic report by Dr. Jacob Geiger revealed that it was a new growth of small and large spindle cells in an edematous and hyaline stroma. The cells had apparently sprung from the periosteum of the bone. There were giant cells scattered throughout the growth; areas of necrosis and roundcelled infiltration were also present. The microscopic diagnosis was osteogenetic sarcoma.

The radiation therapy was given through three fields: one anteriorly, another laterally to the cheek, and one intraorally, using a cone 2.5 cm. in diameter. The external fields were given through portals 4 cm. in diameter. The other radiation factors were 50 cm. distance, thoraeus filter, 8 ma., 14.25 r. per minute, and 100 to 150 r. per treatment. From July 6, 1937, to December 18, 1937, a total of 8,100 r. units were given through the three

fields.

The patient is now in good general health, with no evidence of active disease. There is a slight atrophy of the right cheek due to the retardation of the normal growth by the roentgen therapy. His weight has increased gradually from 58 pounds in 1937 to 115 pounds in 1942.

Case 7.—Martha B., aged 20 years, was referred to me by Dr. Murray Last for postoperative radiation therapy on July 7, 1937. The history of the case was that in April she had noticed pain in the left cheek and on May 18 an upper left molar was removed. A few days later a small circumscribed tumor mass was noticed in the outer portion of the left orbit. On June 15, 1937, the mass was surgically removed in the Manhattan Eye, Ear, and Throat Hospital by Dr. Last. The pathologic report submitted by Dr. Eggston showed that the mass was fibrosarcoma.

The postoperative radiation therapy was divided doses of roentgen ray from July 7, 1937, to September 20, 1937, and amounted to 3,950 r. units. The factors used were 50 cm. target skin distance, thoraeus filter, 8 ma., 14.25 r. per minute, and a 4 cm. diameter field, giving 150 r. per dose. The growth was apparently radioresistant and was

not controlled by roentgen ray treatment.

On September 27, 1937, an exenteration of the orbit was done. The orbital floor was involved and the growth had invaded the left maxillary antrum and ethmoid cells. Eight gold radon implants, 1.5 millicuries each, were imbedded into residual tumor at the time of operation. Three additional radium treatments were given on October 6 and 25 and November 10, 1937. Standard radium capsules filtered with 0.2 mm. of platinum and 1.0 mm. of brass were applied. Two tubes were used at each treatment, one in the antrum and one in the orbit. One centimeter of gauze packing was placed around the tubes. The three radium treatments amounted to 3,760 mg. hours.

The convalescence was stormy and prolonged. There was a great deal of secondary infection and radiation necrosis. The patient became very weak and the prognosis seemed grave. However, even-

tually large sequestra of bone were removed from the antrum, which included most of the hard palate on the left side. The patient has gained in weight from 37.5 pounds to her normal weight of 100 pounds. Prosthesis applicators have been applied to the orbital and oral defects and at the present time there is no evidence of malignant disease present.

### Summary

1. Careful history and complete examination of the nasal sinuses are indicated in suspected cases of cancer of the nasal sinuses.

2. Careful study of the microscopic structure of the tissue removed at operation for chronic sinus disease will sometimes reveal early malig-

nant changes.

- 3. Radiographic examination of the sinuses will show the extent of involvement, but the radiographs are not conclusive in early cases. They are of most value if correlated with the clinical findings.
- 4. The extent of the growth, the type of lesion, and its life history determine in a large measure the type of treatment to be used.
- 5. As a rule, operation and postoperative radiation are employed in the early cases, except in the anaplastic types, which should receive radiation preoperatively.
- 6. In the advanced cases pre- and postradiation therapy by means of roentgen ray and radium are employed.
- 7. Adequate surgical exposure to establish drainage and make accessible the nasal cavities for radium application is important.
- 8. Nineteen patients in a series of 92 cases have survived three years or more without evidence of recurrence. In this group are included 4 cases of fibrosarcoma, one case of angiosarcoma, and one case of lymphosarcoma. A three-year survival rate of 20 per cent has therefore been obtained.
- 9. In the group of nineteen patients one patient died seventeen years after treatment with no evidence of recurrence; one patient died of heart disease seven years after treatment, free of cancer; one patient died of recurrence of cancer fifteen years after the initial treatment; one patient, well for six years, has developed a recurrence in the opposite ethmoid area; fifteen patients are living and free of the disease three to seventeen years after treatments were begun.

#### Discussion

Dr. Andrew H. Dowdy, Rochester—Dr. Robinson has given us an excellent discussion of a very difficult group of tumors, difficult of early diagnosis and difficult in treatment. Early diagnosis is difficult

because these tumors are frequently asymptomatic until they attain sufficient size to produce pain or obstruction by pressure on or invasion of adjacent structures. Many of the primary tumors, such as lymphosarcoma and transitional cell carcinoma, may remain insignificant in size for some time and the first indication of trouble is regional metastases.

Hemorrhage is a symptom only after ulceration has occurred. To further complicate the picture, there is usually an associated paranasal infection which may be erroneously given the causative role of the patient's difficulty.

Most of the malignant tumors occurring in the maxillary antri are squamous cell carcinomas. Some students in this field even doubt the existence of fibrosarcomas in this region and feel that most so-called fibrosarcomas in this area are in reality

anaplastic squamous cell carcinoma.

In general, preoperative roentgen therapy, followed by surgery and postoperative radium therapy, gives the best results in the less anaplastic tumors. The roentgen irradiation controls the local coexistent infection and reduces the size of the tumor. Operation serves to remove the gross residual tumor and exposes the tumor bed so that adequate radium treatments may be carried out under direct visualization. Operation also facilitates the postirradiation care. In anaplastic tumors of the paranasal sinuses radiation therapy is often effective and less mutilating.

As Dr. Robinson has brought out, the treatment is radical; considerable discomfort to the patient and sequestration of bone can be expected. Frequently repeated applications of radium are necessary over a variable length of time.

Dr. Robinson's Case 6 is interesting in that he obtained a six-year cure of an osteogenic sarcoma of the maxillary antrum with roentgen irradiation only. It is unusual in respect to the type of tumor in this location and in its cure by radiation therapy. Personally, I would be inclined to check the histologic tissue in this instance again.

The suggestion of a careful histologic study of the tissue removed at operation for chronic sinus disease is a good one and cannot be too strongly emphasized.

I believe the salvage rate in this group of tumors is increasing and will continue to do so with a more careful diagnosis and individualized treatment, once the diagnosis is established.

Dr. Walter L. Mattick, Buffalo—First, I want to compliment the author for the fine presentation of a goodly series of 92 cases of malignant tumors of the nasal sinuses. I note that under this caption he has dealt almost exclusively with tumors probably, in the majority of cases, primary in the antrum. His point about diagnosis seldom being made early is well chosen and should be given more serious thought by otolaryngologist and dentist.

In the routine examination of these cases a sign of considerable importance and helpful to us is that of abnormal resilience of the palate, alveolar arch, or lateral antral wall as felt through the mouth by palpation. It is well worth looking for and will often help to confirm radiographic suspicions before acquiring the telltale biopsy.

I note that in the 7 cases cited the author frequently encountered radionecrosis and infection. This is surely a discouraging complication incident to treatment in a number of cases. I note that some of these cases date back to 1930, when we were probably all more heroic in our radium dosage; nevertheless, I cannot help but wonder if some of these unfavorable reactions could not have been avoided by using greater filtration, perhaps I mm. platinum as a minimum, on the radium element tubes. I venture to say that the author is probably using heavier filtration now.

Another useful method in selected cases, ap-

parently not mentioned in this paper, is the insertion of radium element needles of 0.6 mm. platinum equivalent through the cheek in very advanced lesions and often into the orbit in contact with the orbital plate where the tumor has broken through this structure. Such procedure often is of great help in palliating these advanced lesions.

The author's three years' arrest rate of 20 per cent is very good. At the State Institute, a recent eursory survey would indicate from 25 to 30 percent three-year arrests in a series of 42 cases seen between 1932 and 1938.

In closing I again wish to compliment the author on this very excellent presentation.

### FINGERPRINTING MEDICAL DIPLOMAS

From time to time the public is imposed upon by some charlatan passing himself off as a graduate in medicine. We have recently come into possession of a manuscript book by the late Robert P. Harris entitled Untruthfulness. Most of it concerns the fival claims of three Louisiana doctors for the credit of performing an early cesarean operation. A part is about a doctor who reported the "First Symphysiotomy in America." This doctor, who lived in an Alabama town of seventy-five inhabitants, was an Alabama town of seventy-five inhabitants, was an A.M., M.D., Ph.D., and LL.D. He was a member of the Edinburg Gynecological Society, the Dublin Obstetrical Society, the Association for the Advancement of Science, a Fellow of the Society of Arts, London, and Honorary Fellow of the Society of Zoological Research, Berlin. Upon investigation the operation was found to be entirely imaginary; the patient could not be found and the place in which the operation was said to have been performed did not exist. The "doctor" claimed to have graduated from the University of Georgia. He had matriculated there but left under a cloud. He exhibited a diploma from Western Reserve which was bogus. His local medical society denounced him as an imposter and fraud, forthwith expelling him.

poster and fraud, forthwith expelling him.

The recent case in California of J. H. Phillips is a familiar one. Phillips posed successfully as a surgeon in C.C.C. camps and in a California hospital. He was exposed accidently when he failed to conform to the peculiar California law about signing prescriptions. Upon investigation it was found that he had a long history of crimes and prison sentences.

He had secured a diploma from the University of Tennessee School of Medicine by posing as a former graduate of the school by the name of Dr. James H.

Phillips.

Dr. Maurice H. Rees, Dean of the University of Colorado School of Medicine (Journal of the Association of American Medical Colleges, May, 1943) says that such mistakes can be easily avoided by the simple procedure of having the graduate put his fingerprints on the back of his diploma when it is given to him. State licensing bodies and the National Board of Medical Examiners should also adopt the same policy. All certificates of special achievement which might be stolen and used illegally or to the embarrassment of the owner should carry fingerprint identification.

According to Rees the introduction of the fingerprint identification system to this country was
largely due to Mark Twain. In his Life on the Mississippi and Pudd'nhead Wilson he made the statement that no two fingerprints were alike and that
fingerprints did not change from birth to death.
These statements have been proved to be absolutely
correct. Unfortunately, until recently fingerprinting has been confined to criminals, so that the procedure carries with it the odor of disrepute. Now that
it has been adopted by the Army and the Navy this
method of identification should become respectable.
It would seem that now is a good time for the medical profession to adopt it. Every important document should carry the plain impressions of three
fingers of the owner's right hand as a means of identification.—Editorial in the Virginia Med. Monthly

# DRUG PRODUCES CANCER

Urethane, a drug in common use as a sedative, has been discovered to be a powerful producer of cancer of the lungs, in experiments on mice at the National Cancer Institute at Bethesda, Maryland, by Drs. Anderson Nettleship, Paul S. Henshaw, and Henry L. Meyer. Experiments with x-rays were being made on the mice, which were of a strain that never had developed more than 5 per cent of cancer cases.

Later, 90 per cent of the animals were discovered to have multiple cancers of the lungs. A

careful search was made for the cause. It proved to be the ethyl carbamate (urethane) which was injected as a sedative. The possibility of impurities being the cause was eliminated when some highly purified urethane produced the tumors. When the chemical was administered to a strain of mice which has a very high incidence of spontaneous lung tumors, the time of appearance of the tumors was advanced several months.—From "What Scientists Are Doing" in the New York Herald Tribune, Feb. 13, 1944

tually large sequestra of bone were removed from the antrum, which included most of the hard palate on the left side. The patient has gained in weight from 37.5 pounds to her normal weight of 100 pounds. Prosthesis applicators have been applied to the orbital and oral defects and at the present time there is no evidence of malignant disease present.

#### Summary

1. Careful history and complete examination of the nasal sinuses are indicated in suspected cases of cancer of the nasal sinuses.

2. Careful study of the microscopic structure of the tissue removed at operation for chronic sinus disease will sometimes reveal early malignant changes.

3. Radiographic examination of the sinuses will show the extent of involvement, but the radiographs are not conclusive in early cases. They are of most value if correlated with the clinical findings.

4. The extent of the growth, the type of lesion, and its life history determine in a large measure the type of treatment to be used.

5. As a rule, operation and postoperative radiation are employed in the early cases, except in the anaplastic types, which should receive radiation preoperatively.

6. In the advanced cases pre- and postradiation therapy by means of roentgen ray and

radium are employed.

7. Adequate surgical exposure to establish drainage and make accessible the nasal cavities

for radium application is important.

- 8. Nineteen patients in a series of 92 cases have survived three years or more without evidence of recurrence. In this group are included 4 cases of fibrosarcoma, one case of angiosarcoma, and one case of lymphosarcoma. A three-year survival rate of 20 per cent has therefore been obtained.

#### Discussion

Dr. Andrew H. Dowdy, Rochester-Dr. Robinson has given us an excellent discussion of a very difficult group of tumors, difficult of early diagnosis and difficult in treatment. Early diagnosis is difficult

because these tumors are frequently asymptomatic until they attain sufficient size to produce pain or obstruction by pressure on or invasion of adjacent structures. Many of the primary tumors, such as lymphosarcoma and transitional cell carcinoma, may remain insignificant in size for some time and the first indication of trouble is regional metas-

Hemorrhage is a symptom only after ulceration has occurred. To further complicate the picture, there is usually an associated paranasal infection which may be erroneously given the causative role of the

patient's difficulty.

Most of the malignant tumors occurring in the maxillary antri are squamous cell carcinomas. Some students in this field even doubt the existence of fibrosarcomas in this region and feel that most so-called fibrosarcomas in this area are in reality anaplastic squamous cell carcinoma.

In general, preoperative roentgen therapy, followed by surgery and postoperative radium therapy, gives the best results in the less anaplastic tumors. The roentgen irradiation controls the local coexistent infection and reduces the size of the tumor. Operation serves to remove the gross residual tumor and exposes the tumor bed so that adequate radium treatments may be carried out under direct visualization. Operation also facilitates the postirradiation care. In anaplastic tumors of the paranasal sinuses radiation therapy is often effective and less mutilating.

As Dr. Robinson has brought out, the treatment is radical; considerable discomfort to the patient and sequestration of bone can be expected. Frequently repeated applications of radium are neces-

sary over a variable length of time.

Dr. Robinson's Case 6 is interesting in that he obtained a six-year cure of an osteogenic sarcoma of the maxillary antrum with roentgen irradiation only. It is unusual in respect to the type of tumor in this location and in its cure by radiation therapy. Personally, I would be inclined to check the histologic tissue in this instance again.

The suggestion of a careful histologic study of the tissue removed at operation for chronic sinus disease is a good one and cannot be too strongly emphasized.

I believe the salvage rate in this group of tumors is increasing and will continue to do so with a more careful diagnosis and individualized treatment, once the diagnosis is established.

Dr. Walter L. Mattick, Buffalo-First, I want to compliment the author for the fine presentation of a goodly series of 92 cases of malignant tumors of the nasal sinuses. I note that under this caption he has dealt almost exclusively with tumors probably, in the majority of cases, primary in the antrum. His point about diagnosis seldom being made early is well chosen and should be given more serious thought by otolaryngologist and dentist.

In the routine examination of these cases a sign of considerable importance and helpful to us is that of abnormal resilience of the palate, alveolar arch, or lateral antral wall as felt through the mouth by palpation. It is well worth looking for and will

# Bacteriology

An organism of the paratyphoid enteritidis group of the type designated as Salmonella derby was isolated from the stools of four patients from the college alumni group, two members of the staff who were ill, the guest not associated with the dinners, and the one member of the kitchen staff who was not ill. Serum from three of the patients agglutinated the organism that was isolated.

Salmonella derby was first isolated in connection with the investigation of an outbreak of 37 cases of food poisoning which occurred in Derby, Belper, and Ambergate, reported by Peckham and Savage.<sup>1</sup>

In the Derby outbreak the organism was isolated from pork pie that was believed to have been responsible for the outbreak, from the tank water in the slaughter house where the pork was prepared, and from a guinea pig which had been inoculated with a portion of the incubated tank water. No specimens of feces from patients were examined, but blood from four of the patients agglutinated the pork pie bacillus.

Salmonella derby has since been reported in isolated instances from time to time in this country, in South America, and in Europe, but so far as is known it has not been responsible, previously, for an outbreak of gastroenteritis other than the Derby outbreak.

Several fecal specimens were submitted from each of the kitchen workers and the waiters in the hotel and, with one exception, all were negative. Several fecal specimens were submitted from an assistant cook who gave no history of illness, and a few colonies of the organism were found in one specimen. He would have to be considered at least a transient carrier. Whether or not he was a carrier before the outbreak could not, of course, be determined.

Unfortunately no portion of the food served was available for laboratory examination. Several specimens of water from the taps used in serving the dinner were examined and although a slight increase in the total count over the city

water was found, there was no evidence of the presence of the colon group.

### Symptomatology

In the Derby outbreak the chief clinical symptoms were reported as being pain in the abdomen and extremities, violent vomiting, diarrhea, and pyrexia. There were no deaths, but in some cases the illness was severe and lasted for three weeks.

In the hotel outbreak the typical picture consisted of a sudden onset with acute abdominal pains and severe diarrhea with watery stools. Table 1 shows the incidence of various symptoms in a group of 34 cases. This group and 5 individuals who remained well comprised exactly 50 per cent of the 78 who attended the college alumni dinner and who were personally visited by a member of the District staff or by a representative under the direct supervision of the District Office. It is the data relating to this group which have been analyzed and are presented in the tables. Chills and fever occurred in about two-thirds of those who were infected. Among those whose temperatures were taken the range of maximum temperature was from 101 to 104 F. Generalized aching of a "grippy" nature and headache also occurred in about twothirds of the cases. Nausea and vomiting were of less frequent occurrence. Four of the patients stated that they had noticed mucus in the stool. No one noted the presence of blood. Most could give no information relative to the appearance of the stools. Of the 88 per cent of the patients who reported diarrhea, two-thirds had had between five and ten stools in one day and one-third more than ten, the greatest number reported being thirty in one day.

Three months after the outbreak a survey of 29 cases was made to determine the duration of illness. The average period of illness in these cases was twelve days. Five patients of this group had definite relapses after initial complete freedom from symptoms and two more gave a suggestive history of relapse. Among the 29 patients who were visited in the resurvey, there were 3 cases of severe sore throat apparently associated with the gastroenteritis. There was at least one case of sore throat in the insurance group. One patient reported illness lasting for a period of eighty-four days, and one patient developed an empyema which lasted for seven

### A HOTEL OUTBREAK OF GASTROENTERITIS DUE TO SALMONELLA DERBY

F. E. Coughlin, M.D., Albany

THE occurrence of an outbreak of communi-L cable disease due to food or water in a large city hotel presents important problems to the administration of the hotel and to the health official. Unfavorable publicity may mean a serious loss of patronage to a hotel which may be operating on a very small margin of profit. The hotel also faces the possibility of numerous legal procedures to recover real or imagined damages. Even though they may be covered by insurance, hotel owners find such suits very unprofitable. What is more important from the standpoint of this report is the fact that the health official faces the problem of making a satisfactory investigation at a time when those exposed to the infection may have scattered to homes in widely separated localities.

An outbreak of gastroenteritis, which occurred among the guests of a New York State hotel in May, 1940, presented these problems to the hotel management and to a district office of the New York State Department of Health. On May 9 a report was received that one of the workers in the Division of Laboratories and Research of the State Department of Health was ill with diarrhea following a dinner at this hotel, and an

investigation was instituted.

It was learned that the dinner, held by a college alumni group, had been attended by 78 persons, largely composed of clergymen, physicians, lawyers, and other professional people, including special representatives of the college residing in various communities both within the Albany district and outside. Of those who attended the dinner 34 were from Albany, 14 from Troy, 9 from Schenectady, 5 from scattered communities in the Albany district, 12 from other communities in New York State, and 4 from Massachusetts. After investigation it was found that 70, or approximately 90 per cent, of the 78 persons who attended the dinner became ill with gastrointestinal symptoms.

Although two other dinners were held at the hotel the same evening with practically the same menu as that served to the college alumni group and although they were served from the same kitchen, no illness is known to have occurred among those attending these two dinners. Two cases of gastroenteritis were reported following a lodge dinner held at the hotel six days later and

Read at the Annual Meeting of the Medical Society of the State of New York, Buffalo, May 5, 1943.

District State Health Officer, New York State Department of Health, Albany, New York.

attended by 132 persons. However, fecal specimens submitted from those two individuals were negative and since none of the 130 other persons attending the dinner was known to have been ill, other sources of infection could not be excluded, and these two were not considered as a part of the outbreak. At about the same time a large dinner attended by approximately 500 persons, including high officials of the state and local government was held in the same hotel, and none of these was known to have been ill. Among the hotel staff and the regular guests, including the patrons of the main dining room and the coffee shop, there were only 3 cases discovered. Two members of the hotel staff, the chief cook, and the secretary to the Manager, and one outof-town guest, all of whom ate in the coffee shop, became ill with symptoms similar to those of the college alumni group.

About two weeks after the college alumni dinner a second outbreak of gastroenteritis occurred following a convention of representatives of an insurance company held at the same hotel. This convention was attended by 20 persons residing in thirteen cities located in five states. Two meals were served in connection with this convention. One, an evening dinner held in Parlor B on the twelfth floor, was served to 19 persons and a luncheon the same day at 12:30 P.M. in Room 2 on the second floor was served to 18 persons. (The college dinner had been held in a first floor dining room.) From reports received from the various departments of health concerned it was found that at least 10 of the 19 who ate the evening meal became ill and at least 6 were not ill. From the reports received it was not possible to determine which item of food or drink may have been responsible for the outbreak, nor was it possible to state definitely whether it was the luncheon or the dinner which was responsible for the illness. No information is available relative to bacteriologic examination on specimens from any of the persons concerned with the insurance company's dinner.

Therefore it cannot be stated definitely whether or not this outbreak was due to the same organism as the one which caused the illness following the college alumni dinner, although it seems quite possible. Since 1940 no similar illness has been reported among guests in the hotel or the dining rooms of the hotel although thousands of guests have been accommodated

reliable information in all cases as to whether the cookies eaten were cream filled or not cream filled. However, since it was known that many persons who ate cookies did not eat cream-filled cookies, it was believed that the outbreak was not due to the cookies.

Hollandaise Sauce.—Although hollandaise sauce is known to be a good culture medium for bacteria, the difference in the attack rates in those who ate the food and those who did not was within the limits of chance variation. While this item could not be definitely excluded, there was no evidence to prove that it was the source of infection.

Chef's Salad and Dressing .- In the group analyzed all of those who gave a history of eating chef's salad, with one exception, became ill, whereas only 7 of the 11 who stated that they did not eat chef's salad became ill. The difference in the attack rate among those who ate the salad, 96.6 per cent, and those who did not eat it, 55.5 per cent, was statistically significant. The assistant chef, the only hotel employee in the kitchen and dining room in whose stool Salmonella derby were found and who remained well, was in charge of the preparation of the chef's salad which was served at the college alumni dinner as well as the salad which was served at the insurance dinner. Although it does not appear to be reasonable that a carrier of this organism, who apparently had few of the organisms in his stool and who cleared up so promptly, would be in a position to contaminate salads sufficiently for an entire dinner and infect such a high percentage of those who ate the dinner without a possibility of incubation of the organism in the salad and although 7 persons who became ill stated that they did not eat the salad, it is nevertheless believed that the salad and the possibility of its having been contaminated by the assistant chef cannot be eliminated as a possible cause of the outbreak. It may be that the 7 who did eat the salad and the 3 who did not attend either dinner became ill from some other foods which might have been handled by the assistant chef even though his main duties had to do with the preparation of salads.

Ice.—Ice was manufactured in the ice-making plant of the hotel and was used in the water that was served at the dinner, in the alcoholic beverages served, and also in the celery and olive dishes. On inspection of the ice-making machine, it was found that the freezing tank, which was placed in the basement of the hotel, was located in such a position that it might be possible, in case of leaks, for sewage from the drain pipes which passed overhead to drip into the tank. While there was no evidence that there had been leaks or that water other than that

due to condensation had dripped into the freezing tank, it was recommended that the use of the tank be discontinued. This was done and since the time of the investigation all ice used in the hotel has been purchased. It was also found that storage facilities for the ice had not been given proper care. However, since this ice had been used in all dining rooms in the hotel and for other special dinners, it was not considered the source of the outbreak.

Water.—The water supply for the hotel was from the regular municipal supply which was of a safe quality. Because of the outbreak of amebic dysentery in Chicago in 1933,3-6 the possibility of back siphonage as a source of infection within the hotel was thoroughly investigated. This possibility was further suggested by the fact that the water for the college alumni dinner was drawn from a dead-end tap in the basement of the hotel. Against this possibility was the fact that the insurance dinner was held on the twelfth floor and the absence of cases among guests in the hotel other than those who ate in the coffee shop. On the other hand, there is the possibility that a "slug" of pollution might have entered the distribution system in the hotel causing infection in the basement one day, and at another time the same occurrence might have caused infection on the twelfth floor without affecting the quality of the water in other parts of the hotel.

On investigation many potential public health hazards were found in the plumbing arrangements and in the plumbing fixtures. All water for the hotel building is delivered through a sixinch pipe which passes across the ceiling of the sub-basement to a series of five pressure filters. After passing through the filters, the water is piped to a suction tank in the basement. It is then pumped to two interconnected tanks on the fourteenth floor of the hotel. From these tanks it passes through a common discharge header to the ceiling of the twelfth floor in the socalled new building or annex, and feeds several lines, extending from the twelfth to the second floor and supplying water for the guest rooms. On the second floor of the old building of eight floors is a distributing network of pipes similar to that on the twelfth floor of the new building. In this building the distribution system is similar to that in the new building except that the water is fed up to the rooms instead of down. In the old building there is also an extension of the feed main up the west wall to the eighth floor. This feeds two pipes, supplying three rooms on each floor to the second.

There are two systems of circulating ice water, one for the old part and one for the new building. The new building system is supplied from the

months after the dinner. In this case stools and drainage from the pleural cavity four months after the onset of illness were positive for Salmonella derby.2

#### Incubation Period

The incubation period was relatively short. The shortest period was approximately seven hours, the longest forty-two hours. In 27 of the 34 cases (79.4 per cent) the onset was within twenty-four hours following the dinner.

### Age and Sex

All of those who became ill were adults and, with the exception of the manager's secretary, all were males, since only male adults attended the two dinners that were involved. shows the age distribution in 34 cases.

#### Food

Mushrooms Olives Celery Cream (in coffee)

Tables 3 and 4 show the consumption of each item of food on the menu by each individual in the group of 39 mentioned above.

Table 4 shows the attack rates of those who ate or did not eat each food item. It will be seen from the table that only a few food items can be definitely excluded as a possible cause of the infection.

Twenty-four residents of the city of Albany who were known to have been ill following the dinner were investigated by the Albany City Health Department. Dr. S. J. Gormley, Acting Health Officer reported that all of this group ate the fruit cut, soup, steak, mushrooms, potatoes, Two did not eat chef's salad with and coffee. dressing, two did not eat the asparagus and hollandaise sauce. One did not eat ice cream. One did not eat cookies. The addition of these data to Table 4 does not materially alter the result. The addition of the data received from the various health departments relative to those attending the insurance dinner also does not materially alter the findings. The following items were considered as the most important possibilities as the source of infection and demand some discussion—i.e., cookies, hollandaise sauce, chef's salad and dressing, ice, and water.

Cookies .- At first it was believed that the cookies served were cream filled. However, on investigation it became evident that several varieties of cookies were served, some of which were not cream filled. It was not possible to obtain

#### Discussion

Miss Marion B. Coleman, Albany (by invitation) -Dr. Coughlin's paper is of particular interest from a laboratory point of view since it illustrates the epidemiologic value of identifying a species that is encountered relatively rarely, and thus justifies the costly production of serums necessary for the differentiation of members of the Salmonella group. At present, more than 100 species of Salmonella are recognized. They are differentiated mainly by analysis of intricate antigenic patterns. S. derby is very closely related antigenically to the paratyphoid B bacillus and to many other species, the most common of which is S. typhimurium. They can be differentiated from each other only by means of special agglutinating serums with which the antigenic fractions may be identified.

As stated by Dr. Coughlin, S. derby was first recognized in 1923 by Peckham and Savage.1 It has been reported in the United States only within the last few years, probably because the serums necessary for differentiation of Salmonella were not available earlier. Edwards and Bruner2 recently reported the study of over 3,000 cultures of Salmonella isolated in the United States since 1934, 46 of which were identified as S. derby. These represent 33 outbreaks in fowls, 8 in swine, one in ruminants, and 2 in man. The 2 remaining strains were said to have been obtained from normal human beings. In the examination of specimens of meat from 58 retail markets in Kentucky, Cherry, Scherago, and Weaver<sup>1</sup> recently reported finding 8 species of Salmonella, mostly in pork products, from 13 markets. S. derby was isolated from 2 specimens, a hog's brain and a pork chop. This species has also been found in tissues of normal hogs in Germany' and South Americas and has been reported as the incitant of infections in young turkeys in Minnesota<sup>6</sup> and California.<sup>7</sup> In 1939, Hormaeche<sup>8</sup> reported its isolation from stools from 16 children in South America, at least some of whom had enteric disease. Bornstein and his coworkers in New York City' and Borman and his associates in Connecticut10 have identified 5 and 3 strains, respectively, of S. derby of human origin. In the Division of Laboratories and Research in Albany, 5 strains have been identified in addition to that inciting the outbreak described by Dr. Coughlin. These were from sporadic cases of gastroenteritis that have occurred during the past three years, and no information is available regarding the source of the infections.

Most of the Salmonella other than the paratyphoid A bacillus have been found in both animals and man and more frequently in the former than the latter. Although the paratyphoid B bacillus is usually regarded as a parasite of man, it has occasionally been reported in animals also. existence of chronic human carriers of paratyphoid A and B bacilli is an established fact. Other Salmonella have occasionally been isolated from stools of normal individuals and therefore human carriers must be recognized as a potential source of infection although epidemiologic studies seldom indicate transmission from person to person. The frequency with which various Salmonella have been found in tissues from apparently normal as well as diseased animals and birds suggests that they constitute the main reservoir.

# HEALTH SERVICE ORGANIZED FOR ECUADOR'S RUBBER AREA

Five dispensaries have been opened in northwest Ecuador for rubber workers, according to reports to the Institute of Inter-American Affairs, Washing-

Seventeen dispensaries now are operating in the Ecuadoran rubber area, through the cooperation of the Ecuadoran government and the Institute, which is an agency of the Office of the Coordinator of Inter-American Affairs.

Each dispensary is staffed by a physician trained in tropical disease control, usually assisted by a labomtory technician. Dr. Curtis E. Sauer, head of the Institute's medical section in the Ecuadoran area, reports that in one month 920 patients were treated in the dispensaries.

The new dispensaries are in Tena, Province of Napo-Pastaza; Concepcion, Province of Esmeral-das; and in Cojimines, Coaqui, and Jama, in the Province of Manabi.

"Practicantes" have been stationed at six rubber centers. The practicantes are specialized medical assistants who distribute medicine and administer minor treatment.—Release from the Office of the Coordinator of Inter-American Affairs

main line from the roof tanks, the other from the main leading to the basement suction tank. Ice water from the circulating system was not used in serving the two dinners.

The fire supply piping system is separate from the domestic supply and has no fixture connections to it.

Most of the fixtures below the second floor in the old building are supplied from the tanks on the fourteenth floor, whereas most of the fixtures below the second floor in the new building are fed directly from the supply main in the basement ahead of the filters.

There was a direct connection between the overflow pipe of the suction tank in the basement and a sewer which is subject to possible surcharging during storms. In the top of the tank was an open manhole through which pollution could be accidentally or willfully placed in the There were some six small pipe lines discharging into the tank, which delivered water which had passed through the cooling coils of either the ice machines or various engine cylinder heads. There was a direct connection between the sanitary sewer and the water supply that serves the air conditioning equipment in the subbasement. There was a hydraulic sewer ejector located in this sub-basement that had a direct connection with the water supply.

In the investigation 797 unsatisfactory connections through plumbing fixtures were found, including unprotected flushometer-operated toilets and lavatories and bathtubs with water inlets below the rim. In the case of a negative pressure developing, these fixtures constituted a

potential public health hazard. No unusual occurrence was known to have taken place prior to the outbreak of gastroenteritis which might have produced back siphonage. In order to determine whether or not negative pressures might develop during the normal operation of the hotel, vacuum and pressure recording gages were placed at several points on the eleventh and twelfth floors of the new building and on the top floor of the old building and recordings were made for two or three consecutive days in each location. In the new building the charts showed very small variations in pressure. The charts from the old building showed wide variations mostly in the nature of surge waves above the average pressure with no evidence of zero or negative pressure in either case.

It is believed that these results indicate that no back siphonage would be expected in this hotel under normal operating conditions. Unusual conditions such as large breaks near the base of any vertical riser or fire demand would undoubtedly produce partial vacuum in portions of the system affected by the unusual conditions. A partial vacuum might be created on the risers feeding the new building if the supply tanks were temporarily shut off for servicing or other reasons. However, none of these conditions was known to have taken place prior to the outbreak.

#### Conclusions

It will be seen that this outbreak presented an overabundance of clues, making a clear-cut solution of the problem most difficult if not impossible. Because of the scattered residences of those who were exposed, the investigation required the assistance of several district offices in New York State and fifteen city health departments located in five states. This resulted in a lack of uniform data for all persons exposed. It is believed, however, that the data presented constitute a fairly adequate sample of the whole.

From these data it would appear that the most reasonable conclusion is that the outbreak was caused by infection introduced into the chef's salad and possibly other foods by the food handler who was a temporary carrier of the organism.

# Summary

- 1. A hotel outbreak of gastroenteritis consisting of 83 cases including 70 of the 78 persons attending a college alumni dinner and 10 of 19 attending an insurance company's dinner, 2 members of the hotel staff, and a guest at the hotel.
- 2. The causative organism, Salmonella derby, was first reported in 1923 as the cause of an outbreak of gastroenteritis due to the eating of pork pie in Derby, England, and has been found in isolated cases since that time, but as far as is known had not been responsible for an outbreak in this country.
- 3. Although many unsatisfactory conditions in the arrangement of the plumbing and in the plumbing fixtures created potential public health hazards, there is no evidence that any backsiphonage did actually occur in connection with this outbreak.
- 4. It seems probable that infection was due to cher's salad and possibly other food handled by a food handler who was a transient carrier of Salmonella derby.\*

Degen, Jr., now in England, who assisted in the investigation, to the District Health Officers, the staff of the Division of Communicable Diseases, Division of Sanitation, and the Division of Laboratories and Research of the State Department of Health, and the several local and state health officials who contributed to the investigation.

mode. Some must be immobilized by casts or traction, some are stuporous, or prostrated by shock, fever, or anemia. Except in the moribund, these latter states rarely last more than a few days. Thousands are confined to absolute bed rest, not by necessity or choice, but by the doctor's orders.

More vividly than others, the pathologist is aware of the cost in lives of this form of therapy. In the last 300 autopsies on adults in this hospital 15, or 5 per cent, died of pulmonary embolism secondary to thrombi in the legs or pelvis. At the San Francisco Hospital, Westdahl demonstrated such pulmonary emboli in 13 per cent of the autopsies, and in 3.5 per cent they were the immediate cause of death. In another 3 per cent there were pulmonary emboli from other sources, such as the right auricle or axilla.

Pulmonary embolism is very rare in ambulatory patients, or even in those who lead wheelchair lives. Even with heart disease or varicose veins and hemorrhoids, pulmonary emboli are rare as long as the patients are ambulatory, even though thrombosis of the veins occurs. Those who treat varices by thrombosis have learned not to put the patients to bed.

Swiss and German pathologists have given us excellent data on the etiology of these accidents and their relation to bed rest. Autopsies with complete leg dissections show that 30 per cent of all hospital cases, ages 17 to 90 years, have thrombi in the veins of the calf; in adults who have been in bed two weeks or longer the incidence reaches 60 per cent, while nearly all show necroses and inflammatory reaction in the calf muscles, which apparently initiate the process. In 10 per cent thrombi are found only in the veins of the foot, and none are ever found in the dorsum of the foot. Only 2 per cent have thrombi in the hypogastric or iliac veins without clots in the legs. The incidence of thrombi goes up with age, doubling after 40, and again after 60.

Thrombi, if unilateral, are twice as common in the right calf or thigh as the left, and 30 per cent more often in the right foot. This is presumably because people in bed tend to spend more time lying on the right side than the left. Pulmonary emboli, however, come from the left femoral vein as often as from the right, and from the left iliac ten times more often than from the right. This means that propagation into the iliac vein and formation of emboli are very high on the left side in relation to the total number of thrombi formed. Perhaps the fact that the right iliac, unlike the left, does not pass behind the iline artery has comething to do with this. Pulsations coming down the vena cava may be blocked where the artery compresses the left iliac vein, thus leading to a quieter flow and less movement of the wall when we are recumbent.

At the New York Hospital about as many people die of massive pulmonary embolism as of cancer of the stomach or of bacterial endocarditis. There is not a shadow of doubt that these deaths are due to a therapeutic measure—complete bed rest. Other deaths, probably equalling these dramatic ones in number, follow bed rest as indirect sequelae, bronchopneumonia being the most common sequel.

While bed rest has little hazard to life in child-hood, it becomes increasingly dangerous with advancing years. Absolute bed rest kills more patients than anesthesia and all the drugs in the pharmacopoeia added together. Obviously such a hazardous agent must be used only for precise indications, and then its value should be weighed against its risks. The necessary measures to be taken to diminish the morbidity and mortality of those who really must have bed rest are also of great importance, and perhaps one of these exercises will be devoted to their discussion; at this conference only the hazards and the indications are under scrutiny.

What do we expect to accomplish therapeutically by bed rest prescribed for people who are not comatose or prostrated? The effect of absolute bed rest, as compared with rest combined with sitting up and using a commode, seems not to have been studied. It does not significantly reduce the calories liberated per day. It does not reduce the total cardiac output, which may be higher when the patient is recumbent than when he is sitting or standing. Effects on blood pressure and pulse rate are negligible. Thoracic breathing and cough may be increased by sitting up, and these are matters of importance in some phases of pulmonary tuberculosis. One wonders whether this possible effect is not outweighed in the afebrile cases by the improvement in morale, appetite, and the muscle and vasomotor tone which results if the patient can sit up for some meals and for half an hour or more twice a day.

In cardiac cases, both of myocardial infarction and congestive failure, pulmonary emboli are very frequent. It is well known that people with heart failure are more comfortable sitting than lying, as are most asthmatic patients. There is evidence that the circulatory burden is least and respiration is easiest when they sit and lean forward. The anatomic and physiologic basis for this is quite obvious, and sitting probably diminishes pulmonary edema and the formation of pleural fluid. It is far more work to stay propped up in bed than in a chair, and these cases usually are most comfortable with a table to lean on. Edema of the legs will accumulate in

# Therapeutics

# CONFERENCES ON THERAPY

THESE are stenographic reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. The next report will appear in the May I issue and will concern "Chemotherapy of Infections of the Urinary Tract,"

### Use and Abuse of Bed Rest

Dr. Harry Gold: The subject of the conference today is "The Use and Abuse of Bed Rest."

Most therapeutic measures are double-edged swords. They can do harm as well as good. One hardly ever thinks of using a drug without some consideration of its dangers. This applies not only to drugs but also to radiation therapy and physical therapy.

But the bed as a therapeutic device, as a means of providing rest, is usually taken for granted. We often debate the question whether or not the patient will profit by going to bed, but the decision as a rule does not consider the dangers of going to bed.

The conference today is planned to point out the necessity of weighing carefully in every case the possible advantages of the bed as a means of securing rest against its disadvantages. The implication is that many conditions now treated with bed rest could be better treated in other ways.

Prolonged confinement to bed comes into direct conflict with physiologic conditioning. We all know that confining a patient to bed creates problems. The effect on the morale is not the least important one. The patient in bed who says, "I look longingly at that chair," touches on the fundamental issue. There are gastro-intestinal problems, constipation, distention, and the serious issue of the bedpan. Genitourinary disturbances are common: urinary retention, the difficulty that many patients have voiding in bed. There are orthopaedic back aches and muscle cramps which arise from abnormal pressure when the patient is in bed. Pulmonary disorders occur, especially hypostatic congestion of the lungs. There are circulatory problems. The latter are particularly noteworthy in patients with failure of the left side of the heart. The doctor sometimes finds the patient sitting in a chair. Too often he puts him to bed, whereupon the patient proceeds to suffocate.

Dr. Dock is going to open the discussion with

some of his observations relating, I believe, chiefly to the dangers of rest in bed.

Dr. William Dock: Man's perversions from normal mammalian or even simian behavior make him the scandal of the biologic world. He not only walks erect like birds and the anthropoids, but continues to drink milk all his life, to eat eggs, and to make love at all seasons. He uses drugs such as nicotine and caffeine daily, alcohol and cathartics almost as often, and sometimes to great excess. In the past century he has outdone himself with new perversions. He has increased his maximum velocity of movement from 18 miles an hour to 60 and then to 500, the hazard increasing roughly as the cube of the velocity. He has taken to living and working on mountain tops and deserts; he rises to heights where the barometric pressure is one-fifth normal, and dives to depths where it is ten times normal. Unlike all other mammals, man sleeps on his back, and lies recumbent when ill. Until the Florence Nightingale era the sick usually got up several times daily for elimination, if not for meals; but, thanks to nursing progress, thousands of people now lie recumbent, at absolute bed rest, for days, weeks, or months. As with all the other perversions from biologic normality, this too must be paid for by discomfort, invalidism, and death.

Bed rest robs the bones of chalk, as it causes an immediate, severe, negative calcium balance. It greatly weakens vasomotor tone and wastes the voluntary muscles. It causes hyperemia, edema, and collapse of the dorsal parts of the lungs. It predisposes to ulcers of the skin and to hypostatic pneumonia. In elderly men it often precipitates severe symptoms of prostatism, and it is a notorious background for many cases of cathartic habituation. The effects on the psyche of this unnatural way of life are noted even by laymen like Tolstoi, Henry Adams, and Balzac.

Few patients are so ill that they prefer bed rest to sitting in a comfortable chair; fewer still prefer the urinal and bedpan to the bedside com-

Dr. Dock: It is effective but hazardous.

Dr. Wolff: In the case of a person with a vascular accident in the head there is no reason why the person should not be allowed to get up if he has the will. Indeed, in older persons it is a great menace to keep the patient in bed one hour longer than necessary.

Another aspect has to do with head injuries. I used to teach that a man ought to stay in bed for a week for every hour of unconsciousness that he sustained following a blow on the head. The slogan in textbooks is, "Lucky is the man who breaks his leg when he breaks his head," the implication being that we ought to keep him in bed long enough to allow him to recover from the awful shock. As a matter of fact we know patients who have been kept in bed eight, nine, or ten weeks and then have had a very hard time adjusting themselves to the upright position, both physiologically and symbolically. They have a hard job getting back to work.

The practice in the Army and Navy at present is to get a man on his feet just as soon as possible following a head injury; that is, when he expresses the inclination. The results are far better with regard to the posttraumatic sequelae, the dizziness, and the confusion states that used to be common after prolonged bed rest.

I certainly subscribe to everything that Dr. Dock has said today.

Dr. Janet Travell: It has been reported that 10 per cent of cases with acute coronary thrombosis develop a painful or frozen shoulder syndrome. This complication is apparently due to spasm of the skeletal muscles, since it responds to local infiltration of the affected muscles with procaine, just as it does in cases without demonstrable heart disease. It is likely that one of the most important factors in the development of this syndrome is the complete immobilization of the shoulders which is usually enforced in the patient with an acute cardiac infarct who is confined flat on his back in bed. I believe that regular, gentle, active motion of the upper extremities would do much to prevent the appearance of muscle spasm and pain in these cases.

VISITOR: I should like to ask Dr. Dock whether this has not been his experience: that bed rest hazards apply particularly to people with some circulatory deficiency.

Dr. Dock: Most surgical patients do not have circulatory deficiency.

VISITOR: In surgical cases the trauma or perhaps the anesthesia might be related to it.

Dr. Dock: I think it is not so much anesthesia as the profound narcosis induced with morphine. Because of the pain and the sedation surgical patients lie like logs. I think that is the reason they get into trouble.

Two per cent of the women with breast amputations have emboli from their legs. That operation is a pretty long way off from the legs and there cannot even be a question of immobilizing the leg from pain. There is no pain in the belly or leg from mastectomies. It is just that those women are given morphine and kept very quiet, and that permits the emboli to form. It has less to do with the type of operation than with how quiet the patient is kept after it. Most patients are kept very still for some time and the result is that hernias and appendectomies supply the vast majority of emboli.

Visitor: It is my impression that in tuberculosis thrombophlebitis and pulmonary emboli are quite unusual except in the very ill, very toxic patients, and in the more or less terminal

Dr. Dock: Five per cent of emboli in medical cases were in tuberculous patients. Those were almost all fatal. It is true that tuberculosis patients are usually under 50, which is all in their favor, and quite a lot of them are fairly restless in bed. Those not desperately ill like to read and keep very active so that sand bags are used to keep them quiet. I think they have a better outlook than the patients who are kept under deep narcosis and sedation.

Dr. Wolff: It is customary to put a man with detached retina on his back for at least several weeks. Do you think that is necessary?

DR. JOHN M. McLean: It is necessary to maintain the static position of the eye, but it is not necessary to fix the rest of the body. There is no way surgically to suture or otherwise solidly fasten the retina to the choroid underneath. The best thing to do is to take areas of adhesive choroiditis and so place the retina that it will lie in contact until enough healing has taken place for the two to be scarred together. If the position of the head or the eye is changed, the retina will fall or float off again.

Dr. Wolff: Merely nodding or wagging the head will do that?

Dr. McLean: That will do it. But almost any kind of motion with the arms and legs will do no harm. In institutions like this one, where we try to avoid immobilization (and it can be done with the proper suturing, proper bandaging, and proper care) these are almost unheard-of complications.

The incidence of trouble in our eye cases was very low. It is true that many of the patients were old, but pulmonary emboli were nevertheless not common. I think that pneumonia, too, was rare.

DR. GOLD: You may be interested in some figures that Dr. Berger gathered for us from a group of 1,500 ambulant cardiac patients in our

many while they are sitting, which then must be permitted only for short periods unless required for obvious relief of dyspnea. Straining during urination or defecation is often greatly diminished if the patient can sit up, and such straining is a very real hazard. To avoid it the patient must be taught not to close his mouth or glottis while changing posture or emptying the bladder or bowel.

In many places it is the custom, whenever the diagnosis of myocardial infarct is made, to order the patient to bed for six weeks. Such a custom is almost as illogical as the bleedings and purgings of previous generations. If a patient is afebrile, and if he enjoys sitting up, there is no physiologic basis for having him lie in the most unphysiologic posture known—namely, the recumbent—for six weeks. No one seems to have shown whether or not fewer arrythmias, ruptures of the heart, secondary myocardial infarcts, or aneurysms of the heart occur with this conventional therapy than with one guided by physiologic principles and common sense.

In men over 50 I know that there are more complications due to absolute bed rest, and more deaths due to pulmonary embolism under the conventional scheme, than can possibly be ascribed to exercise, even in those patients who never go to bed or who go back to work as soon as the initial bout of pain and fever has subsided. I see no reason why patients with coronary disease should not sit up if they feel more comfortable doing so.

Since pulmonary emboli are notoriously common in those torpid and obese or senile people who lie in bed like logs rather than toss about as normal people do, some must actually be ordered to get up. It must be remembered that some patients with angina have attacks chiefly when recumbent. When sitting up leads to accumulation of much edema in the legs, it may also predispose to such attacks or to pulmonary edema when the fluid shifts back into the blood stream on lying down, and when night brings on its normal antidiuresis, acidosis, fall in blood pressure, and possibly in coronary flow. In these cases the longest periods of sitting should be in the morning.

In surgery the duration of absolute bed rest after many operations depends on how tight the suture line is. Wounds burst open on coughing or retching; they may burst open on standing, but I think this is an argument for advances in suture and bandage technic rather than a reason for keeping a patient lying flat for more than two or three days. Fatalities after elective surgery, such as hernioplasty, are particularly tragic. Some surgeons who create a terrible uproar if a patient dies of wound tetanus accept pulmonary

emboli with the same holy resignation with which their forefathers accepted laudable pus. I am quite confident that the future will deal with such inertia and disrespect for the Almighty as contemptuously as we do with those who regard tetanus and suppuration as mysterious manifestations of the will of God.

The recumbent posture is unphysiologic; it is, when long maintained, hazardous to the psyche, the physical well-being, and even the lives of adult patients. Since it is widely used, it claims more lives than all other therapeutic agents put together. It must be thoughtfully applied, promptly discontinued when no longer necessary, and its application must be supervised with meticulous attention to its hazards.

Dr. Harold Wolff: Dr. Dock, suppose one were put to bed for a prolonged period; is there anything you would suggest to make the adjustment back to the upright position less dangerous?

Dr. Dock: Supposing that thrombi had formed, how would you go about getting the patient up? I don't think it is simply getting up which precipitates an embolus. Anything that raises the venous pressure in the lower part of the body may do it. The Valsalva's experiment will do it very nicely. Sitting up is just another way of raising the venous pressure. If you raise the venous pressure after it has been low for a long time you suddenly expand the wall of the vein, and peel the thrombus loose. If the thrombus is not firmly attached, there is not much you can do about it. The first time the venous pressure goes high it may be stripped off.

Prophylaxis seems to me to be entirely a question of management of the patient while he is lying down rather than of trying to avoid the unavoidable situation in which the venous pressure of the legs is precipitately raised. Whether that occurs with straining on the bedpan or occurs the first time one sits up does not matter much.

DR. Gold: Dr. Dock, what do you think about the routine treatment of patients who have to lie in bed for a long period of time, with anticoagulants like dicoumarin?

DR. DOCK: I think it is most unphysiologic treatment to have the patient lie in bed for a long time and then on top of it to stop the coagulation mechanism. It is adding one insult to another. It may have some prophylactic value but the hazards of being without the clotting mechanism are obvious. I personally would prefer some more physiologic method for preventing the forming of clots, rather than the use of anticoagulants.

Dr. Gold: I was thinking of patients for whom lying in bed is imperative.

Dr. Dock: It is effective but hazardous.

Dr. Wolff: In the case of a person with a vascular accident in the head there is no reason why the person should not be allowed to get up if he has the will. Indeed, in older persons it is a great menace to keep the patient in bed one hour longer than necessary.

Another aspect has to do with head injuries. I used to teach that a man ought to stay in bed for a week for every hour of unconsciousness that he sustained following a blow on the head. The slogan in textbooks is, "Lucky is the man who breaks his leg when he breaks his head," the implication being that we ought to keep him in bed long enough to allow him to recover from the awful shock. As a matter of fact we know patients who have been kept in bed eight, nine, or ten weeks and then have had a very hard time adjusting themselves to the upright position, both physiologically and symbolically. They have a hard job getting back to work.

The practice in the Army and Navy at present is to get a man on his feet just as soon as possible following a head injury; that is, when he expresses the inclination. The results are far better with regard to the posttraumatic sequelae, the dizziness, and the confusion states that used to be common after prolonged bed rest.

I certainly subscribe to everything that Dr.

Dock has said today.

Dr. Janet Travell: It has been reported that 10 per cent of cases with acute coronary thrombosis develop a painful or frozen shoulder syndrome. This complication is apparently due to spasm of the skeletal muscles, since it responds to local infiltration of the affected muscles with procaine, just as it does in cases without demonstrable heart disease. It is likely that one of the most important factors in the development of this syndrome is the complete immobilization of the shoulders which is usually enforced in the patient with an acute cardiac infarct who is confined flat on his back in bed. I believe that regular, gentle, active motion of the upper extremities would do much to prevent the appearance of muscle spasm and pain in these cases.

VISITOR: I should like to ask Dr. Dock whether this has not been his experience: that bed rest hazards apply particularly to people with con-

with some circulatory deficiency.

Dr. Dock: Most surgical patients do not have circulatory deficiency.

VISITOR: In surgical cases the trauma or perhaps the anesthesia might be related to it.

Dr. Dock: I think it is not so much anesthesia as the profound narcosis induced with morphine. Because of the pain and the sedation surgical patients lie like logs. I think that is the reason they get into trouble.

Two per cent of the women with breast amputations have emboli from their legs. That operation is a pretty long way off from the legs and there cannot even be a question of immobilizing the leg from pain. There is no pain in the belly or leg from mastectomies. It is just that those women are given morphine and kept very quiet, and that permits the emboli to form. It has less to do with the type of operation than with how quiet the patient is kept after it. Most patients are kept very still for some time and the result is that hernias and appendectomies supply the vast majority of emboli.

VISITOR: It is my impression that in tuberculosis thrombophlebitis and pulmonary emboli are quite unusual except in the very ill, very toxic patients, and in the more or less terminal cases.

Dr. Dock: Five per cent of emboli in medical cases were in tuberculous patients. Those were almost all fatal. It is true that tuberculosis patients are usually under 50, which is all in their favor, and quite a lot of them are fairly restless in bed. Those not desperately ill like to read and keep very active so that sand bags are used to keep them quiet. I think they have a better outlook than the patients who are kept under deep narcosis and sedation.

Dr. Wolff: It is customary to put a man with detached retina on his back for at least several

weeks. Do you think that is necessary?

Dr. John M. McLean: It is necessary to maintain the static position of the eye, but it is not necessary to fix the rest of the body. There is no way surgically to suture or otherwise solidly fasten the retina to the choroid underneath. The best thing to do is to take areas of adhesive choroiditis and so place the retina that it will lie in contact until enough healing has taken place for the two to be scarred together. If the position of the head or the eye is changed, the retina will fall or float off again.

Dr. Wolff: Merely nodding or wagging the head will do that?

Dr. McLean: That will do it. But almost any kind of motion with the arms and legs will do no harm. In institutions like this one, where we try to avoid immobilization (and it can be done with the proper suturing, proper bandaging, and proper care) these are almost unheard-of complications.

The incidence of trouble in our eye cases was very low. It is true that many of the patients were old, but pulmonary emboli were nevertheless not common. I think that pneumonia, too, was rare.

Dr. Gold: You may be interested in some figures that Dr. Berger gathered for us from a group of 1,500 ambulant cardiac patients in our

clinics. Ten per cent of the group, or 150 of them, had auricular fibrillation. In one year in the latter group we encountered fourteen vascular accidents. Nine were on the arterial side; most of them were in the brain, and of these nine, five occurred while the patients were up and about, and four while they were in bed. Whether these patients were in bed or up and about did not seem to matter. We had 5 cases of pulmonary embolus. All of these were in patients who were in bed at the time and for periods of eight, fourteen, twenty-one, twenty-eight, and thirty-three days, respectively. There was not a single pulmonary accident among the remainder of the 1,500 patients in one year.

Dr. Dock: How many of the total were put to bed?

Dr. Gold: I don't have that figure, but there were 150 patients with auricular fibrillation who were ambulant. Some of those were sent to bed from time to time for special observation. Five cases of pulmonary embolus were encountered in a year, and they all occurred when the patients were in bed and not when they were up and about. It is noteworthy that these patients were in bed for special observation, not because they were so ill as to require confinement to bed, although there may be some relationship between the severity of circulatory failure and the tendency to thrombosis.

Dr. McKeen Cattell: I should like to ask what can be done in the way of physical therapy to counteract the effects of bed rest? That would seem to be a golden opportunity for the

physiotherapist.

Dr. Dock: Something certainly has to be done about the legs. Apparently the main problem is to keep the weight of the legs from pressing on the calves and thigh muscles for any long periods day after day. That seems to be the source of a good deal of the difficulty. If the patients themselves would do regular exercises with the legs and change positions often, I think it would diminish the incidence of that sort of trouble.

I don't believe occasional massage would make much difference.

DR. C. H. WHEELER: How much difference do you think it would make to employ the Trendelenburg position for bed rest instead of the horizontal?

Dr. Dock: I think if the legs are propped up there still is pressure on the calf muscles.

DR. WHEELER: Would the lower venous

pressure help?

DR. DOCK: Keeping the venous pressure low is one of the things that leads to trouble. The caliber of the veins is very small. Clots begin to form and propagate, especially if the venous

caliber is small and constant. The reason people in wheel chairs do so well is because they do not compress the calves and constantly change the pressure points on the thighs and buttocks. They have distended veins in the legs, just as we all do part of each day. That is not such a serious business as having pressure on the muscles for long periods of time and a constant low venous pressure in the legs.

DR. WHEELER: Don't you think the velocity of the blood flow has something to do with it?

Dr. Dock: I think it is perfectly obvious that if you raise the velocity of flow in the legs to a maximal level every three or four hours, no large emboli could possibly come from the legs. You might get little thrombi, but when this tremendous flow comes along the little thrombi are washed loose.

The easiest way to increase the blood flow is to induce reactive hyperemia by obstructing the flow for five minutes every four hours. This would give twenty minutes of intense blood flow through all veins in the lower extremity. Reactive hyperemia would be more effective that passive exercise.

DR. WOLFF: Dr. Shorr, it is my understandin that men who are injured with gunshot wounds etc., who have broken bones and are put to be often get kidney stones because of the calcinumi that follows the bed rest.

DR. EPHRAIM SHORR: The increase in calciun excretion under these conditions is perfectly enormous and it cannot be influenced by diet Putting such patients on calcium-free diet results in no diminution whatsoever from a leve of 300 to 400 per cent of the basal calcium excretion. The factors which hold calcium in solution are not correspondingly altered.

Thus a very favorable situation exists for the production of renal stones. At the same time, as Dr. Dock pointed out, bed rest is an active mechanism for depriving the rest of the bony skeleton of calcium. It is encouraging that this is recognized, and in the Army, as well as in civilian life, most alert surgeons have the patient made ambulatory as fast as possible. Some of the British surgeons think this may be overdone, in that there is a tendency for the bones to separate and delay healing. Certainly the tendency in the past has been in the other direction; there has been insufficient awareness of the calcinuria, with loss of calcium from the skeleton. Sometimes this situation is unavoidable and measures have to be instituted to deal with it in cases in which prolonged bed rest is necessary.

I should like to comment on what one might learn from the natural phenomena of sleep as compared to what happens to a patient who has been given morphine after operation. Some

experiments on sleep were carried out at the Mellon Institute a number of years ago. results were startling. Thus, restful sleep occurred when the subject moved quite frequently during the night. The type of sleep in which, for some reason, such as experimental stupor or unusual fatigue, the subject hardly moved, was not usually followed by the sense of refreshment in the morning. The business of moving the legs about every seven minutes or so, as many of the normal subjects do, may not only relate to the maintenance of vascular flow but also to the carrying away of products, such as lactic acid, which might accumulate in muscle and which, if long continued, might lead to mild degenerative changes. I was very much impressed with these studies of the restfulness of restless sleep.

VISITOR: I should like to ask Dr. Dock a question. In Germany there was the belief that in the last two decades an actual increase occurred in the number of patients with pulmonary embolism found at autopsy as compared with the first decade of the century. I think that in the early nineteen-thirties it increased from about 1/2 to 1 per cent to about 5 per cent. Is there any explanation for that?

Dr. Dock: I don't know how much of that might be due to better nursing care. The German continental nursing care is not nearly so protective and maternal as in this country, and the number of patients who get complete bed rest was much smaller on the German wards than on ours. Perhaps they are catching up and keeping the patient in the cocoon-like stage. This increase might have been due to a change in diet or in sedation.

SAME VISITOR: Perhaps it had something to do with the increased use of intravenous medication?

Dr. Dock: That would only apply in the arms, and these things all come from the legs.

An interesting observation comes from Dr. Snapper of the Peking Medical School. Such accidents are practically unknown in their hospital. They have excellent nursing care, but pulmonary emboli and phlebitis are quite rare. They think it is a question of diet, perhaps something to do with the high intake of unsaturated fatty acids.

Dr. Wolff: There are certain difficulties in tabes. Patients with tabes are very seriously affected by being put to bed. A man having his eye treated, which is supposed to take two weeks, and who has trouble with his posterior column, may not be able to walk at all after that. Similarly, patients with multiple sclerosis who have trouble with their position sense may have a lot of trouble in walking after a few weeks in bed.

STUDENT: I should like to ask Dr. Dock if there is any relation between typhoid fever and the formation of thrombi?

Dr. Dock: There are two schools of thought on thrombi in typhoid. Dr. Connor felt that special care to the legs of the typhoid patient did not reduce the incidence, whereas Clifford Albutt in his final years said that when he was a young man he got the percentage down to 8 per cent by special attention, moving the legs, and special exercises.

Usually for a considerable part of the time the typhoid patient is in a prostrate stage, when getting up is more or less out of the question. The question is how to prevent embolic accidents.

Dr. Shorn: I think attention should be called to the work of Dr. DuBois with respect to the energy cost of sitting in a comfortable chair as against that of lying flat in bed. He found no significant difference. His results do not support the need for the flat position.

Dr. Gold: You may be interested to know that I looked through five well-known textbooks on therapeutics for discussions of bed rest and all that I could find was that it is quite essential in many conditions. The dangers were not mentioned.

DR. MUSCHENHEIM: There is just one comment that I should like to make. Dr. Dock implied that perhaps too much bed rest was given to the tuberculous patients throughout the country. Of course, the opinion of most of the tuberculosis workers is quite the opposite—that not nearly enough bed rest is given the tuberculous patients on the average. That is perhaps a separate subject from the hazards of bed rest, but certainly the opinion is growing that more strict bed rest is indicated, even for the early tuberculosis cases.

#### Summary

Dr. Gold: When a person is very ill he goes to bed. If he doesn't do so himself, the doctor orders him to bed. In the face of the fact that this practice is so universal and seems so natural its wisdom is rarely questioned. The development of the profession of nursing has helped to apply a new rule in the program of bed rest; namely, absolute quiet, and the widespread use of hypnotics and narcotics has gone a long way to enforce it. The patient lying flat in bed, guarded against his will to move, by nurse and drug, has become a familiar figure.

In the conference this afternoon he is described as a person treated by a method which endangers his life and which fails to offer sufficient compensation for the risk.

The discussions seem to have shaken the solid

foundations of bed rest as a therapeutic measure. It was pointed out that as a means of securing absolute rest lying in the bed is sometimes inferior to sitting quietly in a chair, for many patients are much more restless in bed than they are in a chair. The energy exchange of the patient while sitting in a chair is not materially higher than it is when he is lying in bed, as shown by the basal metabolic rate. Lying in bed, furthermore, involves unphysiologic postures and adjustments which give rise to many disturbances. It leads to constipation, distention, urinary retention, prostatism, impairment of appetite, bed sores, loss of muscle tone with wasting, cramps, persistent muscle spasm, and loss of calcium from the skeleton with calcinuria and renal stones. Not the least important of its unfavorable effects is the depression of morale. The bedpan is a source of discomfort and annoyance, and straining on the bedpan sometimes proves disastrous. The use of the commode often involves much less energy and less danger. Another serious consequence of lying flat in bed occurs in failure of the left side of the heart, in which the greater filling of the heart promotes edema of the lungs. In elderly persons especially, it leads to pulmonary congestion and hypostatic pneumonia. Protracted bed rest prolongs the period of convalescence and makes more difficult the final adjustment to an erect posture and a normal mode of life.

There is a more serious consequence of bed rest; namely, pulmonary embolism. This results from the compression of the veins in the calves of the legs, slowing the venous circulation, with resulting thrombosis. It is noteworthy that more than half of the adult patients who have been in bed two weeks or longer develop thrombi in the veins of the calf. A sudden movement which increases the venous pressure and the pulsation of the vein liberates a thrombus and results in pulmonary embolus which is sometimes

The autopsy material in this institution reveals that this factor arising from bed rest is a more frequent cause of death than many serious ailments and all the drugs combined.

There are, of course; many situations in which bed rest may be essential, such as pulmonary tuberculosis, acute prostration and shock, and after certain operative procedures. It is pointed out, however, that many conditions in which it is commonly regarded as essential may be more satisfactorily treated with the patient for the most part sitting in a comfortable chair. Special mention was made of the traditional confinement of the patient with coronary thrombosis for a period of six weeks in bed. There seems to be a great deal of doubt that this is necessary, as well as a belief that greater freedom of motion and sitting in a chair, except possibly for the most acute phase of the disorder, would materially improve the treatment of this condition.

What this conference has stressed is the fact that not sufficient thought is generally given to the bed system of securing rest, and if a decision concerning the use of bed rest will be based upon such considerations as have been discussed, an important advance in treatment is likely to fol-

More patients will be treated almost from the beginning of their illness to its end by comfortable rest in a chair rather than by debilitating rest in bed. The patient's preference and comfort will play an important part in the decision. Much more often will the commode take the place of the bedpan. Patients who need to be confined to bed will be encouraged to move with reasonable frequency in order to avoid the formation of thrombi in the veins of the legs. Less depressant medication will be used. The morbidity from protracted illness will be reduced. The convalescence from protracted illness will be shortened. The mortality from bed rest alone will be largely eliminated.

# A.M.A. COMMITTEE ACTS TO SOLVE PROBLEMS OF POSTWAR MEDICAL CARE

Three moves aimed at solving two of the most important problems in providing a better postwar distribution of medical care—a wider and more appropriate distribution of hospital and diagnostic facilities and an efficient means for providing for the location and relocation of physicians in the postwar period, have been made by the Committee on Postwar Medical Service of the American Medical Association, the Journal of the Association reports in its February 12 issue.

At a recent meeting of the Committee it was voted to recommend to the Board of Trustees of the Association that the Board look into the desirability of establishing an agency for disseminating information on the location or relocation of physicians in the postwar period.

The report points out that "Inasmuch as a wider and more appropriate distribution of hospital and diagnostic facilities would influence decisively a satisfactory location or relocation in the postwar period, the Subcommittee on Location and Relocation . . . . was authorized to explore the subject of hospital and diagnostic facilities and the extension thereof as an effective measure in the better distri-bution of medical care."

In its third move the Committee authorized the sending out of a sample, or pilot, questionnaire of 3,000 copies to physicians in the armed forces. The purpose of the pilot questionnaire is to determine the best form of inquiry as to the probable nature of postwar needs of large numbers of physicians in military and governmental service.

# Case Report

#### MEDIASTINAL LYMPHOSARCOMA

Report of a Case Under Roentgen Therapy for More Than Ten Years

E. B. BILCHICK, M.D., and A. W. JACOBS, M.D., New York City

T.P., AGED 39, married, a housewife, Italian by birth, was first seen by Dr. Bilchick in October, 1931, because of pain in the chest and cough, with some loss of weight, which had lasted one year. The patient had been married eleven years but had no children. Her menstrual history was regular. Her past history was irrelevant. Family history was not significant. Physical examination at this time revealed dullness in the right chest anteriorly and some dullness posteriorly in the upper half of the chest. Tests of the ears, nose, throat, and sinuses gave negative results. The tonsils were small and gave negative results. The tonsils were small were not infected. The larynx was normal. masses or signs of infection could be found in the neck or upper respiratory region. X-rays of the chest were advised but the patient refused to have them taken. A cough mixture was prescribed. The patient was not seen again until March 1, 1932, when she reported to Dr. Bilchick with a further history of loss of weight and a cough; in addition she had anorexia, some difficulty in swallowing, and swelling in the right side of the neck, which had been increasing in size for several months. Examination at this time showed the following:

Ears, nose, throat, tonsils, and sinuses were nega-

tive; the larynx was negative.

The general condition of the patient was good.
In both sides of the neck, extending from the supraclavicular region up to the ear on the right and to the middle of the cervical region on the left, were masses of glands which were very firm, not fluctuant or tender. The right upper field was flat to percussion anteriorly and posteriorly, with diminished breath sounds.

Blood examination showed a normal count, with no eosinophilia and very slight anemia. No abdominal masses were palpable, nor could the liver or spleen be felt, nor was there any general glandular

adenopathy.

Report on the roentgenograms of the chest was as follows: heart: normal; lungs—right, a large welldefined, rounded, homogeneous, dense shadow practically filled the upper two-thirds of the lung field. Its base appeared to be in the mediastinum. lower third of the lung field was clear; left-clear. There was a definite, lobulated shadow in the region of the lung root, which was of similar density and appeared to be continuous with the shadow in the right chest. This apparent continuity of the shadow was best seen in the upper portion of the chest. The tumor in this region appeared to encase the base of the heart. Costophrenic sinuses—clear; trachea—in midline. There was a slight but definite present of the level of the nite pressure defect on the right side at the level of the seventh cervical to the second dorsal spine; disphragm-smooth contour, good excursion; ribs-

Diagnosis: mediastinal neoplasm.

Biopsy of the cervical mass was advised, but the patient refused. The patient was referred to Dr.

Jacobs for radiation therapy on March 3, 1932. Physical findings were confirmed at this time. Deep roentgen therapy was administered to the anterior mediastinum and supraclavicular regions and posteriorly to the mediastinum. sisted of 1,200 r to each portal in divided doses of 200 r at each treatment from March 3, 1932, to April 9, 1932. This was followed by regression of the masses in the supraclavicular regions, gain in weight, improvement in general condition, and ab-

sence of symptoms.

On April 11, 1933, about one year later, the patient appeared for examination. She had gained in weight, but complained of some pain in the anterior chest and a slight cough. Examination revealed moderate swelling in the right supraclavicular region and numerous palpable glands in both supraclavicular regions, more on the right side. Roentgen therapy to the right supraclavicular region, anterior mediastinum, and posterior mediastinum, consisting of 1,200 r to each was resumed in divided doses, from April 11, 1933, to May 26, 1933, after which there was complete regression of the swellings and glands. During the latter part of 1934 and the early part of 1935, 1,200 r were again administered to the anterior and posterior mediastinum. During the early months of 1937, 800 r were given to the anterior mediastinum and 1,200 r again during the latter part of 1937. In April, 1939, the patient complained of cough with mucoid expectoration, pains in the chest, anorexia, loss of 15 pounds in weight in three months, and choking sensations, with some dyspnea on exertion. During the latter part of 1939, roentgen therapy was given to the anterior chest consisting of 1,600 r. On March 27, 1941, the patient complained of pains in the anterior part of chest, cough with expectoration which was bloodtinged at times, and dyspnea on exertion. Over a period of six weeks 1,200 r were given to the anterior chest. This was repeated about three months later.

Throughout this time, physical examination was checked by both the authors. No findings outside of the chest were observed. The patient, in spite of her complaints, looked well and was able to do her housework and even to help her husband in a small shop. However, on January 9, 1942, she complained of sudden attacks of marked dyspnea, weak spells, and fear of serious consequences. These occurred at intervals of one to two weeks. It was felt that the symptoms were due to pressure on the trachea and vagus nerves and branches. In February, 1942, hospitalization was advised to permit observation and any emergency surgical procedure that might

be necessary.

The patient was admitted to Morrisania Hospital on February 5, 1942. Her age was now 52. Examination at this time showed no findings except for the chest condition. Her blood count was normal. Fluoroscopic examination and x-rays with barium in the esophagus showed the esophagus to be nor-

Fig. 1. Before treatment—March 1, 1932

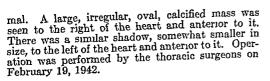

Fig. 2. Six weeks after treatment

Fig. 4. Nine and one-half years after treatment

A transverse incision was made over the right second space. The second and third costal cartilages were cut and the internal mammary artery was ligated. The intercostal muscle and pleura were cut and the chest was opened. A large, lobulated, stony, hard mass was found behind the heart and

great vessels and in front of the esophagus. This was densely adherent and resisted dissection. At one point when the mass had been almost completely freed, sudden sharp bleeding occurred from a vessel above the mass. This was clamped and because of the patient's condition the operation was discontinued. The wound was closed with chromic sutures

Unfortunately, the patient expired five minutes after return from the operating room. No autopsy

was performed.

#### Summary

In conclusion, the case reported presents the following interesting observations:

1. The value of the roentgen therapeutic test in the differential diagnosis of mediastinal neoplasms is demonstrated.

Roentgen therapy properly and judiciously administered is of considerable value in the alleviation of symptoms and prolongation of life in comfort.

In the performance of surgical procedures in the therapy of malignant tumors it is of the utmost importance to use proper surgical judgment before decision upon radical or palliative measures.

4. The clinical course and marked regression of the neoplasm under roentgen therapy in this patient, though no biopsy was done, is strongly indicative of a malignant lymphosarcoma.

[Continued from page 712]

cavity, unassociated with the intestinal tract, so that it seems that the granulomatous lesion is rather widespread in the body and of a diverse protein character. In any case, in the gastrointestinal tract the characteristic part of the lesion consists in a spread of a surface lesion to an intramural position in the wall of the alimentary canal. Essentially the lesion seems to be a form of chronic infection of the lymphatic apparatus of the deeper layers of the bowel wall which implicates the solitary and aggregated collections of lymphadenoid follicles, the lymphatic channels, and the associated lymph nodes in the appropriate part of the mesentery. During the development of the lesion, the original agent of infection commonly disappears and secondary infection takes place. Intramural abscesses form. During the healing or attempted healing of the latter, cicatrization is accompanied by the excessive production of scar tissue, and the latter causes a hypertrophic thickening of the bowel wall with subsequent stenoses.

The nonspecific granulomatous lesion represents the end result of a diversely initiated lesion of bowel infection marked by intramural infection and subsequent evidences of an attempted overproductive

but unsuccessful healing.

These forms of lymphatic infection in the bowel either localize themselves to a restricted part of the bowel wall or they involve extensive segments. relative frequency with which this pathology affects the terminal ileum is due directly to the relative frequency with which this disease begins in the appendix, its most frequent localization. Both the localized and the diffuse forms exhibit the tendency to exacerbations of infection during which there is the same possibility of spreading of the lesion along further lymphatic channels.

It is my opinion that should the localized forms of the disease not become and remain symptomlessand such spontaneous remission periods of the disease are, in my experience, uncommon and do not necessarily correspond with any healing of the

lesion-medical or other forms of conservative treatment are not effective. Then one should remove the involved part of the alimentary canal with a radicality equal to and similar to that in use for a malignant lesion, so that one goes thoroughly beyond the diseased area in order to prevent any subsequent contiguous spread of the disease.

It is different with the forms in which a very extensive part of the intestine is involved. It is manifestly not very judicious to remove any extraordinary length of the small intestine, so that, perforce, we are compelled to treat these bad cases medically and conservatively. This is not the method of choice but of expediency. And these patients become chronic invalids and never attain any kind of cure which is at all comparable with that in the localized form.

The cases in which a number of areas in the same intestine are said to be "independent" localizations of this disease, undoubtedly result in its extensive forms in which healing takes place in certain rela-tively mildly involved areas, and in which other more severely diseased and damaged areas are not able to undergo healing. These cases lie in between the strictly localized and the extensive forms of the disease; and, perhaps, only in this type of case are short circuiting operations indicated again not as a method of choice, but as a method of expediency.

I do not agree that resection is rarely indicated. I believe that resection is commonly indicated and should always be done whenever it is technically possible to do so after a course of medical treatment has proved the ineffectiveness of the latter. Good permanent cures will be obtained when the resection is a sufficiently wide one. In the other cases, the treatment, whether short-circuiting or conservative medical, is just the best one can do at the present writing in the face of conditions beyond our effective surgical reach.

> Very truly yours, A. O. WILENSKY, M.D.

# Annual Reports

# Medical Society of the State of New York 1942-1943

# Report of the President

To the House of Delegates; Gentlemen:

It is with feelings of appreciation and thankfulness that this report is presented. From the Presidency, the work of the members of the State Society can be viewed only with deep regard. The work of our men in the armed forces, who have relinquished all their professional home ties and interests, who, at the call of their country, have left their families and their homes to protect the health and heal the wounds of our soldiers and sailors, continues to receive special praise from their Commanding Officer. They have brought to us all increased pride in them, and to our profession, honor. More than 10,000 of our doctors from New York State are in the Navy and Army forces Although the need is less pressing this year for the services under the Selective Service Act and in Civilian Defense, our doctors at home continue to meet the demands made on them and to remain trained and ready at all times for the emergencies of civilian life. Governor Dewey, in his address to the Legislature, mentioned with commendation the cooperation of the State and the medical profession in war partici-pation and preinduction work, as well as in all the health programs.

The duties of caring for the health of the people, with the reduced number of doctors, with full demand on hospitals with much depleted staffs, have been onerous burdens well and faithfully discharged. While some services in hospitals necessarily have been curtailed, none essential in the care of the

sick has been neglected.

It is particularly pleasing to recognize in such troublesome and burdensome times the work and sacrifice of so many doctors for the objects of this State Society The science of medicine has been advanced, as the programs and attendance at the meetings of our county societies and district branches attest.

Despite special difficulties, the postgraduate work arranged by the Council Committee on Public Health and Education has been appropriate to the times and to our present degree of knowledge of medical science. This postgraduate work with its staff of distinguished teachers, in the variety and usefulness of the subjects presented and its availability to the convenience of attending doctors, is an achievement of real merit and benefit; it must be continued. The rapid diffusion of knowledge acquired from the war and the new technics gained by many men make these postgraduate courses imperative.

The Public Health and Education Committee through its subcommittees conducts many activities well, as the accompanying separate reports show. Some of these deserve special attention because of the importance of the objects, and the amount of time and labor so freely given: maternal and child welfare (including the Federal Emergency Maternity and Infant Care Program in New York State), development of a school health teaching program, tuberculosis and chest diseases, dental health, problems of the hard of hearing and the deaf, industrial health, and blood and plasma exchange

The Chairman of the Council Committee on Public Health and Education, through the Subcommittees on Maternal Welfare and Child Welfare and assisted by your officers, devoted long hours to the E.M.I.C. (Federal Emergency Maternity and Infant Care) Program. Real cooperation and assistance were received from the New York State Commissioner of Health and from the New York City Commissioner of Health. The orders came from Washington, to be administered by the State Health Department. All plans for administration have to be accepted by the Children's Bureau of the United States Department of Labor in Washington before any funds will be allotted to the states. With the object of the Act, to provide maternity and infant care for the wives and babies of members of our armed forces in the four lower grades, let me express our complete accord. With such details as the interposition of a third party—the government—between the patient and her physician, the fixing of fees by Washington for all the states, fees for confinement and for infant care, the regulation of the number of visits and amount of treatment permitted for infants, the danger of the temporary Emergency Act becoming a permanent fixture, we are in complete disagreement.

Much attention has been given to the Commission appointed under the Moreland Act to investigate the administration of the Workmen's Compensation Act. The administration of this law, in its medical provisions, has, under ruling of the Industrial Commissioner, been conducted by the special committees of the county societies. The State Committee and its Director of the Workmen's Compensation Bureau have acted in a supervisory and advisory position. The quality of medical service to the injured has been good—vastly improved over treatment prevailing before the past eight years.

There have been some abuses revealed by the Commission, which have arisen because lawful

authority to remedy them has been withheld until the past few months. The county societies have had responsibility without authority. It may be unnecessary to add that every dereliction of duty on the part of any doctor will be tried by his County Committee and, if warranted, proper punishment will be recommended to the Industrial Commission. Several hundreds of these cases have up to this time received this action. The Moreland Commission has finished its work, and we are daily awaiting its report at this date (March 1) to the Governor of the State.

The Committee on Medical Licensure has completed its work to date and presented a splendid, informative, constructive report, with recommendations, all of which were approved by the Council. Although many conferences with representatives and members of the Board of Regents of the University of the State were held, much that was desired was not attained. Despite the friendliness to our purpose of the Board of Regents, some of the laws of the State and rulings of the Supreme Court are in opposi-

tion to suggested changes.

The details dictated by a central bureau in Washington on the E.M.I.C. Program to all the participating states afford an example of the control that would be exercir. d by a central Washington bureau (in National Compulsory Sickness Acts—such as the Wagner bill) on all parts of the practice of medicine. There would be third party interference and intrusion between doctor and patient, there would be standardization, supervision, and control of all hospitals and all medical education; and in that control below the Administrator but including the Advisory Board there is no mandatory place of any authority for a physician. The lay clerks in the local Social Security office of an area would be in charge. The Wagner-Murray-Dingell bill has been presented for discussion before nearly all of our county societies, and the medical provisions have been condemned by our Council by unanimous vote.

For these and other reasons, we are more and more driven, through the introduction of such bills, to realize the possibilities and advantages of the prepayment plans of this State. To the oft-repeated question of the proponents of government compulsory insurance as to what other choice exists, here is one answer. Although there are in thirteen states over a million members of prepayment plans, the number is not large enough. Lack of knowledge of the beneficial possibilities seems to be the retarding influence. The Subcommittee on Medical Expense Insurance, through its Chairman, President-Elect Bauckus, has worked faithfully all the year. Its activities have been presented to and considered by the Council at all its sessions, and it is an earnest hope that all our members will take deep interest.

Acknowledgment with commendation should be made for the work of those responsible for the production of the Journal. Dr. Laurance D. Redway as Literary Editor, Dr. Peter Irving as Managing Editor, and Mr. Dwight Anderson as Business Manager of the Journal. This work has been greatly aided by the Publication Committee. Also, the general office and the business office of the Journal have been able with the advice of the Committee on Office Administration and Policies to fit their different duties together most smoothly.

I could dwell deservedly at great length on the work of all the Committees, and on the work of your Council. To all these members who have come to meetings from all parts of the State, who have sacrificed time and work and comfort to bring their knowledge and experience to the success of the Society in accomplishing their purposes of increasing medical science and making it more widely available to the sick; to them I give an expression of my appreciation, my gratitude, and my confident reliance.

THOMAS A. McGoldrick, M.D., President
March 1, 1944

# Report of the Secretary

To the House of Delegates; Gentlemen:

Since your last meeting on May 3 and 4, 1943, the administrative year has seen a full call for accomplishment of regular activities with special stress on certain factors. The headquarters office has been able to meet all demands, general and special Coordination of all activities has been effected.

Membership.—Elected in 1943 were 710 new members; 177 were reinstated. The net increase for the year, as shown below, was 339.

193916,785	

New York Office.—The office work of the Society has been carried on this year without increase of the general staff and with a number of changes of personnel. One worker joined the "W.A.S.P.S.," and one (from the Bureau of Public Relations) joined the U.S. Marine Corps, Women's Reserve.

The Joyneya staff between her beginning the corps.

The Journal staff, however, has been increased by three employees owing to the necessity to take into the office the task of securing advertising for the Journal. This work had previously been done by

contract with an outside agency run by Mr. Kent Lighty. Mr. Lighty had died early in 1943, and, finally, on May 1, 1943, arrangements were com-pleted to employ two salesmen and a secretary as part of the Journal staff working under Mr. Anderson as Business Manager of the Journal. Experience with this change has proved most satis-

The nonpublication of the Directory has made it unnecessary to employ transient workers for com-

pilation.

The usual increase of work in securing professional data about physicians registered in New York State has been met. In addition, there has been the task of keeping up—as well as possible—the file of New York doctors in service (from which the Honor Roll of members published in the JOURNAL is prepared).

Work of the War Participation Committee has continued in varying degree, mainly in assisting the Army to get physicians in the twelve different groups for work on the Pre-Induction Boards. The major work in this field has, of course, fallen on the county societies in the seven different areas of the

State, but has flowed through this office. It has been very helpful to have in operation

during the year the Special Committee on Office Administration and Policies, particularly under present wartime conditions.

Coordination of Activities.—The past administrative year has been one of continuing active work by Council, Council Committees, and Subcom-

Several new committees were added following your last meeting:

A Subcommittee on Blood and Plasma Exchange Banks has worked under the Council Committee on Public Health and Education, with Dr. George M. Mackenzie, of Cooperstown, as Chairman.

Two subcommittees were appointed to work with the Council Committee on Legislation: Subcommittee on Chiropractic, Dr. Ralph T. Todd, of Tarrytown, Chairman; Subcommittee on Basic Science Law, Dr. Leo F. Simpson, of

Rochester, Chairman.

Following the creation of the new A.M.A. Council on Medical Service and Public Relations. of which Dr. Louis H. Bauer is Chairman, there was created a Council Committee on Medical Service and Public Relations, to cooperate with the new Council, with the following membership: Dr. John L. Bauer, Brooklyn, Chairman; Dr. Walter W. Mott, White Plains; Dr. Leo F. Walter W. Mott, White Plains; Dr. Leo F. Simpson, Rochester; Dr. Herbert H. Bauckus, Buffalo; Dr. Joseph S. Lawrence, Albany, ex Buffalo; Dr. Joseph S. Lawrence, Albany, ex officio; Dr. Peter Irving, New York, ex officio. Under date of December 4, 1943, a memorandum was sent to all county societies, urging them likewise to appoint committees to cooperate. through the State Society Committee, with this A.M.A. Council.

Finally, the new Special Committee of the Medical Society of the State of New York has been hard at work through the year, the 'Planning Committee for Medical Policies," with the following membership: Dr. Louis H. Bauer, Hemp-stead, Chairman; Drs. Thomas A. McGoldrick

Brooklyn; Herbert H. Bauckus, Buffalo; Peter Brooklyn; Herbert H. Daucaus, Juniffe, Bronx; Irving, New York; Edward R. Cunniffe, Bronx; Walter W. George W. Cottis, Jamestown; Walter W. Mott, White Plains; J. Stanley Kenney, New York; Leo F. Simpson, Rochester; Herman G. Weiskotten, Syracuse; Norman S. Moore, Ithaca.

The emphasis during the year has lain on problems in public health from various angles. Postgraduate education has been steadily stepped up. Many conferences with the State Department of Health have brought useful aid from that Department. Development of the Child Health Program has been pushed in conjunction with the Department of Education. The truly remarkable values of newer-day use of blood and plasma and the establishment of exchange banks have been well worth the work of a new subcommittee. The Emergency Maternity and Infant Care Program has demanded continued discussions in the effort to help in the best ways to provide care for wives and children of men in service. Promotion of nonprofit medical expense insurance has received much committee attention and conferences have been held with others concerned.

The experience of having a fall meeting of the County Legislative Chairmen on the same day as the County Secretaries was, in the opinion of your Secretary, well worth while. He recommends that

this become a regular custom.

Your Secretary felt honored to receive a request from Governor Dewey to serve on a Commission to Investigate the Department of Mental Hygiene. . This, with the approval of the Council, was accepted. This Commission asked and received from President McGoldrick nominations for an Advisory Committee of physicians to confer with it in the course of its study of existing conditions and in working out constructive recommendations for improvement. The report will have been issued before your meet-

It has been a year of important work in which your Secretary has felt it a privilege to help all concerned to realize the objectives of the organization, "... to extend medical knowledge and advance medical science; to elevate the standard of medical education; to secure the enactment and enforcement of just medical and public health laws; to promote friendly intercourse among physicians; to safeguard the professional and economic integrity of its members and to establish and maintain them in appropriate and equitable relationship with the public, with government, and with all agencies working in the fields of health and welfare; and to enlighten and direct public opinion in regard to the problems of medicine and health for the best interests of the people of the State." [Excerpt from Article 1, Constitution of the Medical Society of New York.]

It is with deep sorrow that your Secretary reports the death on February 18, 1944, of Miss Lily D. Baldwin, office manager emeritus, who had worked thirty-seven years for the Society before her retirement in 1927.

ment in 1937. In closing, I wish to record my gratitude to the office force for their loyal and devoted work under the excellent supervision of Miss Dougherty.

Respectfully submitted, PETER IRVING, M.D., Secretary

March 15, 1944

# Report of the Treasurer

To the House of Delegates; Gentlemen:

The financial status of the Society is shown on the following pages by excerpts from the annual report of the auditors, Messrs. J. K. Lasser & Co., for the

year 1943.

During the year there has been an increase in our surplus balance of \$43,477, of which \$27,882 represents appreciation in the market value of our securities. Remission of dues for members in the armed forces amounted to \$43,420, but there has been some gain in membership partially to offset this. increase in surplus is quite remarkable, and it is in spite of the payment of \$13,200 to the Lighty estate. It is due also to a net income of \$6,419 from securities (interest and dividends of \$12,026 less loss on sales of securities amounting to \$5,607) and to an excess of operating income over expenses of \$22,400. This last credit of net operating income is in the main the result of three factors: the Journal, which turned back to the Society about \$6,000 net, instead of being a debit item as in former years; the fact that the Directory could not be published; and careful management of the financial affairs of the Society. Among the operating expenses only one item has materially increased—namely, traveling expenses. And here the increase was in the Annual Conference of Legislative Chairmen (two conferences in 1943), the A.M.A. Delegates (Chicago), the Planning Committee for Medical Policies, and the Emergency Maternal and Infant Care. These last two are new

There are two points of special interest in the auditor's report. This year there is an item in the Journal operations for membership dues allocated to circulation income. This sum of \$17,603 is more than a mere bookkeeping entry, even though it is balanced and more than balanced by the net income from the Journal, of \$23,598.58, on the operating sheet. It is an actual allocation of one dollar from the State assessment of each paying member for his subscription to the Journal. This must be done in order to comply with the postal regulations

governing second class mail matter.

The other point of special interest is one that has already been mentioned. In the audit it is called 'Payment to terminate Kent Lighty agreement," but that term does not tell the whole story. agreement, or, rather, contract, with Mr. Lighty was terminated automatically on his death early in 1943; the payment referred to was in settlement of claims on the Society by his estate for advertising commissions still to come due. Mr. Lighty was an agent. He received a commission on the advertising he obtained, payable to him when the advertisers had paid us. We billed the advertiser shortly after his advertisement was published. If his advertisement appeared in the JOURNAL each month he was billed each month, and Mr. Lighty received his commission when this bill was paid. On his death there were contracts, which he had obtained, for publication in the future, running perhaps for one or two years. It was the commissions on this advertising, contracted for but still to be printed, which were the basis of the claim of the Lighty estate. A settlement of this claim was advised by our counsel; an agreement as to the amount was reached by our counsel and the counsel for the estate, and the surrogate gave his approval (this was necessary, as there was an infant child involved). The payment of this amount was voted by the Publication Committee and was approved by a vote of the Board of Trustees. The Trustees also ordered that this sum be charged to the General Funds of the Society and not to the Journal account.

The present advertising setup is quite different. In the spring of 1943, after the death of Mr. Lighty, it was decided by the Council and the Board of Trustees, after study and recommendation by the Publication Committee, not to employ an agency again but to take charge of the work in our own office. So, beginning in May, 1943, two advertising salesmen were employed. They were given salaries, payable monthly; and they were each given a quota of advertising space which they are expected to fill. These quotas are not based on contracts for future publishing, but on the actual amount printed in the JOURNAL that month. If the amount printed is above the quota, they are given a certain percentage as a bonus; if the amount is below the quota, they are penalized by the same percentage. Thus the incentive type of salary is retained, but we are on a pay-as-you-go basis. If one or both of the salesmen should leave us for any reason, there will be no future payments due them, no commissions on future publishings. This is felt by us to be a much more satisfactory arrangement.

In closing I wish to thank the members of the office staff who have the care of the financial details of the Society for their devotion to their duties and for the cheerfulness with which they have helped the Treasurer in his work.

Respectfully submitted, Kirby Dwight, M.D., Treasurer

March 7, 1944

#### Auditors' Statement

We have completed an examination of the balance sheet of the Medical Society of the State of New York as of December 31, 1943, and the statements of income and capital for the year ended with that date, and have reviewed the system of internal control and the accounting procedures of the Society and without making a detailed audit of transactions have examined or tested accounting records of the Society and other supporting evidence by methods and to the extent we deemed appropriate.

In our opinion, the accompanying balance sheet and related statements of income and capital present fairly the position of the Society at December 31, 1943, and the results of its operations for the year

ended that date.

Respectfully submitted, J. K. Lasser & Co., Accountants & Auditors

# Report of the Board of Trustees

To the House of Delegates; Gentlemen:

Future social problems, international money values, the possibility of advancing inflation, the present war expenditures, and all the complexities of taxation that may affect the national income have given the Trustees concern this year in the management of the investments of the Society.

ment of the investments of the Society.

Consideration has been given at every meeting of the Board to the financial information and advice received from The Chase National Bank. The decisions of the Trustees appear in the Report of the Treasurer and in the report of the auditors. It

would serve no useful purpose to repeat them.

The Trustees call attention to the fact that the publication of the JOURNAL is now a financial asset. Details of this are in the treasurer's report, the auditors' report, and in the report of the Publication

Committee. There is an appreciation in the value of the investment fund as a whole though some items are still below the original cost. The financial state of the Society is sound, owing to appreciation in the value of the investment fund; the financial asset of the Journal this year (for the first time); the income from investments, \$12,000; omission of publishing a Directory, saving thereby \$22,000 (the net cost); and conservative administration of the income of the Society. The income of the Society is reduced by \$43,000 because of remission of dues of members in the armed forces. Six hundred new members have made up some of this loss, so that the actual loss this year is only \$37,000. The financial soundness of the Society is largely due to

the careful management of the financial affairs of the Society by the treasurer. It has been accomplished without curtailing essential activities.

The only recommendation of the Trustees this year is that thought should be given to placing the Society's investments in the hands of a trust company. This would relieve the Trustees from functioning in a field for which they are not well trained. There are trust companies of one hundred or more years of experience, with records of safety of principal while producing desirable income. Decisions would be easier for the Trustees and their responsibility less. The Board recommends that a study of this be made during the coming year. There are excellent studies of economics going on in many places. The Society should look upon the income of its investments for use and its investment fund to keep as a producing source of income to use as needed.

A supplementary report of the Board of Trustees will appear in the next issue of the JOURNAL.

Respectfully submitted,
THOMAS M. BRENNAN, M.D.

# Report of the Council

To the House of Delegates; Gentlemen:

Your Council has the honor to report on its executive and administrative management of the affairs of the Society in the period following your last meeting on May 3-6, 1943. The various matters that came before it, actions thereon, and recommendations are here presented in successive "Parts" of this report.

#### PART I

#### Postgraduate Education

#### REPORT

The Council Committee on Public Health and Education arranges postgraduate instruction on a wide variety of subjects for meetings of county medical societies, hospital staffs, and other medical groups. This program is made available through the combined efforts of the members of the Medical Society of the State of New York, the faculties of medical schools and research institutions, the New York State Department of Health, the Dental Society of the State of New York, the Division of Industrial Hygiene of the New York State Department of Labor, and several other organizations and associations.

A considerable part of these activities is presented in cooperation with the New York State Department of Health. In addition to the courses arranged as series of lectures, speakers on many subjects may be provided for single lectures. The Committee also arranges for a one-day session designated as a "Teaching Day." A Teaching Day is a combination of clinics, demonstrations, and lectures for an afternoon and evening.

The Committee prepares and distributes the Course Outline Book, which lists subjects and speakers available. This year, to provide a wider distribution, the book was printed, which is much better than the bulky mimeographed form. The Course Outline Book is revised annually.

Most of the instructors are connected with the medical schools. In May, 1943, letters were sent to all physicians who had arranged courses in the past requesting them to make any changes in sub-

jects or speakers they desired.

On August 19, 1943, in New York City, the Chairman of the Council Committee on Public Health and Education held a meeting of the Committee with officers of the Medical Society of the State of New York, the chairmen of the Subcommittees on Maternal Welfare, Child Welfare, 4-H Clubs and Youth Health Activities, Tuberculosis and Diseases of the Chest, Industrial Health, Blood and Plasma Exchange Banks, Hard of Hearing and the Deaf, the State Commissioner of Health, the Assistant Commissioner for Medical Administration of the Commissioner of the New York City Department of Health. This meeting was held to review the activities of the Committee in the field of postgraduate education and to discuss plans for the coming year.

Special consideration was given to Maternal and Child Welfare, with reference to the Federal Emergency Maternity and Infant Care Program. The State Commissioner of Health discussed the plan as it operates in New York State. The rheumatic fever program received much attention, as did health instruction in the public schools.

The Chairman of the Subcommittee on 4-H Clubs and Youth Health Activities, as a member of the Home and Farm Safety Advisory Committee of the Division of Public Health Education, New York State Department of Health, discussed this program from the physician's angle and remarked that physicians could contribute to this program in many ways. It was suggested at this meeting that the chairman of the Subcommittee on 4-H Clubs and Youth Health Activities prepare an article on the Home and Farm Safety program and submit it for publication in the New York State Journal of Medicine.

Following this meeting the material for the Course Outline Book was prepared and submitted to the printer. Copies of the Course Outline Book were distributed to officers of the Medical Society of the State of New York, members of the Council Committee on Public Health and Education and the Subcommittees, Regional Chairmen in Obstetrics and Pediatrics, State Commissioner of Health, Assistant Commissioners and Directors of Divisions of the New York State Department of Health, District State Health Officers, City and County Health Commissioners, physicians who arranged courses in the Course Outline Book, presidents, secretaries, and chairmen of Public Health and Program Committees of county medical societies, deans of medical schools in the United States, librarians of the medical schools in the State of New York, secretaries of state medical societies in the United States, Commissioners of Health in the various states, members of the New York State Board of Regents, New York State Commissioner of Education and Directors of several divisions of the New York State Education Department, officers of the American Medical Association and members of the Council on Medical Education and Hospitals of the American Medical Association, Secretary and Executive Secretary of the State Charities Aid Association, State Com-missioner of Mental Hygiene, and Commissioner of the New York State Department of Social Welfare.

The book contains fifty-seven announcements, including outlines of courses, teaching days, and

single lectures on special subjects.

In addition to the instruction offered in the Course Outline Book last year, the Committee arranged for instruction in gynecology, meningococcus meningitis, penicillin, poliomyelitis, and tropical medicine.

Arrangements are being made to increase the

instruction in penicillin therapy.

A list of physicians who will discuss subjects pertaining to home and farm accidents will soon be available.

Arrangements for postgraduate instruction, either as courses consisting of a series of lectures or as single lectures, were made for eighteen county medical societies. The following is a list of the counties which have had or will have had these meetings this year:

Regional Meetings and Teaching Days.—For these meetings, invitations were sent to the memberships of the medical societies in counties adjacent to that in which the instruction was given, or to the membership in certain regions and districts where the meetings were held. The Committee arranged for speakers, and for printing and distribution of programs to county medical societies, medical schools, hospitals, the New York State Journal of Medical Association, and other publications. The Medical Society of the State of New York pays traveling expenses of the speakers, and the honoraria for all speakers are paid by the Medical Society of the State of New York State Department of Health. The following is a list of counties where Regional Meetings or Teaching Days have been held or will be held this year:

. ~	Instruction *Cancer	No. Lecture: 2

Public health matters receiving particular emphasis from the New York State Department of Health and the Medical Society of the State of New York this year have been cancer, communicable diseases, gynecology, industrial medicine, meningococcus meningitis, nutrition, obstetrics, orthopaedics, pediatrics, penicillin therapy, plasma therapy, poliomyelitis, rheumatic fever-rheumatic heart disease, syphilis, tropical medicine, tuberculosis, and war medicine and surgery. The part of the Committee in these activities has been, to a large extent, in the field of postgraduate instruction. Instruction in many of these subjects has been given and a share of the cost was borne by the New York State Department of Health. The counties and the subjects were the following:

		Ņo

The Committee arranged for postgraduate instruction to be presented in twenty-three counties with a total of ninety-one lectures—sixty-four of which were given jointly by the New York State Department of Health and the Medical Society of the State of New York.

<sup>\*</sup> Traveling expenses and honoraria of speakers and printing of programs provided by the New York State Department of Health.

#### PART II

#### Maternal and Child Welfare

Maternal Welfare.—In March, 1943,1 Congress made funds available for the states to provide socalled "Emergency Maternity and Infant Care," obstetric and pediatric care (for infants under one year) to wives and infants of men in the armed forces, Army, Navy, Marine Corps, and Coast Guard, of certain grades.

Shortly thereafter (March 24-25), the Children's Bureau of the United States Department of Labor, which directs the program, conferred in Washington with the state and territorial health officers and their directors of maternal and child health programs for the purpose of presenting the Children's Bureau's plans to these officials and discussing the Bureau's administrative regulations governing the use of the Federal appropriations for this purpose.

Immediately after returning from Washington, Dr. Edward S. Godfrey, Jr., New York State Commissioner of Health, requested a conference with the Subcommittee on Maternal Welfare, the Subcommittee on Child Welfare, and the Council Com-

mittee on Public Health and Education.

The first meeting for the discussion of the plan was held in New York City on April 7, 1943. Subsequent meetings were held in New York City on the following dates: June 2, 17; August 19, 25; October 12, 28; December 8, 15, 1943; and January 10, 1944. These conferences were attended by the President, President-elect, members of the Council Committee on Public Health and Education and the Subcommittees on Maternal Welfare and Child Welfare, and sometimes other officers of the Medical Society of the State of New York, the State Commissioner of Health and members of his staff, and the Commissioner of Health of the City of New York Department of Health and members of his

The Regional Chairmen in Obstetrics and the Regional Chairmen in Pediatrics attended the meeting held on October 28, 1943. Copies of the "Proceedings" at this meeting were supplied to

every member of the Council.

The features of the E.M.I.C. Program, as pre-ented by the Children's Bureau, which have received particular attention by the members of the conferences are the following:

1. The requirement that payments be made directly to the physician or hospital rendering service. It was the view of the Council Committees\* that this money should be given as a cash allotment directly

to the serviceman's wife.

2. The provision of hospital care at the "ward cost per patient day" to be determined by a prearranged formula. It was the opinion of the Council Committees that the use of ward facilities would tend to direct patients away from private care, inasmuch as many hospitals, especially in the metropolitan New York area, would not permit private patients on their open wards.

3. Provision for remuneration of physicians. It was the opinion of the Council Committees that the compensation provided for maternal care was

New York State J. Med. 43: 1133 (June 15) 1943.

The term "Council Committees" as herein and subsequently used in this Report shall mean the Council Com-

mittee on Public Health and Education and its Subcommittees on Maternal Welfare and Child Welfare.

low in comparison to that usually received by physi-

cians in New York State for such services.

4. The plan provides for additional fees where the services of a qualified consultant are required, but makes no provision for recognizing the extra services of a qualified obstetrician or pediatrician where such physician has undertaken the basic maternity or sick infant care of a patient under the plan. In other words, if an obstetrician accepts a maternity case he must provide all care related to the pregnancy, including the care of major obstetric complications for the fixed fee, whereas, if the basic maternity care is given by a general practitioner at the same fee, he is not expected to care for major complications and may call upon a qualified specialist, to whom a separate fee is paid.

The Council Committees believe that some system should be devised for recognition of the extra services of the qualified specialist and for compensating him in keeping with the extra services ren-

dered

Fees paid under the plan must be the only compensation received for the services authorized under the This regulation provides that the payments to the hospitals or physicians by the State Department of Health cannot be used as a means of part payment for more luxurious hospital accommodations other than those offered under the plan nor can the patient pay the physician a supplementary fee regardless of her possible ability to do so.

The Council Committees believe that in view of the failure to have the available funds paid directly as a cash allotment, an alternative would be to allow the funds available to be paid directly to the physician or hospital as complete or partial payment for the services rendered, in accordance with the patient's own arrangements with the physician and

Initial plan that care given preceding date of authorization of the formal application for care could not be paid for under the plan. The Council Committees and the State Commissioner of Health objected strenuously to these limitations on the ground that they set the necessary administrative procedures above the actual intent of the appropriation, and the initial plan for New York State submitted to the Children's Bureau made broad provisions for retroactive approvals to provide care for those eligible from April 1, 1943.

The New York State Plan<sup>2</sup> was finally put into effect on July 1, 1943.

The Children's Bureau has made changes in the plan as a result of recommendations proposed at conferences of the Council Committees and representatives of the New York State Department of Health. (See"A Report of the Council Committees on the Federal Emergency Maternity and Infant Care Program in New York State," New York State Journal of Medicine, February 1, 1944, Vol. 44, No. 3, p. 295.) Efforts to obtain further desirable changes have by no means ceased. Although the members of the conformation (See"A Report of the Council Committees though the members of the conferences were dissatisfied with several aspects of the program, there never were any objections to its objective, namely, to assure good maternity and infant care for the families of men in the armed forces. This opinion was officially expressed by the House of Delegates of the American Medical Association<sup>3</sup> and has been

<sup>2</sup> A summary statement of this plan appeared in the February I issue of the New York State Journal of Medicine. Vol. 44. No. 3, p. 298.

J.A.M.A. 122, 621 (June 26) 1943.

repeatedly expressed by the officers of the Medical Society of the State of New York and in resolutions of many of its constituent county medical societies.

At the later conferences many details of the plan and several major issues which had not been previously presented to the Children's Bureau have been discussed and further adjustments in the plan are anticipated.

The following are examples of matters now pend-

The initial plan of the Children's Bureau urges the importance of infant health supervision but in so doing provides that it must be rendered through approved child health conferences or well-baby clinics where they exist and are available without a so-called "means test." Where such are not available such supervision can be given under the plan only by a pediatrician or physician meeting special qualifications in this field.

While the Council Committees and the State Commissioner of Health were thoroughly in accord with the inclusion of provisions for health supervision, they felt that the regulations were impractical and unreasonable in that they did not permit the patient the choice of a child-health conference or a private physician, nor did they make a reasonable provision for the general practitioner who may de-liver the baby and take care of it while it is sick but not supervise it while it is well.

These objections were presented by the State Commissioner of Health and other persons and groups, and early revision of the present policies is anticipated so that health supervision may be established on a more reasonable and workable

2. The Children's Bureau has interpreted the appropriation as intended to cover all medical care required by the expectant mother throughout her preg-nancy and for six weeks thereafter. In this inter-pretation it has stated that the fee for complete maternity care or the fees for such additional consultant services as may be indicated shall cover all necessary medical care during said period.

The Council Committees and the State Commissioner of Health believe that this policy is un-reasonable and will be changed in favor of fairer definition of the types and extent of illnesses which the physician is called upon to care for under the fee

for complete maternity care.

3. Criticism by the practicing physicians of the various forms and statements which the State Department of Health has required in the operation of this plan. At the request of the State Commissioner of Health, the President of the Medical Society of the State of New York, with the approval of the Council, appointed the following physicians as a committee to advise with the State Commissioner of Health on the revision and simplification of these preliminary forms:

George W. Kosmak, M.D. New York James K. Quigley, M.D. Rochester Herbert E. Wells, M.D. Buffalo

The State Commissioner of Health has told the Council Committees that the revision is completed and that simplified forms have resulted which should reduce to a minimum the complexity of this particular phase of the program.

There has been splendid cooperation between the official State agencies and the Medical Society of the State of New York in the development of the plan for the State of New York.

The Subcommittee on Maternal Welfare has the following members: Charles A. Gordon, M.D., Chairman, Brooklyn; Edward C. Hughes, M.D., Syracuse; Alexander T. Martin, M.D., New York; James K. Quigley, M.D., Rochester.

#### PART III

# School Health Program

In the "Regulations of the Commissioner of Education Governing Health and Physical Education," published in July, 1943, the following paragraph appears on page 4:

"Health Teaching in the Secondary Schools. The secondary school curriculum shall include health teaching as a constant for all pupils. In addition to continued health guidance in the junior high school grades, provision shall also be made for approved health teaching, either as a part of a broad science program or as a separate course. In addition to continued health guidance in the senior high school, provision shall also be made for an approved course or courses in health teaching carrying one unit of credit. Health teaching shall be required for all pupils in the junior and senior high school grades and shall be taught by teachers with approved preparation. A member of each faculty with approved preparation shall be designated as health coordinator, in order that the entire faculty may cooperate in realizing the potential health-teaching values of the schoolprogram."

To assist in the preparation of a "syllabus" for health teaching in the high schools, the Subcommittee and the syllabus of the mittee on Child Welfare and the three physicians designated by the Council to act in an advisory capacity to the State Education Department have attended several conferences with representatives of the State Education Department. These meetings were held on June 24; July 2, 30; September 3, 8, 27; October 12; December 8, 1943; January 10; and February 2, 6, 1944. Also present at these conferences were represented by the State Department of the State Sta ferences were representatives from the State Department of Health and the New York State Association

of School Physicians.

The syllabus in tentative form will soon be submitted to the New York State Education Depart-

Examination of teachers and other school personnel, as a part of the tuberculosis control program, is receiving the attention of the State Education Department. Members of the State Education Department have been appointed by the Commissioner of Education, Dr. George D. Stoddard, to study similar programs in the various states. representative of the State Education Department has been designated by Commissioner Stoddard to represent the Department on the State Tuberculosis Conference Committee.

In reply to a letter from Dr. George M. Wheatley, Assistant Medical Director, Metropolitan Life Insurance Company, under date of November 5, 1943, addressed to the Chairman of the Council Committee on Public Health and Education, regarding the activities of the Medical Society of the State of New York in school health, the following statement was submitted on December 3, 1943:

"The Medical Society of the State of New York has been interested in the School Health program for several years. The Council Committee on Public Health and Education and several subcommittees have concerned themselves with many programs, including the following: (a) school health service organization at the state level; (b) standardization of the physical examination for school children and other youth groups; (c) health education in the elementary and secondary schools including a required formal course with credit in high school; (d) the course content for health instruction in the high school; (e) qualifications for school physicians serving less than half time; (f) undergraduate instruction of medical students in school health; (g) postgraduate instruction in school health; (h) school health committees for county medical societies (forty-four of the sixtyone county medical societies now have committees on School Health); (i) rheumatic fever-rheumatic heart disease as a part of the school health program; (j) health examinations, including xrays, for teachers and other personnel as a part of the tuberculosis control program have been receiving attention during the present year, especially by the Subcommittee on Tuberculosis and Diseases of the Chest.

"There has been very satisfactory cooperation between the State Departments of Education and Health, the New York State Association of School Physicians, the Dental Society of the State of New York, and several other organizations concerned with the School Health program and the Medical Society of the State of New York. Conferences are held quite frequently."

To date, forty-five of the sixty-one county medical societies have appointed committees or designated representatives in school health.

The membership of the Advisory Committee of the Medical Society of the State of New York to the State Education Department is as follows:

Paul W. Beaven, M.D., Vice-Chairman, Sub-Committee on Child Welfare, 26 South Goodman Street, Rochester

J. G. Fred Hiss, M.D., Chairman, Subcommittee on 4-H Clubs and Youth Health Activities, 505 State Tower Building, Syracuse

A. C. Silverman, M.D., member, Subcommittee on Child Welfare, 608 East Genesee Street, Syracuse

#### PART IV

#### Public Health Activities

4-H Clubs and Youth Health Activities .- The Chairman of this Subcommittee, Dr. J. G. Fred Hiss, Syracuse, attended a meeting in Syracuse on November 10, 1943, of the Health Committee of the 4-H Club. The health program of the 4-H Club was discussed. It was felt that the program was very satisfactory in those counties in which it was being followed, but, unfortunately, too few counties were interested in reporting their results. A report was distributed at this meeting and everyone felt that there were many others examined, especially as it is possible to use the school examinations in counting the health program or determing the per-centage, but that many counties were probably so busy with other phases of war work that they neg-lected the tabulation of data. Methods were discussed for making these other counties more healthconscious so that they would develop a desire to push the health activities and to report their results.

The Council has indorsed the Home and Farm Safety Program of the State Department of Health. This special program is conducted under the leadership of the Division of Public Health Education with the help of an Advisory Committee on Home and Farm Safety. Dr. J. G. Fred Hiss, already closely connected with the Division through work with 4-H Clubs and other youth groups, is chairman of the Physician's Committee on Personal Health and Safety. The Chairman of the Council Committee on Public Health and Education is also a member of this Committee. Drs. Hiss and Mitchell have attended several meetings of this Committee. At a meeting arranged by the State Home and Farm Safety Committee held in Albany on January

18, 1944, Dr. O. W. H. Mitchell was one of the

speakers.

As a part of the Home and Farm Safety program, a group of physicians will soon be designated to discuss appropriate subjects at meetings of county medical societies. A list of subjects and speakers will appear in the next issue of the Course Outline Book.

Tuberculosis and Chest Diseases.—At the time of the Annual Meeting of the Medical Society of the State of New York last year, the Subcommittee on Tuberculosis and Diseases of the Chest held a luncheon meeting on May 5, 1943, at Hotel Statler, Buffalo. Present at this meeting were representatives of county medical societies and other groups interested in the tuberculosis control program. About one hundred physicians attended this session. This meeting was held to acquaint the county society representatives with the objectives of the program and many physicians were chosen to present different problems. It was a successful meeting and very much worth while.

As reported last year, with the approval of the Council, the Subcommittee communicated with the secretaries of the county

them to appoint commit.

to represent the societies in the field of tuberculosis To date, fifty-two of the sixty-one county control. medical societies have done so.

The education program available appears in the

Course Outline Book.

The Subcommittee arranged for a Teaching Day on Tuberculosis and Diseases of the Chest, which was held in Syracuse on July 9, 1943. The meeting was well attended and comments received were favorable.

Preceding this meeting the Subcommittee held a

meeting in Syracuse.

On October 13, 1943, a meeting of the Subcommittee was held in New York City to consider the development of the teaching day programs to be presented in the western and southern parts of the State. Also at this meeting arrangements were discussed regarding the Annual Meeting of the Medical Society of the State of New York. In addition to the members of the Subcommittee, representatives from the New York State Department of Health were also present at the meeting.

The Subcommittee is collaborating with the officers of the Section on Medicine to have the subject of tuberculosis presented at the 1944 Annual Meeting of the Medical Society of the State of New York, to be held in New York City. Arrangements have been completed for an exhibit at the time of the

Annual Meeting.

As a part of the Tuberculosis Control program, the Chairman of the Subcommittee on Tuberculosis and Diseases of the Chest has conferred with representatives of the State Education Department regarding the examination of teachers and other school personnel.

The Chairman of the Subcommittee on Tuberculosis and Diseases of the Chest is a member of the

State Tuberculosis Conference Committee. The membership of the Subcommittee on Tuberculosis and Diseases of the Chest is as follows:

Charles D. Post, M.D., Chairman, 608 East Genesee Street, Syracuse

Louis C. Kress, M.D., State Department of Health, Albany

Nelson W. Strohm, M.D., 289 Linwood Avenue, Buffalo

Dental Health.—The educational program arranged by this Joint Committee appears in the Course Outline Book.

The Joint Committee on Dental Health has the

following members:

Medical Society of the State of New York:

O. W. H. Mitchell, M.D., Chairman, 428 Greenwood Place, Syracuse 10

Harry Aranow, M.D., 355 West 149 Street,

Bronx 55 Herbert H. Bauckus, M.D., 89 Bryant Street, Buffalo 9

Dental Society of the State of New York:

Charles M. McNeely, D.D.S., 1 Nevins Street

Brooklyn 17 Douglas B. Parker, M.D., D.D.S., 121 East 60

Street, New York 22 Leuman M. Waugh, D.D.S., 931 Fifth Avenue,

New York 21

War Medicine and Surgery.—This Subcommittee offers an educational program the same as last year's and several lectures were arranged for county medical societies. See report on "Postgraduate Education."

The membership of the Subcommittee on War

Medicine and Surgery is as follows:

O. W. H. Mitchell, M.D., Chairman, 428 Green-wood Place, Syracuse 10

Gustave Aufricht, M.D., 103 East 86 Street, New York 28 Louis H. Bauer, M.D., 503 Professional Building,

Hempstead

L. Whittington Gorham, M.D., 214 State Street,

Leonard Greenburg, M.D., 80 Centre Street, New York 13

Leo Mayer, M.D., 1150 Fifth Avenue, New York 28

James E. Perkins, M.D., State Department of Health, Albany 1

Byron Stookey, M.D., Neurological Institute, New York 32

Frederick S. Wetherell, M.D., 514 Medical Arts Building, Syracuse 2

Industrial Health.—The Study Committee on Industrial Health has the following membership:

Herbert H. Bauckus, M.D., Chairman, 89 Bryant Street, Buffalo 9

Robert K. Brewer, M.D., 865 Livingston Avenue, Syracuse 10

John H. Garlock, M.D., 50 East 77 Street, New York 21

David J. Kaliski, M.D., 292 Madison Avenue, New York 17

John S. Lawrence, M.D., 260 Crittenden Boulevard, Rochester 7

Edward S. Godfrey, Jr., M.D., Commissioner of Health, State Department of Health, Albany 1, ex officio

Leonard Greenburg, M.D., Executive Director, Division of Industrial Hygiene, State Department of Labor, 80 Centre Street, New York 13, ex officio

Each year the Council on Industrial Health of the American Medical Association has a conference in Chicago. The Council requested that the county medical societies appoint committees in this field.

During the past year, the Study Committee on Industrial Health wrote letters to the secretaries of the county medical societies and requested them to appoint committees or designate representatives in Industrial Health. To date, thirty-four of the sixty-one county medical societies have done this.

On June 24, 1943, in Buffalo, the Buffalo District Committee for Industrial Health held a Symposium on Wartime Nutrition. It was a very successful meeting and well attended. The Chairman of the Study Committee on Industrial Health is also Chairman of the Buffalo District Committee for Industrial Health.

The educational program of the Study Committee on Industrial Health appears in the Course Outline Book. Industrial medicine is also associated with many of the postgraduate education programs but is not so designated.

In answer to a letter received from Dr. Orlen J. Johnson, Council on Industrial Health, American Medical Association, on January 21, 1943, regarding the activities of the Study Committee on Industrial Health, the Chairman of the Council Committee on Public Health and Education replied as follows:

"In July, 1943, letters were written to the secretaries of the county medical societies stating that because of the increased interest and expansion of activities in Industrial Health, it was advisable that each county medical society appoint a committee on Industrial Health—either as a separate committee or as a subcommittee of the Committee on Public Health. To date, thirty-four of the sixty-one county medical societies have appointed committees or subcommittees on Industrial Health.

"As you know, the Council Committee on Public Health and Education conducts an active postgraduate program in connection with county raedical societies and sometimes other medical groups. Many meetings have been arranged during the past year. Several of these sessions should be considered part of our Industrial Health program but only one was so designated."

A list of the names of the chairmen of Industrial Health Committees in county medical societies was furnished the Council on Industrial Health of the American Medical Association.

Hard of Hearing and the Deaf.—The Subcommittee on Hard of Hearing and the Deaf reports that it is the accepted policy of the American Academy of Ophthalmology and Otolaryngology to have in each state a committee of two men who are to work through the county committees for the Hard of Hearing and the Deaf.

In New York State we are more fortunate than many other states in that we have legislation which when polished and activated would be effective in discovering the deaf and the hard-of-hearing child, as well as providing him with proper educational facilities.

The Subcommittee is endeavoring to correlate the activities of each county society into a general state movement to bring about, if possible, complete coverage for these handicapped youngsters.

The Subcommittee on the Hard of Hearing and the Deaf has the following members:

C. Stewart Nash, M.D., Chairman, 277 Alexander Street, Rochester 7

Ralph Almour, M.D., 71 East 80 Street, New York 21

John F. Fairbairn, M.D., 925 Delaware Avenue, Buffalo 9

Edmund Prince Fowler, M.D.,140 East 54 Street, New York 22

Blood and Plasma Exchange Bank.—At the annual meeting of the House of Delegates of the Medical Society of the State of New York held in Buffalo on May 3-4, 1943, the following resolution was passed:

"Resolved, that the Medical Society of the State of New York sponsor the extension of the activities of blood and plasma exchange banks throughout the State, with the view toward assisting and encouraging blood and plasma exchange banks to extend to the sick throughout the State, and even to our remotest communities, the benefits they are now rendering: and further be it

are now rendering; and further be it

"Resolved, that the Medical Society of the State
of New York refer this matter to a Council Committee or a Special Committee on Blood Transfusion to accomplish these aims."

A Subcommittee on the Blood and Plasma Exchange Bank was appointed by the President of the Medical Society of the State of New York; the membership is as follows: George M. Mackenzie, M.D., Chairman, Cooperstown; Morris Maslon, M.D., Glens Falls; Lester J. Unger, M.D., New York; ex officio: John J. Bourke, M.D., Office of Civilian Defense, New York; Edward S. Rogers, M.D., State Department of Health, Albany.

The Subcommittee and the Council Committee on Public Health and Education have held four meetings: June 24, July 15, August 19, and October 13, 1943. Representatives of the New York State Department of Health, the New York State Association of Public Health Laboratories, and others have attended one or more meetings and have generously given the Subcommittee the benefit of their advice.

The Subcommittee made an extensive study of blood and plasma banks now operating in New York State, exclusive of New York City. From the data collected and information provided by many physicians directly or indirectly concerned with such services, the Subcommittee submitted its report in December, 1943. This report, with the recommendations, was submitted to the Council at the meeting on December 9, 1943. The recommendations are as follows:

(a) Methods of Repayment.—The Subcommittee believes that a State-supported system of distribution, without charge, of blood or blood derivatives, similar to the system now operated by the New York State Department of Health for the distribution of sera and other biologicals, would be inadvisable.\*

The Subcommittee favors the principle of payment for blood and blood derivatives and recommends the cash-or-kind method. In this connection it should be noted that many banks report that attending physicians are often lax in getting the families of recipients to produce the donors for repayment, and that as a consequence the banks are frequently faced with a deficit. It is believed that with the cooperation of local physicians this system of repayment could be extended, at least for the distribution of plasma, to rural areas. It is recommended that each time a physician uses one or more units of plasma it would be his responsibility to collect cash or arrange with the family to send donors to the bank which had supplied him with plasma. The burden of collection should not be placed on the bank. Repayment in rural areas, when not made entirely in cash, would presumably be best accomplished in most instances by sending donors to the distributing centers in approved laboratories which would be equipped to collect blood and separate the The liquid plasma when desirable would then be sent to the New York State Department of Health; after desiccation it would be returned to the local bank.

(b) System of Distribution.—The Subcommittee recommends (1) that existing banks, wherever the need exists, increase their facilities for distribution of blood or blood derivatives within the areas they now serve; (2) that they study the possibilities of extending their services to adjacent territory. In some places this might be accomplished by allowing individual physicians to keep on hand one or more units of plasma; in other instances relations with smaller satellite hospitals might be established and these smaller institutions would then be provided with blood or plasma or both, depending on the facilities available at the satellite hospital; (3) that in areas which would not be reached by the system of distribution outlined in (1) and (2) the approved laboratory serving the area undertake the establishment of either a blood bank or a plasma bank, whichever in the opinion of the laboratory director seems more advisable. The Subcommittee suggests that banks of this kind, operating in sparsely settled areas, could increase their effectiveness by using

local health officers to aid in distribution. Each local health officer in such areas might constantly have on hand a small quantity of plasma. He could, if it seemed to him advisable, permit individual physicians to retain constantly one or two units of plasma.

(c) Role of the New York State Department of Health.—(1) The Subcommittee recommends that the Commissioner of Health, in addition to exercising general supervision of the blood and plasma banks of the State, shall establish such standards as he may consider desirable for the various procedures—bleeding, processing, preservation, preparation of equipment, blood grouping, etc.—involved in transfusion of blood or blood derivatives and that banks be required to meet these standards in order to be approved and that no bank be permitted to operate without the approval of the New York State Department of Health.

(2) The Subcommittee recommends that the New York State Department of Health secure the necessary equipment and personnel to desiccate plasma and that it be prepared to render this service free of charge for all the blood and plasma banks of New York State.

(3) The Subcommittee recommends that State aid, mediated by the New York State Department of Health, be made available throughout the State exclusive of New York City, (a) to defray the expenses of existing banks in extending their facilities, and (b) to defray the expenses of approved laboratories which meet the standard requirements established by the New York State Department of Health and indicate their intention to start banks. Once equipped, organized, and in operation the Subcommittee believes that the bank should, by a competently administered system of repayment, be self-supporting; but the Subcommittee recommends that the New York State Department of Health be designated as the authority to decide whether State aid shall be for equipment only or for the expenses of operation or for both.

(4) The Subcommittee recommends that the Commissioner of Health seek the necessary authorization and appropriation from the legislature to carry out the portion of the program, as outlined above, which is to be administered by the New York State Department of Health.

(d) Getting Started on the Expanded Program Recommended by the Subcommittee.—The Subcommittee has received tentative acquiescence from officials of the U.S. Office of Civilian Defense in the proposal that OCD frozen or dried plasma be loaned to the New York State Department of Health for distribution to existing banks willing to expand their transfusion facilities or to approved laboratories intending to organize banks. The Subcommittee has also been tentatively assured that until such time as the New York State Department of Health is prepared to receive and desiccate plasma the Strong Memorial Hospital in Rochester, New York, for a very small fee per unit, will undertake to render this service for blood and plasma banks of the State.

(e) Educational.—The Subcommittee wishes to emphasize the importance of a continuing educational program as an essential feature of an integrated system of blood and plasma banks in New York State. The Subcommittee recommends that the principal responsibility for the program of education in the use of blood and blood derivatives shall reside with the Council Committee on Public Health and Education and that in executing the program the Council Committee shall collaborate with the

<sup>\*</sup> Blood and plasma banks now operating in the State offer alternatives in methods of payment: (1) payment in cashthe amount charged should include a small service charge, (2) payment partly in cash and partly in blood donations by friends and relatives; (3) payment entirely by blood donations from relatives and friends of the recipient. Experience has shown a two for one ratio in repayments for blood or blood derivatives provided by the bank is usually necessary; this allows a margin for such contingencies as unusable blood, loss by breakage, failure to obtain repayment, less than a full unit obtained on bleeding donor.

New York State Department of Health. The Subcommittee also recommends that the directors of approved laboratories shall assume an important share of the responsibility for, and by individual consultations and other appropriate measures participate actively in, the local educational program.

Thus a three-cornered collaboration of the Council Committee, the State Department of Health, and the approved laboratories should, in addition to other educational activities, seek to enlist the active cooperation of the county medical societies in the program of professional and lay education in the newer knowledge of transfusions of blood and blood derivatives. The generous cooperation and assistance of the staffs of the medical schools of the State can be counted on for valuable contributions to the educational program.

These recommendations were approved by the Council. Copies of the "Report" were sent to the State Commissioner of Health, Dr. Edward S. Godfrey, Jr., and to the members of the Public Health Council of the State Department of Health.

#### PART V

#### Publications

The Publication Committee personnel during the year 1942-1943 has been:

Trustee, Thomas M. Brennan, M.D.,

Chairman. Brooklyn General Manager, Peter Irving, M.D. New York Treasurer, Kirby Dwight, M.D. New York Business Manager of Journal and

Directory, Dwight Anderson.... New York Literary Editor, Laurance D. Red-

way, M.D.....Ossining

Directory.—The Council referred for study to the Publication Committee the action of the House: "that if conditions at all warrant publication of a 1944 Directory this should be undertaken, and, furthermore, that all physicians in the military services should have an adequate listing of their contributions to the armed forces. Such a new Directory would be a sustainer of morale and also be of much practical value."

The Publication Committee gave extended study to possible production of a 1944 Directory and, in lieu of that, a "supplement." With many physicians in service from the State of New York, personal data would be often hard to obtain correctly. Also, difficulties of compilation would be enormously increased with the end result a matter of potential, unsatisfactory results. In particular, the publication of a "supplement" would be, it was thought by the Committee and the Council, unsatisfactory. The Council believes that "conditions" do not "warrant" publication of a 1944 Medical Directory of New York, New Jersey, and Connecticut.

Journal.—The New York State Journal of MEDICINE has been produced in the year 1943 in the usual fashion, but with exceptional attention to the need to cut down the use of paper. It became necessary to cut down the size by 1/4 inch in length and width, thus making narrower margins on the sheets. In addition, the Committee decided to narrow the margins still more by the increase of the actual type space by two picas both ways, north and south, and east and west! The net result has been paper saving and more printed words per issue.

The total pages were kept at ninety-six (with the Convention issue 128) until it became possible to

raise the content to 112 pages per issue beginning with the September 1, 1943, issue, still keeping within the allotted amount of paper. Use of paper of less weight per sheet had been begun in June, 1943.

The text content for the year ran along in about the same page fashion as in 1942. Of the whole 2,464 pages, 1,557 were text. Scientific articles to the number of 189 totaled 1,081 pages, with the remainder divided as follows:

Medical News	105 pages
Editorials	80 pages
Hospital News	56 pages
Book Reviews	43 pages
Honor Roll	26 pages
Postgraduate Education	16 pages
Medicine and the War	13 pages
Health News	13 pages
Index	12 pages
Correspondence	10 pages
Woman's Auxiliary	10 pages
Medicolegal	2 pages
Miscellaneous	19 pages
Also	• -
Annual Reports	72 pages
Minutes of Annual Meeting	65 pages

As to finances, the Business Manager, Mr. Dwight Anderson, has given the following report:

#### FINANCIAL REPORT

The operation of the Journal made an improvement of \$14,462.85 over 1942. In that year, the publication showed a deficit of \$8,367.27. In 1943 it showed a surplus of \$5,995.58. This figure is computed from the audits, before adding to income the sum of \$1.00 per year per member for subscriptions, as required by second-class postal regulations.

Subsequent to the death of Mr. Kent Lighty, advertising manager, in January, 1943, a settlement was made with his estate which is more particularly described in the report of the Treasurer of the Society. On May 1 the Society took over the management of its own advertising solicitation under the management of Mr. Anderson. Two advertising salesmen were employed: Mr. Gordon Marshall and Mr. Charles L. Baldwin, Jr.

In 1942, the Journal published advertising in the gross amount of \$89,870.27; in 1943, \$117,-733.20. The cost of selling, proportionately to the amount published, was slightly reduced under the

new plan.

It was decided to use the same setup for selling technical booth space at annual meetings, a matter which has been the responsibility of the Publication Committee for several years. Total sales for 1944 amount to approximately \$21,000. This is \$2,000 more than the last meeting in New York in 1942. The costs of selling space have been drastically reduced by this change, and a saving in 1944 shown of \$3,250 below what it would have cost to sell the same amount of space under the previous arrangement.

March 20, 1944

### Medical Publicity

This year publicity activities have been addressed principally to opposing the Wagner-Murray-Dingell bill and explaining medical indemnity insurance. Details will be found herein later under appropriate headings.

Releases .- Routine coverage with the press was continued throughout the year on meetings of dis-

trict branch societies and the postgraduate courses of the Committee on Public Health and Education. In connection with publicity for the Annual Meeting at Buffalo, circulars were prepared and distributed regarding the "War Medicine" features of the meeting. This is believed to have contributed to the unexpectedly large attendance at that meeting.

Bulletins.—The following bulletins have been distributed: No. 53, "Pneumonia"; No. 54, "Share Your Blood With the Boy Next Door"; No. 55, "It's Only Measles"; No. 56, "If It's Good Enough for Our Soldier Sons. . . ."; No. 57, "The Seven Old Graves"; No. 58, "Sniffles"; No. 59 "The Art of Doing Nothing"; No. 60, "All Cripples Don't Wear Braces"; No. 61, "The Answer to Socialized Medicine"; No. 62, "Examine Your Local Plan"; No. 63, "A Community Program for Women's Auxiliaries."

Printed Matter.—"Like a Letter From Home" is the title of a pamphlet which was distributed at the Annual Meeting at Buffalo and to the membership through county medical societies. It consisted of pictures illustrating activities of the profession in the war, and brief excerpts from letters from members regarding the value of the New York STATE Journal of Medicine to men in the armed service.

Wide distribution was given two leaflets issued in opposition to the Wagner-Murray-Dingell bill: "Old Doc Politics is Back Again," of which 119,065 copies were distributed as of March 1, 1944, and "It Can't Be Done," 60,881 copies. Not only did this material go to each member of the Society, but also to members of groups such as the New York County Lawyers' Association and Bar Association, Rotary and Lions Club members, Chambers of Commerce, social workers, dentists, teachers, preachers and influential churchmen, labor union leaders, farmers, nurses, and insurance men. Copies were supplied in bulk to members of the Society for redistribution, and to county societies and outside organizations for the same purpose.

Women's Auxiliary.—A special effort was made during the year to assist the Women's Auxiliaries throughout the State in identifying themselves more closely with public affairs affecting the practice of medicine. Miss Yolande Lyon, of Buffalo, joined the staff of the Public Relations Bureau September 1, 1943, as field representative. She has been prin-cipally engaged in this part of the Bureau's activities. She has received valued assistance in getting this work organized from Mrs. J. Leslie Sullivan, Mrs. Luther H. Kice, Mrs. Carlton E. Wertz, and Mrs. Jesse Levy.

Medical Indemnity Insurance.—Efforts to promote medical indemnity insurance during the past year indicate that the time has arrived when the membership is ready for wider participation in these It is proposed that the Public Relations Bureau address its principal attention during the coming year to popularizing this type of insurance, not only because it appears to be a way to defeat the socialization of medicine, but primarily because it meets a real need of the times in which we live.

#### PART VI

## Public Relations and Economics

The Council Committee on Public Relations and Economics continued with the same personnel:

Herbert H. Bauckus, M.D., Chairman...Buffalo Harry Aranow, M.D....Bronx
Charles M. Allaben, M.D...Binghamton The Committee presents the following report.

#### REPORT

Never before in the history of our country has it been so important that the people clearly understand the standards and the aims of the practitioners of medicine. We are fighting a world war abroad, we are producing and training for war on an all-out basis at home; inevitably the economic conditions presented by such a general social upheaval are most difficult to cope with, and really impossible to satisfactorily control. Here indeed, is the occasion for

tolerance and the time to stand by.

Again the medical profession finds its part in the winning of the war to be its most important work. To preserve the health and life of the men, and the women too, in the field: to safeguard their families and their workers here at home, are the greatest tasks ever to confront our practicing profession. The fact that approximately one-third of our physicians are being utilized in the active military service should indicate the magnitude of the planning needed to provide for adequate medical care. And yet our fighters and our nation at home have the best health experience there is in the world. We reflect with satisfaction on this picture, yet we must not forget that a large part of our membership is, for the duration at least, away from the deliberations and decisions of the organizations of medicine. Not only do these military physicians have a right to our fraternal interest, they deserve as well the appreciation of all our people, and especially do they merit a warm consideration by hospital managements and staffs.

The Public Relations and Economics Committee personnel have kept in close touch with the work of

the Committee on War Participation.

It has followed carefully the detailed discussions of the new Planning Committee for Medical Policies which, by command of the 1943 House of Delegates, was directed to consider the following:

The distribution of physicians.

Educational requirements for licensure.

Voluntary insurance plans and other plans for 3. decreasing the costs of medical care.

Socializing influences.

Relationships of the medical profession with government agencies, commercial laboratories, and vendors concerned with any phase of

The relationship of hospitals and the practice

of medicine.

Relationships with and the status of the nurs-

ing profession.

Such other matters as the committee deems important from the standpoint of protecting the public and the medical profession from attempts to bring about inadequate medical care and unwarranted interference by outside agencies with the practice of medicine.

Reference is respectfully made to the report of this long-range special Planning Committee for Medical Policies. (See April 15 issue.)

The Committee met on several occasions with the Public Health and Education Committee in cooperation with the wishes of the chairman, Dr. O. W. H. Mitchell. It entered closely into the study of the Emergency Maternity and Infant Care (E.M.I.C.) Program of the Federal Government and the New

York State Department of Health. It studied the important question of the School Health Program as presented by the Public Health and Education Committee.

The Committee found that especially this year the Workmen's Compensation Bureau has become an important factor in our professional and economic relations with industrial workers in New York State.

The Council Committee on Legislation presented much material that required analysis and study. The attendance of the Executive Officer, Dr. Joseph S. Lawrence, at the meeting was most helpful.

The chairman of the Committee continued contact with the New York State Nursing Council for War Service and has received reports regularly

from this organization.

He also continued as a member of the Atlantic Seaboard Agricultural Workers Health Association. Inc. The purpose of this board, supported by federal funds, is to provide medical care for indigent migratory workers.

The committee received a report from Attorney Thomas H. Clearwater that provided material for study relating to the legal definitions of what con-

stitutes medical care.

During the year the committee studied various proposals relating to the newer developments in the socialization of medicine. The Beveridge Plan of England and the Provincial Health Insurance Act of Canada and the developments in New Zealand were studied in relation to the proposed Wagner-Murray-Dingell bill in the United States.

The subject of Medical Relief has remained under

consideration of the subcommittee:

Ralph T. Todd, M.D. Tarrytown Carlton E. Wertz, M.D. Buffalo Charles F. Rourke, M.D. Schenectady

The Subcommittee reports as follows:

#### REPORT

With the decrease of unemployment in New York State, the Department of Social Welfare has been relieved of many of the perplexing problems which directly or indirectly influence the medical care provided by this Department and rendered by the medical profession. It follows, therefore, that the Committee on Medical Relief has been relatively quiet this past year; however, your Committee has maintained close association with the Department of

Welfare during this period.

At a meeting held in the summer with the Department's representatives the question of payment of medical fees for services rendered to Old Age Assistance clients was discussed. Unfortunately your Committee is unable to report any change in the method of payment of the doctors giving this service; however, we are able to report that the Social Welfare Department informed us of the removal of certain restrictions formerly placed on participating practitioners in the care of welfare patients and in the prescribing of medicine for these clients. It was stated at this time that the removal of these restrictions was made possible by the efficiency of the medical service rendered under the agreement made in 1942 by the Department of Social Welfare of New York and the Medical Society of the State of New York

An informal meeting was held with the newly appointed Commissioner of Social Welfare, Robert T. Iansdale. Many mutual problems were discussed and the future looks hopeful, for greater understanding ing, cooperation, and coordination between government and the medical profession exist today than before.

Your Committee looks forward to greater activity in the coming year and the work should prove to be not only interesting but of great value to the doctors, the citizens, and the State.

#### PART VII

#### Nonprofit Medical Expense Insurance

The main work of the Committee on Public Relations and Economics consisted in the study and support of voluntary prepayment nonprofit medical care insurance plans in New York State. Part of the discussions related to the fact that voluntary prepayment insurance would be one important answer

to the Wagner-Murray-Dingell bill.

The Subcommittee on Nonprofit Medical Expense Insurance continued with the same personnel:

Herbert H. Bauckus, M.D., Chairman...Buffalo Walter T. Dannreuther, M.D.....New York William Hale, M.D......Utica

It also continued an additional subcommittee to study and advise on the subject as it pertains to the metropolitan New York area and the surrounding counties (seventeen in all). This personnel is as follows:

William B. Rawls, M.D., Chairman... New York Walter T. Dannreuther, M.D.... New York Abraham Koplowitz, M.D... Brooklyn Milton J. Goodfriend, M.D.....Bronx

The following is the subcommittee's report.

#### REPORT

The metropolitan Subcommittee busied itself with the voluntary medical care plans of the above area and has met with some success with three New York City plans: Medical Expense Fund, Inc.; Community Care, Inc.; and Plan B of the Kingsley Roberts group. The other voluntary medical care plans in New York State are the Medical and Surgical Care, Inc., of Utica, New York, and the Western New York Medical Plan.

During the year the chairman of the Public Relations and Economics Committee discussed the subject of nonprofit medical expense insurance plans in New York State with His Excellency Gov. Thomas E. Dewey and followed this with the forwarding of the printed material of each New York State plan

to the Executive Office.

A meeting with the New York State Superintendent of Insurance, Mr. Robert E. Dineen, was attended by the chairman and the executive officer, Dr. Joseph S. Lawrence. During the year the Publications Committee sent out considerable helpful material on the subject of Voluntary Medical Care Insurance and this will be augmented by fur-ther important bulletins. Miss Yolande Lyon was added to Mr. Anderson's office staff to assist in this work. Miss Lyon has been spending time in interesting the Woman's Auxiliary of the State Medical Society on the subject of Voluntary Medical Care

Under date of December 9, 1943, the chairman made the following report to the Council:

"Voluntary Nonprofit Medical Indemnity Insurance Plans in New York

"Although these plans have enjoyed but a limited experience in New York State, they have attracted enough support on the part of subscriberpatient and physician to enable us to draw certain important conclusions from them.

"There is a great desire on the part of the public to budget and insure against the costs of medical care. Some of this foresight has been stimulated by the success of hospitalization insurance. This directs attention to the insurance of hospital-confining illness, and thus, logically,

to the surgical care contract.
"The public has a greater interest in the selection of quality medical care than we are inclined to give it credit for. It does not want to take chances with experiments that might interrupt the consistent progress in American medicine. It is satisfied and as a country it is quite proud of these achievements. It does not foresee anything but disadvantage in the entrance of a third party to the patient-physician relationship. It most certainly fears and despises the admixture of politics into medicine—and especially does it abhor political welfare medicine. It wants to be unhampered in the choice of its physicians—it still does not want to give up the vantage of being the employer.

'The philosophy that would burn the bridges of the old stand-by medical services behind us is not considered seriously, and its superficial interest disappears at once when the advent of real sickness prompts the family to send for their doctor. The public unerringly senses that the physician is a human, too, and that competition

does ever so much for initiative.

"But how to save for the cost of the inevitably

needed medical care!

"Better yet, by insurance make the necessary funds available at once and at the same time spread the cost over time and numbers!

"And, more than all this, to impress the individual with the personal responsibility of every one of us to preserve health and life, and to safe-guard against sickness! Without this education, most assuredly, we shall not progress under any

system.
"Are the personal hardships of our pioneering days over? Why, today the youth of our land are out there in the far, far away, battling fiercely with and among the most destructive and deadly machines in the history of mankind! And though they are part of a great combined host they think, and they experience mental and physical woundsand, yes, they die—as individuals.

"Seven to ten cents per day per individual will adequately insure for medical and hospital care

combined!

"A broad surgical contract costs two cents per day

per individual!
"A surgical contract with obstetrics costs one dollar and seventy cents per month for the family! "A liberal medical and surgical contract, with

obstetric care, costs three dollars per month for the entire family!"

A study of the various plans of New York State shows that they are all making progress and growing, but it is quite evident that there are many difficulties which prevent a rapid acceptance of these plans by the public. All insurance apparently requires good salesmanship. Medical care insurance is unquestionably in the experimental development stage and it is, as well, a most difficult problem from the standpoint of securing helpful actuarial data. The problem goes into the field of what we can insure in health and what we can not in a general policy afford to insure. How well is a person who has

no symptoms? And what symptoms, granted even that they be displayed by nervous and neurotic temperaments, can we regard as having no need for medical attention? If we demand signs, then a physical examination is necessary and for this, in the mind of the patient at least, the medical care plan should make payment. Logically, we should make all the use we can of preventive procedures, but since these have to do with practically all people we could not enjoy the advantage of spreading the risk among the many for the benefit of the few. Also, if we put an additional burden on the subscriber-patient for the first few calls in order to discourage unnecessary demands then we are risking our position in advising early medical care. If we attempt to insure only for the serious or catastrophic illness we are not at all fulfilling the public demand and need for coverage of the greatest portion of the population. Again, the apparently minor illness may later become the tragic catastrophe. Really, the possibilities in medical care insurance vary over as wide a field as does the pathology of the human body. Manifestly, there must always be a limit in the coverage of any kind of medical care plan-government-operated or not. And the more one studies the practical workings of the plans the more clearly does this become evident. Unfortunately, many lay groups, including labor organizations, believe that an ideal plan should cover all medical care at a fixed annual premium. It might be possible to do this on a perfunctory basis, but not without serious loss to the high standards of good medical care. It goes without saying that the rank and file of our physicians will not enter into a system for providing the cost of medical care which interferes with or prevents the best in progressive modern medicine.

The question of insuring the lower income groups is of course very important. Some of the plans endeavor to reduce the cost to this group. Admirable as this may be, it brings with it many difficulties and in the end the welfare groups are apt to receive the old familiar welfare medicine. There seems no good reason why social welfare boards should discriminate by purchasing inferior or low cost medical care for those entrusted to their responsibility. It is true that this care could be purchased at a lower rate by including all these patients as a group, and this, together with lack of collection difficulties, should make a low premium rate acceptable to the practicing physician. For the present, it seems that a broad surgical contract with obstetrics, to which may be added liberal medical coverage for an additional premium and which will insure the entire family on a limited indemnity basis, covers the field as well as is possible with our present knowledge. From this, of course, we can improve and make the contracts broader and more liberal from year to year, but we must start with a practical basis both for the patient and the physician. It should be mentioned that the difference between "service" and "indemnity" is that "service" includes all the care demanded or necessary, whereas "indemnity" limits the benefits, as is the case with most of the socalled commercial surgical contracts. The wellknown health and accident insurance contracts usually pay a specified amount for a certain restricted period. Mention should be made here that the unrestricted old-time health and accident policy for permanent disability is no longer sold, because experience has shown that such companies could not continue as a successful financial venture. inclusive unlimited service medical care plans, voluntary or compulsory, fall in this same category.

The Medical Society of the State of New York should do all in its power to make sensible and workable Voluntary Nonprofit Medical Indemnity Insurance Plans available to the residents of its State. In conformity with this idea the Council Committee on Public Relations and Economics of the Medical Society of the State of New York at a meeting February 9, 1944, adopted the following resolution:

"Resolved, that a full-time Director for Medical Indemnity Insurance be appointed for the Medical Society of the State of New York.

The chairman read from his report to the Council as of January 28, 1944, as follows:

"The time is at hand for a realistic approach to a more active sponsorship of our voluntary prepayment plans for medical care insurance. As a state medical society we are committed to the active support of these plans—and the events of the past year demand that these efforts be greatly accelerated and expanded.

"Any worth-while effort will require the expenditure of additional money by the Medical

Society of the State of New York.

"The business of Workmen's Compensation has for some years entailed the budget support of a director and a bureau or division, with the need for greater activity and completeness plainly shown by the latest report of the Committee

"The successful promotion and sponsorship of voluntary prepayment insurance will be a much heavier activity. We need a full-time director in this work to study and directly aid the plans now

operating in our State.

"We should consider the advisability of augmenting the selling and advertising forces of the plans operating in the three areas of the state. This would not cost as much as would the formation of a new state-wide plan, which would have many difficulties aside from newness. The expansion of area plans would soon cover the needs of the entire state.

"We should now finance and support a New York State Medical Society Bureau for Volun-

tary Medical Care Insurance.
"The adoption of these steps would inevitably result in a most favorable public reaction and should win approval from all quarters. We must not overlook the fact that the many lay minds who are with us heart and soul to preserve the scientific advancement of medicine also look to us for constructive leadership in the problems of health economics.

The Council was quite sympathetic to the idea of further Indemnity Insurance Plan expansion and referred the subject to the Planning Committee for Medical Policies. This Committee met on February 10, 1944, and was equally desirous of cooperation in this Medical Care expansion.

It is considering special details looking toward a definite proposal for the House in its report to come

later.

Related to Voluntary Medical Care Plan development is the threat of competition from Blue Cross Hospitalization Plans. The State Committee for Uniform Contract of these plans wishes to include quite generally certain medical services in the hospitalization insurance plan. To this question the Council Committee on Public Relations and Economics has delegated a great deal of its time. Meetings were held with a committee of Blue Cross or Hospitalization Insurance Plans representing the New York State Conference of Blue Cross Plans, and with the Hospital Association of the State of New York.

Under date of August 14, 1943, the following letter was addressed to the president of the Medical Society of each county:

#### 'Dear Doctor:

"At a recent meeting of the Council of the Medical Society of the State of New York, careful consideration was given to the subject of voluntary nonprofit hospital insurance corporations seeking to include anesthesia and x-ray services in the hospitalization contract.
"A report of the Reference Committee of the

June, 1943, House of Delegates of the American Medical Association was read to the Council. The Council of the Medical Society of the State of New York unanimously passed a resolution adopting these principles or resolutions of the American Medical Association as its own policy.

"We accompany this communication with a copy of the above resolutions of the American Medical Association, and ask that this copy be read at the next meeting of your county society.

"I would like to suggest that the subject be made the interest of the various medical hospital staffs of your county. Physicians understand that the services of x-ray and anesthesia are part of the practice of medicine; but there is difficulty in securing the adherence of legal opinion to this belief. The various hospitalization insurance corporations of New York and other states are seeking to bring out a uniform hospitalization contract which may result in much dislocation of home theory and rule in medical care and hospital management.

"The Council Committee on Public Relations and Economics will communicate with you further on the subject. It wishes to emphasize that it is the action of local county societies that will bear the most weight with the hospitalization plan of its community. I shall appreciate your immediate

comments and suggestions.

"Very truly yours,

HERBERT H. BAUCKUS, M.D., Chairman Council Committee on Public Relations and Economics"

This letter was accompanied by excerpts from the report of the House of Delegates of the American Medical Association, as follows:

"1. That the House emphatically reiterate that it disapproves the injecting of a third party into the personal relationship of the patient and the physician, and that hospitals should not be permitted to practice medicine.

"2. That the practice of radiology, pathology, and anesthesiology is the practice of medicine just as much as is the practice of surgery or internal medicine, and that it is only a short step from including the first three in a medical service plan to including the whole field

of medicine in such a plan.

"3. That the public should be educated to realize that the hospital-created monopoly control of radiologic or any service as a source of profit beyond the normal provision for replacement, department development, and proper proportion of over-all costs of operation of the hospital should not be permitted. Nor can the hospital rightfully use per diem charges

against all of the hospital patients to support a radiologic or other department devoted to creating bargains in radiologic or other services in order to make hospital group insurance more attractive. To permit either will result in decrease of the quality of service and increased cost to the patient.

"4. The medical profession must watch with care all proposed plans for medical service and endeavor to prevent the acceptance of any plan which includes medical service under the

control of the hospital.

"5. The effectiveness of this program can be attained only if state and county medical societies use their influence on hospitals in their respective localities and exercise control over the local members of the medical profession.

"6. The public must be educated on what it will mean to them in the way of inferior medical care if these dangerous trends are not curbed.

"7. In the relationships of the medical staff and the board of directors of a hospital there should be no intermediary. The staff should have direct access to the board.

"8. The board of trustees should continue their conferences with national hospital associations and should also endeavor to enlist the support of special medical organizations in education both of the profession and of the

public.

The House of Delegates of the American Medical Association urges the American Hospital Association to withhold approval of the uniform comprehensive Blue Cross contract proposed by the Hospital Service Plan Commission of the American Hospital Service Association, which includes certain medical services as a part of hospital care and which, if adopted as recommended by the said Commission, would virtually compel the addition of medical services to the benefits of those Blue Cross Plans now acceding to the demands of the American Medical Association by confining their benefits to hospital serv-

On December 9, 1943, the chairman of the Public Relations and Economics Committee presented the following report to the Council:

"Hospitalization insurance plans known as the Blue Cross have indicated a desire to broaden the scope of their plans by insuring for certain medical service costs incurred in the hospital. Some of the reasons for this change appear to me as follows:

"1. Increase of their profits and surplus have necessitated or made desirable an increase of benefit distribution.

(The plans are nonprofit.)

"2. Competition of commercial or profit com-

panies.

"3. Business advantages of uniform contracts in the state and national organization of such hospitalization plans.

"4. Greater power of large nation-wide corporations in controlling all these plans.

"5. Desire of hospitalized patients to have all of the hospital bill paid by insurance.

"6. Possibilities in the control of medical services given in hospitals, and of the hospitals themselves. The money furnishing the lifeblood of the hospital, and of the medical service, would come from the Blue Cross.

"Against this encroachment the medical profession of New York State has objected largely on the following basis:

"1. It has not been thought wise, and it is not legal, for a corporation to practice medicine. The public still looks to individual responsibility in the acts of medical practice.

"2. It would deteriorate the standards of medical care in hospitals, leading as well to deteri-

oration of hospital service.

"3. It would reduce the standing of certain important specialties in medicine to the point where the qualifying boards for such specialties would see their work destroyed.

"4. It overlooks the fact that a large and important part of the practice of medicine is outside of the hospital, especially in the prevention of serious disease requiring hospitalization.

"5. It would directly compete with and would

destroy voluntary medical plans.

"6. It is necessary to have both medical care and hospital plans, as neither alone can satisfy the public demand for insurance. Omission of completeness plays directly into the hands of advocates of compulsory sickness insurance.

"7. The Blue Cross plans being older, having amassed satisfactory funds, and having had the help and cooperation of the medical profession from the inception of these plans, may reasonably be expected to assist in the support of the more difficult medical care

plans.
The medical profession does not like the idea of a third party interference in its relations with the hospitals, especially in the case of large state and national organizations which may have little understanding of home rule and option.

"9. It feels that the present addition of a few specialties will lead to the inclusion of more medical services, especially surgery and ob-

stetrics.

"10. It sees many other benefits than the practice of medicine that could be introduced into the hospital plans to give the subscriber greater benefits."

The Public Relations and Economics Committee on February 10, 1944, presented a resolution to the Council which was adopted by that body as follows:

"That the Council of the Medical Society of the State of New York reaffirms its own position and that of the American Medical Association in opposing the inclusion of pathology, radiology, anesthesia, physical therapy, or any other form of the practice of medicine in a voluntary hospitalization or Blue Cross Insurance Plan. It is opposed to hospitals' accepting contracts of this kind, and it proposes that these insurance contracts for medical services be cared for by the voluntary nonprofit medical care plan."

The Council authorized the committee to publicize this information and forthwith copies of the resolution were mailed to the medical societies of each county, to the Hospital Association of New York State, to the New York State Conference on Blue Cross Plans, to the Blue Cross Plans operating in New York State and to the Boards of Trustees and New York State, and to the Boards of Trustees and the medical staffs of the hospitals of the State of New York.

#### PART VIII

#### Legislation

The Council Committee, charged with the duty of studying legislation and putting forth the positions taken by the Society, was continued with the same personnel:

John L. Bauer, M.D., Chairman......Brooklyn Walter W. Mott, M.D......White Plains Leo F. Simpson, M.D.....Rochester

The Committee makes the following report as of March 11, 1944. A supplementary full report will be ready for the House on May 8, 1944.

The Council Committee on Legislation submits

respectfully the following preliminary report.

There have been meetings and conferences in Rochester, Albany, and New York City; also many conferences over the telephone. This year the county legislative chairmen held a conference with the State Legislative Committee in December as well as in February. Both were well attended; thirty-three counties were represented in December and thirty-four counties in February. One returns home from these conferences with a better understanding of the problems involved, with a sense of good will and fellowship and a real pride in his fellow physicians. The contacts with the legislators have been enjoyable and, in many instances, a resulting increased respect and regard has occurred. Our Executive Officer is accepted at full face value; we have been fighting the good fight. We have had worthy opposition which is not always understood by us, especially opposition to us when we are fighting with full knowledge of the benefits to be gained by the people for their especial protection and safety. Political opposition may be generous and of good intent. It may be obnoxious or based on wishful thinking. How true and human it is to on wishful thinking. How true and human it is to credit legislators with honest convictions, when you get better acquainted with them.

Chiropractic and Basic Science Laws.—You recall that the Legislature appointed a committee to study the merits of chiropractic. We rejoiced that now the complete story would be told; all of the facts, true and false, would be brought out. This Committee and false, would be brought out. mittee would read the report of the State Department of Health for 1936, would carefully weigh it, since to date the standards of chiropractic have not been improved. We were certain that the claims of the chiropractors would prove to be fallacious, erroneous allegations, as we know them to be. it was realized that the appointment of a committee to study chiropractic might be a clever ruse to secure, after yearly failures, positive, favorable action for the chiropractors, so that they might become licensed without meeting the standards of the Medical Practice Act and without passing examina-tions in the Basic Sciences. But we still had faith in the sincerity and competence of the committee, even after we were acquainted with its composition. No one doubted that the legislators would feel their responsibility to the people, to the Board of Regents, and to the Department of Education. They could not possibly permit a lowering of the standards of the Medical Practice Act and so allow not welleducated men, men more or less ignorant of the Healing Art, illegal practitioners of the so-called chiropractic, to become licensed. This committee held six hearings. There was representation at five hearings from the Department of Education or from hearings from the Department of Education or from

the Department of Health of the State or of the City of New York, or from the Academy of Medicine of New York City, or of the Podiatry Association or of individual physicians, or of our Executive Officer, Dr. Joseph Lawrence. Abundant testimony was given to prove the case against the chiropractors. Chiropractic—not a science—not taught by any school or college worthy of regulation with the Department of Education—not recognized by the U.S. Army, or by the Navy, or the Marine Corps, or by any real widely accredited authority on pathology or physiology or anatomy or roentgenology, etc.—or by any hospital of standing, accepting any chiropractor on its staff. We were wary of some members of the committee, because of their record, yet we expected the report with recommendations to be given to the Legislature before the introduction

So far, we have seen no report, but a bill has already been introduced into the Assembly by the secretary of this committee and into the Senate by its chairman. These bills recommend licensure and a separate examining board for chiropractic, including what purports to be a "Grandfather's Clause." Do you recall the "Costs of Medical Care" and predetermined conclusions? We are still relying upon the Legislature as a whole. Surely, they must not be so gullible—they must await the full stenotyped report before they will vote for the lowering of the standards which our Medical Practice Act includes and compels-standards which have been advanced over the years, always higher, never lower. They must safeguard their Public. They must not shirk their responsibility. It is easier to believe that they realize their responsibility, and that the bills will be voted down. It would not be surprising to learn that the legislators have recommended, by resolution, the continuance of "equal standards of education and training for all who would practice upon the human body, regardless of what they call themselves."

Dr. George W. Cottis, the then retiring president, avored the appointment of a subcommittee to study the merits of the Basic Science Laws. Dr. Thomas A. McGoldrick, our President, recom-mended the appointment of a subcommittee to study chiropractic, in order to be equipped with full knowledge when testimony would be given at the hearings. The Council appointed Dr. Leo F. Simpson, chairman of the subcommittee on Basic Sciences, and Dr. Ralph T. Todd, chairman on chiropractic. These subcommittees reported to the Council. Dr. Leo F. Simpson in his report emphasized that the educational requirements demanded for licensure to practice medicine or the Healing Art should be met by all candidates. These standards should not be lowered. A Basic Science Law is not needed to curb the activities of the various illegal cultists. A proper enforcement of the law, as it now exists, would be entirely adequate. If a bill for licensing chiropractors, with a separate examining board, were introduced-then only should a Basic Science Law be enacted.

Dr. Ralph Todd, for his subcommittee on chiropractic, reported to the Council that the standards for those who practice medicine should ever reach for higher levels, never for lower ones. All who practice the Healing Art in the State should meet the qualifications as set down in the laws and the regulations of the medical and osteopathic prac-titioners. The American citizen expects, as his right, the best possible preparation and the greatest skill of those practicing the Healing Art. The maintenance of high uniform standards for all medical practitioners is insisted upon.

These reports were approved by the Council.

At the conference held in Albany on February 24, after long debate on both the Basic Science Law and chiropractic, a motion was carried instructing the State Legislative Committee to prepare and offer amendments to the chiropractic bills. This has been done.

Workmen's Compensation.—The report of the Moreland Act Commissioners William F. Bleakley and Herman Stichman, investigating the problems of Workmen's Compensation, has been made, but we have as yet seen only the recommendations of that report as printed by the Legislative Index Company. There will be a hearing on that report on March 13. A number of bills had already been introduced during February and others are appearing—many, no doubt, will be drafted and introduced almost daily—to amend the Workmen's Compensation Act.

Pending Legislation.—The Reregistration bill, calling for registration every two years with a payment of four dollars, has been amended to place initiating responsibility upon the State Department of Education. The unfortunate doctor has discovered too late his failure to register and has been severely penalized.

Tuberculosis is being taken into high gear, and will be dealt a lethal blow, if the present series of bills be passed—of course, additional State tuberculosis hospitals will be erected sooner or later.

The Governor's recommendation of a committee to study welfare progress and medical care will be authorized.

The Long Range Health Commission will be continued.

A most encouraging report has come from the Grievance Committee, suggesting a satisfactory state of affairs—but the powers that be are still for a "Hearing Officer," and a "Hearing Officer" it will probably be. Are there not a thousand cases to act upon as a result of the Workmen's Compensation Investigation, and a Hearing Officer is supposed to

make possible expeditious handling of these cases! We all want a full citizenship bill, and this has been mandated by the House of Delegates. As of February 1, 1944, the Department of Education drafted an amendment to the law, requiring full citizenship of all who would take the examinations for medical licensure. Assemblyman Lawrence agreed to take upon himself the job of sponsorship. The leaders of the Legislature are advising him against such action until next year.

We are possibly the only group opposed to feesplitting, and such things. We have introduced a bill covering fee-splitting, not only in workmen's compensation cases, but also in all branches of prac-

The Wicks Senate Bill on optical dispensing is approved by all of us—no misleading titles, no unlicensed and unqualified persons—no advertising, etc. A good bill, rather optimistic when we think of the illegal practicing of chiropractors—surely the eye is most important, but so is the whole body.

A good x-ray bill is offered and supported by the profession. We understand that the roentgenologists are awake to the needs of their own urgent efforts in support of this bill. The passage of this bill would be a real advance for the welfare of patients.

Other bills will be covered in the supplementary report.

The bulletins issued by our Executive Officer

should be read and referred to as needed. The extra conference of the county legislative chairmen and the State Legislative Committee held this year in December, previous to the session of the Legislature, was a valuable, informative, and influential meeting. We met in the morning, and the secretaries of the county societies who held their conferences the same afternoon, also met with us. Dr. Lawrence reported on the progress of the hearings of the committee of the Legislature on chiropractic. Dr. Louis Bauer interpreted the A.M.A. Council action on Medical Service and Public Relations. Dr. Sullivan informed us as to the present status of licensure of foreign physicians. The Wagner-Murray-Dingell bill was not slighted. Legislative committees' programs, Woman's Auxiliary programs, and a report of the Public Relations Department of the Medical Society of the State of New York by Miss Yolande Lyon, in person, were discussed and well received.

The Legislature is slated to adjourn before March 25. This report! is written on March 12,

#### 'PART IX

#### Workmen's Compensation

The Council Committee on Workmen's Compensation—Dr. Clarence G. Bandler, Chairman, New York; Dr. Joseph C. O'Gorman, Buffalo; Dr. David J. Kaliski, New York (also director of the Workmen's Compensation Bureau of the State Society)—has submitted the following report.

#### REPORT

The Committee on Workmen's Compensation believes that it is time to take stock of the administration of the Workmen's Compensation Law, especially since 1935, when this law was amended to regulate medical practice to provide "more adequate medical care for the injured workman" and to eliminate abuses and evils which existed up to that time. How well has the amended law worked out in the interest of the injured or disabled worker? How effective have been the provisions of the new law in abating evils and abuses known to exist? How satisfactorily have the medical societies carried out their duties and responsibilities?

The Workmen's Compensation Law was enacted primarily to vouchsafe to the workers of the State of New York prompt and good-quality medical and surgical care for injuries and illnesses arising out of and in the course of their employment, and to compensate them for disabilities. The cost of both medical care and compensation, while borne directly by the employer, is actually a charge against the consuming public. Inferior medical care results in prolonged disability, thus increasing the cost of medical care. It may also result in greater functional disability, not only increasing medical and compensation costs but also decreasing the future earning capacity of the worker, especially if he is a skilled worker.

So far as the medical profession is concerned, it has always believed that the same high average quality of medical and surgical care that the private patient receives should be assured to the injured worker. To this end we advocated free choice of physician for the worker and adequate remuneration

for the doctor.

In the past there was a stigma attached to work-men's compensation practice, largely due to competi-

tive compensation clinics, "commercial" doctors, control over medical practice by insurance carriers and employers, and the intrusion of lay-owned clinics and commercial x-ray laboratories in the medical field. Many of the best-qualified physicians hesitated or refused to accept compensation claimants as patients, leaving the field open to many of the less ethical or desirable types of practitioners, who often made compensation medicine a business and were not loathe to adopt unethical methods of the shady businessman to get "business," retain it, and even make a racket of it.

How to abate these evils and introduce into the field of industrial medicine and compensation practice well-qualified and ethical practitioners was the real problem that confronted the profession in 1933, when Governor Lehman appointed the Committee on Workmen's Compensation, on which half of the members of the committee of ten were appointees of the State Medical Society. In order to evaluate present-day conditions as compared with those which existed prior to the 1935 amendments, it is necessary to quote briefly from the report of the Governor's Committee and then to give our opinion as to the adequacy of the present law and the need for further changes in it.

The report of the Committee on Workmen's Compensation appointed by Governor Lehman, of which Dr. Eugene H. Pool was chairman, listed abuses which were subdivided into those over which they believed the medical profession had at the time no control, and those attributable to the medical profession. It was asserted that the Workmen's Compensation Law had not worked to the benefit of the injured workingman and that he often failed to get proper medical care. Racketeering had become notorious. Unscrupulous industrial clinics controlled by laymen or unethical physicians conspired with unscrupulous lawyers, claim representatives, employers, or insurance carriers to obtain compensation cases by rebating and other unethical practices. In order to cover the cost of these rebates, or kickbacks, treatment was needlessly prolonged and medical bills were excessive. The cost of insurance to the honest employer was increased and insurance carriers could not properly estimate the cost of insurance. Previous governmental investigations had also disclosed evidences of abuses on the part of practically all interested parties.

Included among abuses over which the medical profession had no control was the hiring of cheap and incompetent medical service by employers and in-surance carriers and the payment of inordinately low fees for medical service by some carriers, employers, and even the State Insurance Fund. seemed to be the purpose of the insurance carriers and employers to obtain the cheapest possible medical service; even hospital rates were lower than the actual cost of hospitalization in order to obtain business on the part of certain hospitals. Case lifting the control of the control lifting was common where the carrier directly employed physicians or controlled them. Improper medical testimony frequently resulted in erroneous decisions on causal relationship, to the disadvantage of the employee. In other instances conditions totally unrelated to the accident were held compensable. Difficult decisions concerning causal relationship were decided by lay referees without proper legal training and with inadequate medical background and experience, which resulted in unjust decisions. Frequently delays occurred in the hearing of cases and the granting of compensation, to the detriment of the injured workingman. The principal witness against the injured workingman was frequently the physician who treated him and who was paid and controlled by the insurance carrier or employer. The injured workingman was usually in no position to pay for highly skilled, expert medical opinions, while the insurance carriers were in a position to do so; hence the decisions of the referees were often one-sided.

Certain abuses were held to be attributable to the medical profession. It was felt that many serious injuries requiring specialistic care and attention were treated by physicians unqualified for the task. Overtreatment and overcharging were common and prolongation of the period of compensation was frequent. Physical therapy treatment was frequently given without medical supervision and was unnecessarily prolonged, thus adding to the medical cost and occasionally delaying the return of the injured workingman to his job. Physicians were disinclined to appear before referees to render medical testimony because they were not paid to testify and lost considerable time from practice at these hearings. Medical advertising and other forms of racketeering in order to secure patients flourished, especially on the part of the so-called compensation clinics. Rivalry between compensation clinics resulted in case lifting and other unethical practices. Many of the compensation clinics were inadequately staffed and equipped and often were unsanitary. Compensation medical clinics were often lay-owned and staffed by poorly paid and incompetent doctors and nurses. It was alleged that treatment was often rendered by unlicensed persons. These and other abuses had been repeatedly revealed by special committees of the Department of Labor, Bar Associations, Governor Roosevelt's Compensation Committee, and were to a certain extent confirmed by the investigations of the Pool Committee.

As a result of these abuses certain recommendations were made which were designed to regulate medical practice so as to provide more adequate medical and surgical care and to eliminate the evils which existed.

The chief recommendation was free choice of physician by the employee. It was hoped that the principal abuses as they affected the workman's medical case could be abated by granting to him the right to choose a physician, under certain limitations and safeguards designed to assure high quality medical care and to protect the employer and insurance carrier against excessive costs. At the same time, provisions were recommended to permit an employee, of his own free will, to accept the services of an enrolled physician selected and engaged by the employer and recommended by him. It was realized that steps would have to be taken to acquaint the injured employee with his right to choose his own physician or to transfer to one of his own choice. A provision was recommended to enroll all physicians through the county medical societies or their compensation boards. For the first time physicians were required to indicate in their applications to practice the scope of their medical practice based upon experience in medical practice and training. Physicians were bound by law to limit their professional activities to such conditions which, for example, a general practitioner was competent to treat, and, in the case of a specialist, to his special field. No physician was to be authorized without the scrutiny of the Workmen's Compensation Committee or Board before being recommended to the industrial commissioner for enrollment on the panel. Insurance carriers were denied the right to participate in the medical care of the worker. Employers and insurance carriers were, however, given the right to have the claimant examined periodically by competent medical examiners. Provisions were also included to permit an employer or carrier to transfer a patient from an unqualified physician to a qualified one under certain rules and regulations designed to prevent so-called case lifting or improper transfer.

For the first time the county medical societies, through the appointment of compensation committees, were given definite supervisory responsibilities in the enrolling of physicians and over the control of medical practice. The workmen's compensation committees were charged with the duty of investigating charges of professional misconduct. The medical societies were also held responsible for the inspection of compensation medical bureaus operated by physicians or by employers and recommending them for licensure by the industrial commissioner. Thus a great share of the responsibility of maintaining proper standards of professional conduct and professional competency was delegated to the medical profession.

Provisions were made for the promulgation by the industrial commissioner of a minimal medical fee schedule and for the arbitration of disputed medical bills, providing a prompt method of adjudication without the necessity or expense of civil court action. Numerous disputes over medical bills had often led to the withdrawal of high-class physicians from this type of work. Arbitration was an ideal measure to prevent this. Self-insurers were given the right, under certain conditions, to set up in their plants medical bureaus where such were deemed necessary for the welfare of employees, but the employees were vouchsafed the right to free choice re-

gardless of this. The determination of disability devolved upon the referees of the Department of Labor, who frequently rendered decisions upon purely medical matters on their own experience and without the necessity of accepting the medical opinion of the medical examiners of the Department of Labor. While the determination of disability or degree of disability and question of causal relationship remain the duty of the referees or the Industrial Board, provisions were made for the appointment of impartial medical experts nominated by the medical societies and for the setting up of medical advisory or appeal boards to examine and render opinions on medical matters. It was urged that all obscure or difficult questions involving medical facts should be decided by physicians and not by lay persons. Medical advisory boards of three or more members were recommended to be nominated by the medical societies and appointed by the industrial commissioner. It was also the recommendation of the Pool Committee that these boards act upon all appeals referred to them by referees or by either litigant on all medical facts, including causal relationship, determination of disability, and the degree of disability. It was recommended that the decisions of these boards be conclusive upon medical facts.

It was also recommended that since the work of the Industrial Board was to some extent concerned with medical problems, at least one of its members

be a physician.

It was finally recommended by the Pool Committee that punishment be provided for rebating and fee-splitting, and for other unethical practices such as solicitation and advertising.

Recommendations were also made for licensing and inspecting compensation medical bureaus and for the control and care of workmen's compensation

cases in municipal, county, and State hospitals. In view of the free choice principle, it was recommended that physicians be required to notify the employer and the department of labor within forty-eight hours of the beginning of treatment, and within twenty days thereafter a more complete report was to be made.

The Pool Committee recommended that all x-ray laboratories should be owned and operated by qualified physicians. Unfortunately, this recommendation was not enacted into law, permitting the intrusion into the workmen's compensation field of lay-owned commercial x-ray laboratories, with results recently exposed by the Moreland Commission.

The recommendation for the appointment of specially qualified physicians to assist the referees and members of the Industrial Board was enacted into law but the services of such experts were infrequently sought by the referees.

The Pool Committee recommended the setting up of one or more medical advisory or appeal boards for the determination of causal relationship and disability. It was to be the function of these boards of experts in the various specialties to hear all appeals from decisions of the referees involving disability or the degree of disability, the determination of causal relationship, and other questions involving medical treatment. Unfortunately, this recommendation was not enacted into law.

It was also recommended that the county medical societies be reimbursed by the Industrial Commissioner for secretarial expenses incurred in registering and enrolling physicians; for investigation of charges filed against physicians under the new Act; for the inspection of medical burcaus; for the activities of the arbitration bureau; and for the medical advisory and appeal boards set up by the county medical societies in each district, and for other duties necessitated by the Act. Unfortunately, no provisions were ever made for an appropriation to cover these expenditures on the part of the societies, and even in the original appropriation no funds were made available for the inauguration of the provisions of the 1935 Law. In spite of this, the societies carried on at their own expense and largely through the voluntary aid of their members.

It is to be noted here that it was the opinion of the Pool Committee that the duties of the county medical societies in regard to the new Act were confined to the "investigation of charges filed against physicians" and not to the assumption of complete police control over the profession, as has recently

been implied. The amendments to Section 13 of the Workmen's Compensation Law were enacted into law in the spring of 1935 and became effective on July 1, 1935. It was incumbent on the State Medical Society, through its Committee on Workmen's Compensation, to organize the sixty-one county medical societies of the State to carry out the functions of the amended law, to qualify and code all of the physicians who desired to be placed on the panel to treat Methods and standards of compensation cases. qualification had to be devised; workmen's compensation committees were appointed in all of the counties and were instructed in their functions and duties. Application forms had to be devised and printed and distributed. The physicians of the State had to be informed of the provisions of the new Law, of the method of reporting cases, of the limitation on professional services in accordance with their qualifications as general practitioners or specialists. Special qualifying advisory boards had to be set up to meet the rush of thousands of applicants who desired to

practice under the new Law. Your State Committee had to meet with the representatives of insurance carriers, employers' organizations, self-insured employers, and representatives of the Industrial Commissioner, to devise a fee schedule as provided by the new Law, and at the same time as all of the above functions had to be devised and carried out. Indeed, it can be shown that the medical societies were alert and responsive to their duties and responsibilities even long before machinery was set up by the industrial commission of the Department of Labor and before the Governor appointed the new Industrial Council on which five physicians sat to function as advisers to the Commissioner of Labor.

It may be interesting to note that although the fee schedule for the metropolitan area was formulated as late as May, 1936, over a year after the passage of the new Law, and nearly ten months after its going into effect, the efforts of the State Committee to effect its promulgation for the entire State did not actually bear fruit until May, 1938 (two years later). The actual efforts of your Committee to bring about a uniform schedule for the entire State are outlined in a report to the Hous? of Delegates on May 5, 1938, by the Chairman of the new Council Committee on Workmen's Compensation, Dr. Frederic E. Elliott.

To indicate further the alertness of your State Society, during this entire period, though overburdened by the many responsibilities incumbent on the State and county compensation committees, your representatives served as advisers to the industrial commissioner and the Industrial Council in drawing up rules and regulations for medical practice, physician's medical bureaus, employer's medical bureaus, x-ray and clinical laboratories, for arbitration of medical bills, for settlement of disputes on innumerable matters concerning the relationship between the profession and its members, between physicians and insurance carriers and employers, and finally in obtaining or attempting to obtain opinions through the Labor Commissioner, from the Attorney General regarding many moot legal points.

Your Committee was amicus curiae in the case of Szold vs. Outlet Embroidery Outlet Supply Company, Inc., as a result of which the constitutionality of the Workmen's Compensation Law and the delegation of authority to the medical societies was upheld in the Supreme Court and affirmed unanimously

by the Court of Appeals.

One of the chief functions of the Workmen's Compensation Committee of the Medical Society of the State of New York and its Bureau of Workmen's Compensation is to act as liaison between the Department of Labor, insurance carriers, employers, and other interested parties and to coordinate the functions of the sixty-one county medical society compensation committees of the State. Much of our success in fulfilling our obligations under the amended Workmen's Compensation Law of 1935 was due to this coordination and to the uniformity with which the county societies functioned in interpreting the law and the rules and regulations of the Department of Labor and in administering their duties. This coordination was achieved through personal contacts, the issuing of bulletins on important matters (since 1935, fifty-seven state-wide bulletins were issued by the Bureau and some were published in the JOURNAL), by appearances at meetings of local and district branches of county medical societies, and by constant contact with workmen's compensation boards and physicians personally and through correspondence. By these means, some de-

gree of uniformity was achieved, and in spite of the ambiguities and redundancies in the statute a fairly smooth functioning of the agencies set up by the State and county medical societies resulted.

The Workmen's Compensation Committee and its Bureau rendered an annual report to the House of Delegates which was replete with information and detailed discussions of all aspects of the Workmen's Compensation Law involving the medical profession and its various relationships.

Through the above methods the Bureau served as a point of contact of the medical profession for the Department of Labor and its various subsidiary agencies, the more than seventy insurance carriers of the State, self-insured organizations, Compensation Insurance Rating Board, and individual employers and labor unions and other interested persons and agencies. The thousands of letters received annually from county medical societies, physicians, and other persons attest to the value of the bureau as representating the medical profession in the administration of the Workmen's Compensation Law. In particular, the Department of Labor, through the Industrial Commissioner, the Deputy Industrial Commissioners, the Industrial Council, the heads of the Workmen's Compensation Division, the Industrial Board, and the Compensation Medical Registrar have been in constant touch with our Bureau throughout the past nine years, which helped us to fulfill our obligations and attain whatever success it was possible to achieve through such close cooperation. It is perhaps more exact to state that the Society, through its Bureau, sought close cooperation not only to bring about the implementation of the newly amended Section 13 but to clear up the redundancies and ambiguities which inevitably result when a law is amended. A perusal of our Annual Reports to the House of Delegates since 1935 will indicate the interest which the State Society took in the amended law in order to facilitate its administration in the interest of the injured work-

In estimating and summing up, the role played by the Medical Society Compensation Bureau, the county medical society Committees on Workmen's Compensation, the numerous responsibilities devolving upon the compensation committees should be enumerated, even if only in outline. These included the setting up of a minimum fee schedule which is conceded to be a model of such schedules throughout the country, although by no means perfect; the setting up of standards for the qualification of physicians and the registration and enrollment of nearly 20,000 physicians throughout the State, the setting up of standards and application forms for the licensing of physicians' and employers' medical bureaus; the inspection of said bureaus and the recommendation of same to the Industrial Com-missioner for licensure; the periodic reinspection of such bureaus; cooperation with the Compensation Insurance Rating Board, with the Department of Labor, and with the American Arbitration Association in the setting up of the arbitration procedure and the arbitration of medical bills throughout the State; the continued association with the Industrial Commissioner and Industrial Council in the development of rules and regulations to implement the amended Law in 1935 and the continued assistance and cooperation with this State agency up to the present time. In addition to each county medical society, the State Bureau served as a public relations bureau in all matters affecting the medical profession and in particular the relationships between physicians, and with insurance carriers and employers and the Department of Labor and the public. These latter functions, though not susceptible to complete delineation, are of the utmost importance in the administration of the Workmen's Compensation Law so far as the medical profession is concerned.

so far as the medical profession is concerned.

An understanding of these numerous functions and responsibilities which were undertaken by the medical societies voluntarily and without the appropriation of funds, as originally recommended by Dr. Pool's committee to the Legislature in 1933, are an indication of the vital interest of the medical profession in fulfilling their obligations to the public. The Annual Reports of the Bureau will bear out our contention that the interest of the Medical Society in the proper administration of the Workmen's Compensation Law was altruistic and idealistic and not based upon any selfish or materialistic motives. That the organized medical profession was able to enlist the services of so many busy physicians in this vital undertaking in fulfilling their obligations, as well as they have been fulfilled, to the end that the workers of this State are obtaining the highest quality of medical care, should be a source of great satisfaction to the profession and an indication that responsibility may be placed upon the medical profession with confidence.

We believe it is not too much to assert that no other interested parties to the Workmen's Compensation Law, not even the Labor Department, has made a greater contribution to the public welfare than the medical profession through its agencies. Progress in workmen's compensation administration is evolutionary rather than revolutionary. laws are enacted, even if wisely drawn, they must be properly administered by the agency of government responsible for their enforcement. Unless the statutes are drawn carefully and after due thought, they may defeat the purpose for which they are intended. No little confusion has been created and maladministration fostered by ambiguities and redundancies in the original amendments enacted in The medical societies were not unaware of this confusion and frequently sought by all means to obtain amendments to the Law to clarify and simplify the statutes so that they could be more ef-fectively administered and so that the medical societies and medical profession could more effectively carry out their responsibilities. Unfortunately, despite the recommendations of the medical societies, few, if any, amendments of the Law to improve its administration have been enacted since 1935. Annually and again this year we have recommended numerous amendments designed to improve the situation and to control whatever evils and abuses may still exist.

We believe that most of the major evils and abuses which the 1935 amendment was designed to correct have been abated to a great extent, but as we again point out this year, and more particularly since the disclosures of the Moreland Act Commission, there are still situations that require remedial legislation. Along these lines we are appending herewith a report made to the Council by the Committee on Workmen's Compensation which included a number of amendments which in our opinion will help to achieve the desired goal. We wish to emphasize that the basic principles of the 1935 amendments to Section 13 were sound although, unfortunately, in practice, because of factors over which the medical society had little control, the operation of certain phases of the Law has not been flawless.

It cannot be gainsaid that the injured workers

have at their disposal the best qualified practitioners and specialists in the State, as nearly 20,000 physicians have been enrolled by our county medical society committees since 1935. We are bold to state that certain recommendations which were made by the Pool Commission in 1933 and which were not enacted into law would have served in a large measure to control unethical practices recently unearthed by the Moreland Commission, aided by Judge William F. Bleakley and Mr. H. T. Stichman. The proposal that commercial laboratories be banned, although included in the original draft of the bill in 1935, was, through the activity of certain commercial interests, defeated and the way left open for commercialism in compensation practice. Proper medical care and ethical professional conduct cannot flourish in an atmosphere of commercialism. are again urging that laymen and lay-owned x-ray laboratories have no place in medical practice. It is illegal for a corporation to practice medicine and there is no reason why lay-controlled or lay-owned agencies should be permitted to operate in workmen's compensation practice. We must strongly resist all efforts on the part of these sinister groups to intrude themselves into medical practice and contaminate the medical profession.

We must also see to it that the functions of the Department of Labor and its subsidiary departments and the workmen's compensation boards of the medical society are exactly defined to the end that the compensation boards may be enabled to fulfill their function in regard to the discipline of incompetent and unethical practitioners. We must again urge that the Department of Labor be completely reorganized to the end that from the head to the lowest paid employee all shall be embued with a proper understanding of the Workmen's Compensation Law, not only in a legalistic sense but from the point of social responsibility to the injured workers and the public. The Industrial Commissioner and the Industrial Council, the referees, and the medical examiners of the Department of Labor are largely responsible for the way in which the primary purposes of the Law are carried out. There has not poses of the Law are carried out. always been that degree of cooperation with the medical profession on the part of past commissioners of the Department of Labor necessary to achieve the cooperation of the physicians in this State in fulfilling their obligations to the injured workers. Such cooperation is a sine qua non if claimants are to be properly treated and their claims to compensation promptly and equitably adjusted. So, too, the cooperation of employers and insurance carriers with the medical profession is essential to achieve a smooth administration of the law. In the past, insurance carriers, including the State Insurance Fund, have not had the courage or the vision to cooperate with the medical profession in bringing to light evidence of wrongdoing on the part of certain unethical physicians against whom there has been suspicion, although on innumerable occasions they were invited by the medical societies to submit evidence, which they had in their possession, of improper medical conduct. The arbitration procedure was a check upon the payment of improper medical bills, but it cannot be gainsaid that the bills of a number of physicians under suspicion, against whom the carriers and employers "grumbled," were frequently sattled without being reviewed at arhifrequently settled without being reviewed at arbitration. By this means evidence or at least suspicion of improper medical practice might have been dis-closed. There might have been cumulative evidence piled up as a result of the frequent submission of bills

to arbitration of certain practitioners instead of the

settlement of such bills by carriers.

The aid and support of the carriers involved would have enabled the medical societies to take action

and remedy the situation.

Our Workmen's Compensation Bureau has repeatedly recommended the separation of the claims and medical departments of insurance carriers. This same recommendation has been made by other investigating bodies but has not, up to the present time, been adopted by the insurance carriers. This is in the interest of the injured worker and would schieve a more harmonious relationship between the medical profession and the carriers and employ-The petty irritations which result from contact between the lay personnel of insurance carriers and practicing physicians do not make for proper and harmonious relationships, and occasionally redound to the disadvantage of the injured workers. Furthermore, the insurance carriers, self-insurers, and other employers should employ properly qualified physicians and consultants to check up on patients under treatment rather than to commit this important function to physicians occasionally not qualified for the important function they serve. It would seem that from the standpoint of self-interest the insurance carriers would realize that the highest quality of medical personnel would in the long run serve their interests better than the employment of less fully qualified examiners.

Your Council Committee on Workmen's Compensation during the past year reported periodically on matters involving Workmen's Compensation

On June 11, 1943, the Committee rendered an opinion on the right of lay technicians to serve in hospitals as interpreters of x-ray films in the absence of qualified roentgenologists. This position was substantiated by an opinion of the Department of Labor to the effect that only a legally licensed physician qualified in roentgenology could serve in this capacity

Senate Introductory 785 was enacted into law, providing for the treatment of compensation cases in public hospitals where an employer or insurance carrier refuses or neglects to give authorization for hospitalization. The bill was signed by the Gover-

On June 11, 1943, your Committee reported to the Council that Attorney General Nathaniel L. Goldstein had rendered an opinion on May 4, 1943, that the Medical Society Compensation Boards were authorized under the Civil Practice Act, Sections 406 and 358, to subpoena witnesses and to render the oath to witnesses. The same opinion indicated that such authorization is not contained in Section 13-d of the Workman's Compensation Law itself. On the basis of this decision, the medical societies have pro-teeded with the investigations and hearings of physicians charged with violations of Section 13-d of the Workmen's Compensation Law.

The Committee submitted a brief to the Chairman of the Industrial Board protesting a decision of said Board granting 4½ cents on mileage fees under Section 120 of the Workmen's Compensation Law. It was the opinion of the Committee that Section 13-f-2 of the Workmen's Compensation Law should apply, as it worked a great hardship to a physician to drive a long distance to a hearing, spend half a day or all day at the hearing, and then obtain a fee of \$10 plus a mileage fee of 41/2 cents, or, in the case of a specialist ist, a fee of \$25 plus a mileage fee of 41/2 cents. The Industrial Commissioner eventually instructed the

referees that although the mileage fee could not be changed it would be possible for the referee to give consideration to granting a physician a fee in excess of \$10 or \$25 to adequately compensate the physician for the time spent in appearing at the hearing. This

is now the practice.

The Committee protested a decision of the Industrial Board upheld by the Attorney General in 1936 to the effect that unauthorized physicians under the Workmen's Compensation Law would be permitted to participate in examinations before the Department of Labor or to render testimony. The original opinion held that only physicians who treated pa-tients might be authorized by the Industrial Com-missioner. The brief submitted was based on the definition of the practice of medicine as contained in Section 1250 of the Education Law (which indicates that all physicians examining or treating patients are engaging in the practice of medicine) and, therefore, should also be authorized and qualified by the Industrial Commissioner, if they are to be permitted not only to treat patients but to examine compensation claimants and to give testimony. Our protest was necessitated by the fact that a certain physician whose license to practice under the Workmen's Compensation Law had been suspended was acting as an examiner of patients at the Department of Labor. No opinion from the Attorney General on this question has been received.

On September 3, 1944, the Committee rendered an opinion as to the right of an intern or resident employed by a hospital, not licensed in the private practice of medicine, to be authorized to treat compensation claimants coming to the hospital and not assigned to a member of the attending staff of said hospital. It was the opinion of the Committee that such resident or intern, though licensed to practice but not engaged in the private practice of medicine and having an office within the State, was not entitled to be qualified and authorized to treat compensation claimants. A duly constituted physician of the hospital staff should be assigned to treat all compensation cases in hospitals as the physicians of record, even though emergency treatment was given

by an intern or resident.

The Bureau received from the Industrial Commission, after some delay, a list of all employers' medical bureaus in the State for submission to the local county compensation boards for check-up examinations of the bureaus to determine whether they are adequately equipped and provided with medical personnel. This inspection has gone forward in practically all counties of the State.

In accordance with the resolution passed at the last meeting of the House of Delegates, the Chairman of the Industrial Board of the Department of Labor was notified that legislation should be enacted to cover salaried medical personnel in hospitals so that they may be covered for injuries received in the

course of their employment.

A questionnaire letter was sent to all physicians qualified as roentgenologists in this State with the approval of the Council and the President, requesting information on the cost of conducting their of-This questionnaire has been taken very seriously by members of the specialty and the Bureau has compiled adequate statistics to justify the rates charged under the minimum workmen's compensa-tion fee schedule. Indeed, it seems that our request for an increase in the rates is fully justified as a result of the information obtained.

On October 8, 1943, your Committee informed the Council that the various county medical societies were presently engaged in hearing physicians charged by the Moreland Act Commissioners with violations of Section 13 of the Workmen's Compensation Law. Your Director aided in the setting up of these investigations and numerous conferences were held with the Chairman and members of the Workmen's Compensation Committees of the metropolitan area and with the Deputy Industrial Commissioners as well as with the presidents of the various county medical societies.

On December 3, 1943, your Committee recommended that Governor Dewey be called upon to appoint a commission similar to that which was appointed by Governor Lehman in 1933 to study the medical aspects of the Workmen's Compensation Law as they apply to the Amended Law and that appointments be made to said committee from nominations made by the President of the Medical Society of the State of New York. It would be the function of this commission to take into consideration the recommendations of the Moreland Act Commissioners and those made by the Medical Society and by the Department of Labor in an effort to improve the administration of the Workmen's Compensation Law and abate evils and abuses that still exist under the law.

Your Committee was invited to confer with members of the New York State Federation of Labor concerning amendments to the Workmen's Compensation Law contemplated by the Department of Labor. A number of such meetings were held and an agreement was reached on various matters.

Your Committee strongly recommended to the Council that commercial laboratories be banned from the examination of injured workers under the Workmen's Compensation Law. The Committee further called for the adoption and introduction into law of the resolution adopted by the House of Delegates in May, 1943, which called for enactment of Section 1264 and 1265 of the Education Law, making feesplitting, rebating, etc., grounds for revocation or suspension of the general medical license.

On October 29, 1943, at the request of the Acting Industrial Commissioner, we sent a notice to all physicians in the State asking them to apply for dispensation to treat compensation claimants of colleagues in the armed forces so as to permit or divide the fee with them in an equitable manner. It was then decided by the Commissioner that no such dispensation would be necessary, as the Commissioner had changed his views and deemed it proper for a physician to take over the practice of a colleague in the services, render his own bill for treatment, and collect a fee without dispensation. Any proper arrangements between the parties as to the division of the fee would not be considered a violation of Section 13-d of the Workmen's Compensation Law.

It was announced that the Compensation Insurance Rating Board had notified all insurance carriers to the effect that payment will be made for surgical assistance in all hospitals where interns are not available for private and compensation cases except where the fee schedule specifically includes the assistant's fee in the operative fee (hernias).

assistant's fee in the operative fee (hermas). It was announced on February 5, 1944, that the Director of the Bureau was invited to represent the Committee on Workmen's Compensation at the legislative meetings called by the Industrial Commissioner to discuss proposed amendments to the Workmen's Compensation Law to be introduced in the 1944 session of the Legislature. At this time, your Director, on behalf of the Committee and of the Council, submitted the recommendations which

the Workmen's Compensation Committee proposed to the Council and which were adopted at its January meeting. Your Director was requested by the President of the Medical Society, Dr. Thomas A. McGoldrick, to cooperate with the Industrial Commissioner in accordance with the following request received on January 12, 1944:

January 12, 1944

Dr. Thomas A. McGoldrick, President New York State Medical Society 294 Clinton Avenue Brooklyn, N. Y.

Dear Dr. McGoldrick:

You are, undoubtedly, aware of the criticism leveled at the Department of Labor by the Moreland Commissioners investigating the administration of workmen's compensation, because of the type and condition of facilities available in which to make proper and adequate medical examinations.

In the past, the Labor Department has relied upon the local authorities to provide accommodations in which to conduct hearings and physical examinations outside of the cities of New York, Albany, Syracuse, Rochester, and Buffalo; but I am anxious to improve the conditions complained of, and would appreciate the advice and assistance of the State and local county medical societies.

It occurred to me that you might be willing to request the various county societies to appoint committees to look into the matter of adequate hearing and examining facilities in their particular localities, and favor me with a report.

In the hope that this suggestion will receive your favorable consideration, I am attaching hereto a memorandum containing what I believe to be the minimum medical examining facilities that should be available at hearing points away from the office. If you agree that these minimum standards are reasonable, I should like you to submit them to the various county medical societies as a guide. I am also attaching a list of the counties in which compensation hearings are held, and the location of the facilities now available to us.

It is my hope that the committees appointed by the various county societies would visit these places to see if they meet the minimum standards, or can be improved to do so; and also that they would investigate the possibility of obtaining more adequate space and facilities to perform this function in their respective vicinities.

I think I should also inform you that the Moreland Commissioners have suggested the possibility of conducting hearings and physical examinations in hospitals. I should like the local committees to explore this possibility and comment upon it in their reports.

There are certain things which are important for the local committees to keep in mind. Specifically, they are:

1. That the place of examination must be reasonably near the hearing room, so that the injured workers may go from the point of hearing to be examined and return to the hearing room, and the doctor will be available to make his findings known to the referee on the day of the hearing.

the hearing.

That the point of hearing and the examining room be reasonably accessible by ordinary means of transports.

tion to the workers in the area.

3. That facilities be available in which to examine females to care for the increasing number of women who are

injured while working.

I am also listing the names and addresses of the Assistant Industrial Commissioners in charge of the various upstate districts, and think it would be an aid to the local county committees if you would convey this information to

them.

The committees may wish to visit the locations on a day
when hearings and examinations are being held. If so, such
information, and any other information desired by the committees will be furnished by the Assistant Commissioner upon

I sincerely hope that the medical societies in the State will agree to assist in this matter.

Very truly yours.
MICHAEL J. MURPHY
Deputy Industrial Commissioner

#### Standard Medical Examining Facilities at Hearing Points Away from the Office

- A. What the doctors should have
  - 1. White cost
  - 2. Stethoscope
  - Blood pressure gage
  - 4. Percussion hammer

#### B. Room

- 1. Should be at least 100 feet square
- 3. Proper light, ventilation, and heat
- Should be painted
- 5. Should contain electric plugs
- 6. Accessible
- Anteroom for dressing and undressing
- & Toilet facilities

#### C. Equipment

- 1. Examining table with pad
- Paper sheets
   Washable pillow
- 4. Screen
- At least four good chairs
- 6. Shadow box
- Running hot and cold water and towels
- 8. A female attendant should be available at all times.

It can be stated that the county medical societies are busily engaged in cooperating with the Industrial Commissioner in this matter.

On January 6, 1944, your Committee submitted to the Council a complete report embodying numerous recommendations for amendments to the Workmen's Compensation Law. These are herewith submitted in full as they were adopted by the Council of the Medical Society of the State of New York:

#### Excerpt from Minutes of Meeting of the Council, January 13, 1944]

On motions duly seconded and carried, the Council approved the following recommendations for presentation by President McGoldrick to the Moreland Act Commission:

1. The appointment of highly qualified experienced physicians in the various specialties on a part-time basis to act as medical examiners singly or in boards in all controverted cases, to determine questions of causal relationship, degree of disability, and the necessity of further treatment or of a particular type of treatment.

That each medical examination area of the State be provided with ample and sanitary space and a sufficient number of examiners to make a complete and thorough examina-

tion of every claimant.

ŕ

That all claim representatives and all physicians other than the medical examiners of the State Department should be barred from the medical examining rooms of the Department of Labor when medical examinations are in progress.

4. (Third Party Actions) That in order to insure treatment to an injured worker during the pendency of a "third party action" Section 13(c) be amended in keeping with Section 29. The amendment to 13(c) would delete the phrase "unless and until notice of lastice." election to sue or the bringing of suit against such third party."

5. That Section 13-a(3) should be amended to provide a penalty against a physician who is responsible for an improper transfer of a patient from one physician to himself.

That the Law be so amended as to entitle the employer or carrier only to a "consultation representative" at major examinations to protect his interest, but the major procedure should be performed by the patient's own physician or specialist unless the patient waives this right.

That Section 13-j(1) be amended to read "except that it might employ medical inspectors to examine compensation cases periodically in accordance with the provisions

of Section 13-a(4)."

S. That Section 13-a(5) be amended to read that no request for authorization shall be withheld by an employer or carrier unless said employer or carrier has had a medical examination of the claimant in accordance with Section 13-a(4) and has provided the attending physician with the medical facts on which it bases its withholding of authorization.

- That under circumstances where the carrier disputes the doctor's bill (in excess of \$25 for medical or surgical consultation or operations or physiotherapeutic procedures), or refuses to pay it, the matter shall be referred to the Industrial Board for consideration of the issues or to an arbitration committee in accordance with Section 13-g.
- That an employer who maintains a medical bureau without a Department of Labor license should be deemed guilty of a misdemeanor; and Section 13-j(2) should be amended to this effect. (See also Recommendation 21.)
- That Section 24 should be amended to read: "Claims for services or treatment rendered or supplies furnished pursuant to subdivision (b) (out-of-state cases and noninsured employers) shall not be enforceable unless approved by the Industrial Board."
- That the first paragraph of Section 13-d shall be amended to read: "The medical society or board that has recommended the authorization of physicians to render medical care under this chapter shall investigate, hear, and determine all charges of professional or other misconduct by any authorized physician as herein provided, under rules and pro-cedures to be prescribed by the Industrial Council of the Department of Labor and shall report the evidence of such misconduct. with their determination thereon, to the Commissioner. Such medical society or board shall be vested with the right to sub-poena witnesses and records, to issue sub-poena duces tecum, and to administer the oath to all witnesses required in the investigation, hearing, or trial of any physician under this chapter. Such investigation, hearing, or trial shall be conducted by the medical society or board in which the accused physician maintains his principal office or by the board which originally recommended the authorization and qualification of the physician. If the accused physician has removed his office to another county within the State, jurisdiction shall lie with the county in which the physician then practices." practices."
- That Section 13-d 2 should also be amended to provide in Section 13-d 2(c) that the sub-

were presently engaged in hearing physicians charged by the Moreland Act Commissioners with violations of Section 13 of the Workmen's Compensation Law. Your Director aided in the setting up of these investigations and numerous conferences were held with the Chairman and members of the Workmen's Compensation Committees of the metropolitan area and with the Deputy Industrial Commissioners as well as with the presidents of the various county medical societies.

On December 3, 1943, your Committee recommended that Governor Dewey be called upon to appoint a commission similar to that which was appointed by Governor Lehman in 1933 to study the medical aspects of the Workmen's Compensation Law as they apply to the Amended Law and that appointments be made to said committee from nominations made by the President of the Medical Society of the State of New York. It would be the function of this commission to take into consideration the recommendations of the Moreland Act Commissioners and those made by the Medical Society and by the Department of Labor in an effort to improve the administration of the Workmen's Compensation Law and abate evils and abuses that still exist under the law.

Your Committee was invited to confer with members of the New York State Federation of Labor concerning amendments to the Workmen's Compensation Law contemplated by the Department of Labor. A number of such meetings were held and an agreement was reached on various matters.

Your Committee strongly recommended to the Council that commercial laboratories be banned from the examination of injured workers under the Workmen's Compensation Law. The Committee further called for the adoption and introduction into law of the resolution adopted by the House of Delegates in May, 1943, which called for enactment of Section 1264 and 1265 of the Education Law, making feesplitting, rebating, etc., grounds for revocation or suspension of the general medical license.

On October 29, 1943, at the request of the Acting

On October 29, 1943, at the request of the Acting Industrial Commissioner, we sent a notice to all physicians in the State asking them to apply for dispensation to treat compensation claimants of coleagues in the armed forces so as to permit or divide the fee with them in an equitable manner. It was then decided by the Commissioner that no such dispensation would be necessary, as the Commissioner had changed his views and deemed it proper for a physician to take over the practice of a colleague in the services, render his own bill for treatment, and collect a fee without dispensation. Any proper arrangements between the parties as to the division of the fee would not be considered a violation of Section 13-d of the Workmen's Compensation Law.

It was announced that the Compensation Insurance Rating Board had notified all insurance carriers to the effect that payment will be made for surgical assistance in all hospitals where interns are not available for private and compensation cases except where the fee schedule specifically includes the assistant's fee in the operative fee (hernias).

It was announced on February 5, 1944, that the Director of the Bureau was invited to represent the Committee on Workmen's Compensation at the legislative meetings called by the Industrial Commissioner to discuss proposed amendments to the Workmen's Compensation Law to be introduced in the 1944 session of the Legislature. At this time, your Director, on behalf of the Committee and of the Council, submitted the recommendations which

the Workmen's Compensation Committee proposed to the Council and which were adopted at its January meeting. Your Director was requested by the President of the Medical Society, Dr. Thomas A. McGoldrick, to cooperate with the Industrial Commissioner in accordance with the following request received on January 12, 1944:

January 12, 1944

مريم المنظم المنافع ال

Dr. Thomas A. McGoldrick, President New York State Medical Society 294 Clinton Avenus Brooklyn, N. Y.

Dear Dr. McGoldrick:

You are, undoubtedly, aware of the criticism leveled at the Department of Labor by the Moreland Commissioners investigating the administration of workmen's compensation, because of the type and condition of facilities available in which to make proper and adequate medical examinations.

In the past, the Labor Department has relied upon the local authorities to provide accommodations in which to conduct hearings and physical examinations outside of the cities of New York, Albany, Syracuse, Rochester, and Buffalo; but I am anxious to improve the conditions complained of, and would appreciate the advice and assistance of the State and local county medical societies.

It occurred to me that you might be willing to request the various county societies to appoint committees to look into the matter of adequate hearing and examining facilities in their particular localities, and favor me with a report.

In the hope that this suggestion will receive your favorable consideration, I am attaching hereto a memorandum containing what I believe to be the minimum medical examining facilities that should be available at hearing points away from the office. If you agree that these minimum standards are reasonable, I should like you to submit them to the various county medical societies as a guide. I am also attaching a list of the counties in which compensation hearings are held, and the location of the facilities now available to us.

It is my hope that the committees appointed by the various county societies would visit these places to see if they meet the minimum standards, or can be improved to do so; and also that they would investigate the possibility of obtaining more adequate space and facilities to perform this function in their respective vicinities.

I think I should also inform you that the Moreland Commissioners have suggested the possibility of conducting hearings and physical examinations in hospitals. I should like the local committees to explore this possibility and comment upon it in their reports.

There are certain things which are important for the local committees to keep in mind. Specifically, they are:

- 1. That the place of examination must be reasonably near the hearing room, so that the injured workers may go from the point of hearing to be examined and return to the hearing room, and the doctor will be available to make his findings known to the referee on the day of the hearing.
- the hearing.

  2. That the point of hearing and the examining room be reasonably accessible by ordinary means of transportation to the workers in the area.
- tion to the workers in the area.

  3. That facilities be available in which to examine females to care for the increasing number of women who are injured while working.

I am also listing the names and addresses of the Assistant Industrial Commissioners in charge of the various upstate districts, and think it would be an aid to the local county committees if you would convey this information to

The committees may wish to visit the locations on a day when hearings and examinations are being held. It so, such information, and any other information desired by the committees will be furnished by the Assistant Commissioner upon

request.

I sincerely hope that the medical societies in the State will agree to assist in this matter.

Very truly yours,
MICHAEL J. MURPHY
Deputy Industrial Commissioner

r:.

(n)

=:

of the Committee on Workmen's Compensation as a whole was adopted as amended.

Your Committee is still of the opinion that the best interests of the public and of the medical profession require close and constant attention by the State Society to matters involving the medical care of injured workers through a strong and well-implemented Bureau of Workmen's Compensation. Our reasons in detail have been given in previous reports and need not be repeated at this time in the light of the experiences of the past year.

Arbitrations.—During the year 1943, 66 arbitration sessions were held in the metropolitan area and 5 in other parts of the State; 609 cases were arbitrated in the metropolitan area, 35 upstate. In a total of 644 bills, arbitrated awards were given in all but 42. The amount in dispute in the metropolitan area was \$60,605.23 and the awards totaled \$36,428.81. This includes the cases in which no awards were made. In the upstate area the amount in dispute was \$3,345.50 and the amount awarded \$2,435.50. In 347 cases, bills scheduled for arbitration were settled at the time of arbitration without the necessity of a hearing.

Total Physicians Qualified.—To date 20,690 physicians have been qualified and recommended for authorization by the county medical societies' Compensation Boards. The number qualified in each county follows:

Albany, 305; Allegany, 43; Bronx, 2,129; Broome, 223; Cattaraugus, 84; Cayuga, 71; Chautauqua, 116; Chemung, 102; Chenango, 41; Clinton, 49; Columbia, 42; Cortland, 43; Delaware, 53; Dutchess, 160; Erie, 1,046; Essex, 36; Franklin, 67; Fulton, 69; Genesee, 54; Greene, 45; Herkimer, 62; Jefferson, 109; Kings, 3,742; Lewis, 24; Livingston. 56; Madison, 41; Monroe, 565; Montgomery, 64; New York, 5,537; Nassau, 550; Niagara, 179; Oneida, 240; Onondaga, 429; Ontario, 104; Orange, 170; Orleans, 29; Oswego, 77; Otsego, 67; Putnam, 16; Queens, 1,365; Richmond, 140; Rensselser, 137; Rockland, 103; Saratoga, 70; Schenectady, 121; Schoharie, 30; Schuyler, 15; Seneca, 27; Steuben 92; Suffolk, 202; Sullivan, 71; St. Lawrence, 94; Troga, 41; Tompkins, 72; Ulster, 114; Warren, 60; Washington, 51; Wayne, 68; Westchester, 906; Wyoming, 45; and Yates, 27.

The Committee wishes to express its deep appreciation for the loyalty and efficiency of the office staff during the past year. They have worked realously without regard to time limitation in carrying out their duties to the Society during a period when it was often impossible to obtain needed additional clerical assistance. For this the Committee and the Director are deeply grateful and bespeak the approbation of the Society.

#### PART X

## Medical Licensure

In accord with your action of last year there was set up a "Council Committee on Medical Licensure" replacing the Subcommittee on Status of Foreign Physicians, with the same personnel:

F. Leslie Sullivan, M.D., Chairman Scotia Howard Fox, M.D. New York David A. Haller, M.D. Rochester The Committee presents the following report.

#### REPORT

Medical Licensure statistics recently completed for the year 1943 for the State of New York are not

encouraging. There have been effected through collaboration in the State Department certain Rules and Regulations to be discussed later in this report which will in the near future decrease the tremendous number of foreign physicians licensed in the State of New York and stem the tide of influx from other states and countries.

Let us review briefly the 1942 statistics. "In the United States, District of Columbia, and Possessions, in 1942 there were 8,557 licenses issued. 201 less than in 1941 (8,758). In the State of New York, 1,330 licenses were issued as against 1,173 in 1941, or an increase of 157; in California, an increase of 110—740 against 630; in Illinois 72 fewer licenses, 509 in 1942 as against 581 in 1941; Pennsylvania decreased 23—516 as compared with 539." (Last year in the compiling of our statistics, for the purpose of comparison, as you may remember, your Committee used these four states because they annually license more than 500 candidates.)

"New York State, which last year licensed oneseventh of the total number licensed in the United States, District of Columbia, and Possessions, now has reached the all-time high of licensing onesixth of the total. In 1941 this State Licensed 439 foreign physicians; this year the Department licensed 698 with foreign credentials and only 632 graduates of approved schools."

At Buffalo, on May 4, 1942, the House of Delegates of the Medical Society of the State of New York, after a study of the report of your Committee, passed the following resolutions:

"1. We recommend that the House of Delegates of the Medical Society of the State of New York urge the Board of Regents of the State of New York to refuse, in the future, to admit to examination for licensure any graduate of a foreign medical school, 25 or more per cent of whose graduates taking the examination during the past ten years have failed to pass. This percentage is to be based on the average of the results of the individual years.

"2. That the House of Delegates of the Medical Society of the State of New York urge the Board of Regents of the State of New York to limit definitely to three in all the number of examinations that may be taken by any candidate for licensure to practice medicine. Your Committee feels that if a candidate cannot pass these examinations after three attempts, it clearly indicates a medical education of a very inferior quality, and one against which the people of New York State should be adequately protected."

Let us look at the reasons for these recommendations:

First, the New York State Department of Education is now unable to obtain any biographic data or verification of credentials of candidates through foreign schools. Their rule is to accept for candidates any men graduated before the invasion of Austria. We are still generous in this interpretation of the rules. Of the graduates of foreign medical faculties examined in ten years the percentage of failures has ranged from 40.1 per cent to 70.5 per cent. Last year 61.9 per cent from foreign schools failed the New York State Medical Licensing Examination. There are many schools whose graduates habitually fail, but are still permitted to take the examination; and

Second, having once been admitted to examina-

mission of a fraudulent report shall constitute a misdemeanor.

That consideration be given to the inclusion 14. in Section 13-d 2(c) of a clause making the participation in a division, transference, assignment, rebating, splitting, or refunding

of a fee, a misdemeanor. (Payment of Bills) That the following amendment shall be made to Section 13-g:

> "Unless within thirty days after a bill has been rendered to the employer by the physician or hospital which has treated an injured employee such employer shall have notified the Commissioner and such physician or hospital in writing that such employer demands an impartial examination of the fairness of the amount claimed by such physician or hospital for his or its services, the right to such an impartial examination shall be deemed to be waived and the amount claimed by such physician or hospital shall be deemed to be the fair value of the services rendered by him or it, and the Board may make an award to such physician or hospital in the amount claimed by such physician or hospital. A default in the payment of such award may be enforced in the manner provided for the enforcement of compensation awards as set

forth in Section 26 of this chapter.
"The Board may make an award to the physician or hospital for his or its services in accordance with the decision of the arbitration committee as evidenced by a copy of said decision certified by at least three of the members of the arbitration committee and a default in the payment of such award may be enforced in the manner provided for the en-forcement of compensation awards as set forth in Section 26 of this chapter."

(It was understood that the Council was approving a single amendment to cover two situations: (1) A situation in which a carrier does not object to a bill within thirty days after its submission and therefore is not entitled to arbitration; (2) A case that has gone to arbitration but for which the award is not enforced.)

That cognizance be taken of a recent Supreme Court decision holding an employer or carrier liable if he provides medical care, appliances, apparatus, trusses, etc., to an injured employee prior to a hearing before the Department of Labor; and that the giving of such authorization and the consequent providing of medical care or apparatus shall not be construed as evidence of liability on the part of the employer.

(Education Law) That Sections 1264 and 1265 of the Education Law be amended to bring them into harmony with the standards of the Workmen's Compensation Act, Section 13-d(e), which reads: "has participated in the division, transference, assignment, rebating, splitting, or refunding of a fee for medical care under this chapter."

It was understood that the Council was of the opinion that there can be no differentiation between compensation practice and private practice. All patients should be treated alike, and all infractions of the rules of professional conduct and ethics should be

similarly dealt with under the Education La and the Workmen's Compensation Law.)

(Provision for Investigation Through Stat Wide Department) That provision be man for employment by the Department of I al of an adequate staff of investigators heade by a deputy commissioner who is an attoney, to investigate complaints relative to the Workmen's Compensation Law as it applie to physicians, insurance carriers, employer commercial houses dealing in medical sur plies and apparatus, and commercial labor tories of all kinds, if the latter are permitte to operate. This Department of Investiga tion should be state-wide.

(Laboratories) That Section 13-b(3) relatin to laboratories permitted to operate unde the Workmen's Compensation Law should be amended by restoring the word "owned"—to read: "shall be owned, operated, and supervised by qualified physicians."

20. That, if this prohibition against commercia laboratories cannot be included in the Law no laboratory be permitted to operate with out a license under Section 13-c; that they be required to adhere to the principles of Section 13-d(e) and of Section 13-e of the chapter regarding the granting and revoking of licenses. It should be a misdemeanor for any laboratory to provide service under the Workmen's Compensation Law without a license, and the amended law should contain a provision to the effect that no charge for their services if unlicensed, or by anyone employed therein, shall be valid and enforceable under the Workmen's Compensation Law.

(Medical Bureaus) That amendment be made to Section 13-j(2) as follows: "An employer who operates a medical bureau without a license shall be deemed guilty of a misdemeanor and the physician employed in such bureau shall be subject to the provisions of Section 13-d." (See also Recommendation 10).

That provision should be included in the 22. Workmen's Compensation Law and the Labor Law to make the participation of a lay person with a physician in fee splitting, rebating, etc., a misdemeanor punishable by fine or imprisonment.

That it might be advisable for the Depart-23. ment of Labor to make a ruling prohibiting the settlement of medical bills without arbitration, unless approved by the Workmen's. Compensation Board of the county medical society.

The Council considered a suggestion from the Committee that "provision should be made in the regulations of the Department of Labor requiring insurance carriers to notify physicians promptly a if a case is to be controverted as to compensability, so as to enable physicians to determine their that we have a six of the protection of the Workman's status vis-a-vis the patient in re the Workmen's Compensation Law.

On motion duly seconded and carried, this was approved in principle, subject to rephrasing by Dr. Kaliski, and it was understood that in rephrasing it there would be included provision for proper payment for medical care for those injured workers who do not go off duty.

On motion duly seconded and carried, the report 🔄

their lives in defense of our nation surely merit good obstetric and pediatric care. This "shotgun" type of help is not democratic as we understand it. Let the government make the funds available to the patient and give the patient the privilege of being an individual who chooses and makes her own arrangements with her chosen physician. This will maintain a good quality of obstetric and pediatric care. If we insist on direct aid, if that is what is needed, to the patient, without any strings attached, we will set a precedent for extension of government business into private practice.

Last, we shall not commit our doctors overseas and elsewhere to a system of government medicine to come home to, in which they had no voice and

which was not here when they went away.

Recommendations Re Resolutions.—Your Committee, as well as officers of the Society, met in consultation with Dr. Robert Hannon, Secretary of the Board of Medical Examiners at Albany, New York, on October 21, 1943.

A second meeting was held in New York City with the Committee on Licenses of the Board of Re-

gents.

Present were Regt. Roland B. Woodward; Regt. Gordon K. Bell; J. Hillis Miller, Associate Commissioner of Education; Irwin A. Conroe, Assistant Commissioner for Professional Education; Dr. Thomas A. McGoldrick, President of the Medical Society of the State of New York; Dr. Peter Irving, Secretary; Dr. Joseph S. Lawrence, Executive Officer; and Dr. F. Leslie Sullivan, Chairman of Medical Licensure.

A summary of the discussions of both meetings will be given. The Committee referred to herein will mean the Committee on Licenses, and the Society will mean the Medical Society of the State of New York,

Dr. McGoldrick stated clearly the position of the Medical Society of the State of New York, viz.—

"1. We believe that the high medical standards of medical schools of the State of New York

should be maintained;

"2. That, as stated in Section 1256 of the State Education Law, Handbook 9, page 58, New York medical schools and New York medical students shall not be discriminated against by the registration of any school out of the state whose minimum graduation standard is less than that fixed by the status for New York medical schools."

Because of the purported discrimination against New York State medical students and graduates thereof, the House of Delegates has requested certain rules, regulations, and changes in the State Law.

## Resolution No. 1-Failures:

We recommend that the House of Delegates of the Medical Society of the State of New York urge the Board of Regents of the State of New York to refuse, in the future, to admit to examination for licensure any graduate of a foreign medical school, 25 or more per cent of whose graduates taking the examination during the past ten years have failed to pass. This percentage is to be based on the average of the results of the individual years.

Regent Woodward felt that a request of this type was arbitrary only and that it would have no legal standing. He felt that because 25 per cent had failed it did not mean therefore that the other

75 per cent were poor doctors. It was also brought to his attention that necessarily the reverse would not be true, that is, that they would be good doctors. The figures of statistics of high percentage of failures of candidates of foreign faculties as an average was brought to the attention of the committee. That the figure of 25 per cent failures as an average was in reality below the actual figure, which ranged from 31 per cent to 100 per cent as an average for all foreign medical faculties, was pointed out.

It was stated by the Committee that many foreign medical faculties were not recognized. It was called to the attention of the Committee by the Society that in 1942 candidates of 104 out of 154 foreign medical faculties were admitted to examination.

It was pointed out that to recognize these schools the only data that could be available at present concerning candidates from belligerent countries were from credentials presented by the candidates themselves and from information obtained before the

The Society could perceive why there might be a legal issue in refusing admission to the examination of candidates of foreign medical faculties graduating before 1938 when other candidates from the same classes of the same schools had been recognized. However, we did not see how proper inspection of schools could be mantained once the war had started. We were informed that great discretion was used and that all credentials, such as passbooks, statements from registrars of schools, original diplomas and not photostats were studied very carefully.

The Committee decided that graduates from foreign schools who had matriculated in January, 1940, or after, will not be admitted to examination in New York State unless equivalent standards have been determined by an inspector or agent of the Department of Education of the State of New York, and that extraordinary discretion will be used concerning graduates of foreign medical schools of the classes of 1938 and 1939, inclusive. The ruling can be put into effect as of that date, since discussions were started at that time and such a date would

not be retroactive.

#### Resolution No. 2-Number of Examinations:

That the House of Delegates of the Medical Society of the State of New York urge the Board of Regents of the State of New York to limit definitely to three in all the number of examinations that may be taken by any candidate for licensure to practice medicine. Your Committee feels that if a candidate cannot pass these examinations after three attempts, it clearly indicates a medical education of very inferior quality, and one against which the people of the State of New York should be adequately protected.

The Committee also felt that to allow three failures only was arbitrary or open to legal question, but felt that if a candidate had three failures it did show he needed more preparation. The Committee agreed to frame a regulation stating that after three failures the candidate must return for study in the subjects in which he failed before he could take the examinations again. There was no mention of how many times he might retake them after that except to assure that the same process could be repeated.

The question needing clarification is this, viz.—
"A candidate failing in more than one subject in either group, shall be re-examined in the entire

tions, there is no end to the number of times they

may take them.

In Handbook 9 of the Regulations of the University of the State of New York, in the paragraph under "Licensing Examination, Special Requirements," it provides, \* "A candidate may be conditioned in one subject of each group, and may remove these conditions at any other subsequent examination. Any candidate who has written three examinations, except examinations for removal of conditions, and who after the third examination has failures in at least two subjects in either group, shall not be eligible for re-examination for a period of one year." [Note: The asterisk refers to the footnote: "This paragraph has been suspended for the duration of the war."]

In New York State in 1942 there were 562 previous failures licensed out of a total of 813 before all Boards in the United States. Of these 562 let us look at the failures of licentiates from foreign schools:

One hundred and forty-seyen were licensed after one failure in this State, two from elsewhere.

Two hundred and seventy-three were licensed after two or more failures before our Board, two from elsewhere, and

Forty-two here and elsewhere.

Therefore, out of 562 previous failures licensed. 446 were from foreign schools, 33 per cent had failed in New York once previously, and 70-plus per cent had been licensed after two or more failures.

In the computation of United States statistics 60 licentiates had failed five or more times. 13 had five failures before obtaining a license, 19 had six, 10 failed seven examinations, 5 individuals failed eight tests, one failed nine, 2 failed ten, 3 failed eleven, 2 failed twelve, and 2 failed thirteen examinations before being successful. Three graduates of European medical schools were licensed after eighteen, twenty, and twenty-one failures, respectively, in Connecticut, New York, and New Jersey. The majority of these physicians with multiple failures were Massachusetts and New York examinees. Thirteen states licensed in 1942 only physicians who had never failed a state board examination, while New York licensed 562 who had previously failed. With the exception of California, Illinois, Maine, Massachusetts, New Jersey, New York, and Pennsylvania, no state licensed more than 9 such candidates.

The greatest number examined by any one state was 1,263 in New York, of whom 670 passed and 593 (47.05 per cent) failed. No other state examined more than 65 such candidates. Fewer than 5 were more than 65 such candidates. Fewer than 5 were tested by thirteen states and Hawaii. The per-centage of failures of graduates of seventy-seven of the schools was more than 25 per cent. gether, 11,227 graduates of faculties of medicine abroad were examined, of whom 5,991 passed and 42.6 per cent failed. The greatest number, 2,088, was examined in 1940, when 54.7 per cent failed. The number licensed in twelve years increased

from 92 in 1930 to 948 in 1940. In 1942, 58 fewer than in 1940 were registered. The highest percentage of failures occurred in 1941, 59.2 per cent. At no time during this thirteen-year period did fewer than 30.7 per cent fail.

Schools with 25 Per Cent or More Failures in 1942.—Of 154 foreign faculties, 102 were represented in variable figures before licensing boards in the United States in 1942. Eighty faculties and licensing bodies had failures of from 25 to 100 per

cent of the physicians examined. These figures apply only to those examined on the basis of credentials obtained in countries other than the United States and Canada. From 1937 to 1941, of a total of 154 faculties, 145 were represented, with failures, of 108 schools of 25 per cent or more.

The bulk of examinees, 1937-1941, inclusive, came from Germany, with Italy running a distant second. For instance, from twenty-seven faculties represented from Germany, the University of Berlin had 741 in 1937–1941; 852 candidates in all—111 last year, with 49.5 per cent failures; the University of Vienna has had 2,136 candidates—397 last year, 47.3 per cent failures. A few examples from Italy: University of Naples, 1937-1941—209, with 62 per cent failures; University of Rome-335, with 51 per cent failures.

We shall omit discussion of chiropractic licensure and Basic Science Laws in this article because there have been special committees appointed for this particular study and they will no doubt render a re-

port on these matters.

Other Conditions Affecting Our Individual Status. -As pointed out last spring, there have been advances into the ranks of organized medicine by the State and federal governments through changes, some of which Medicine originated, and through many others which we neglected to dispute. Now, unless Organized Medicine, through the American Medical Association and its component state societies, takes the offensive to retain individual rights and private initiative in medicine, it will continue to undergo this insidious revolution, with the result that when the war is over there will be very little semblance left of our original privilege and we will be

completely governmentalized.

Let the Committee give you some thoughts, which will indirectly affect medical licensure:

The acceleration of medical courses as a war emergency is a necessary thing. The fact that the Army and Navy control such programs through the Manpower Commission is significant. The collegiate training programs now being formulated by the Army and Navy also provide for an acceleration of premedical education which may present licensure problems in the future, and legislation may be necessary in order that a physician who has had less than two years of premedical training or less than four courses of eight months each in an approved, registered, or recognized school may be licensed.

A new phase of this is now being considered. The Navy wishes to dispense with qualifying certificates for V-12s in New York State Medical Schools, a requirement which has been in force for over forty

years.
2. The United States Cadet Nurse Corps. These

points are significant:

Acceptance by hospitals and nursing organizations of this federal program.

Being on the federal payroll; and, last, as

quoted from their pamphlet, "At War's end, students in training ninety days prior to the end of hostilities may complete their training at government expense."

Will it stop there?

3. Obstetric and Pediatric Care for Wives and Children of Enlisted Men.—Through increased use of Social Security Act and State Agencies are we to forsake doctor-patient relationships and do business with a third party—the government?
The wives and children of men who have offered

increasing the amounts which they are paying for

their present insurance.

While the policy contract will continue to exclude liability on account of "cosmetic" plastic surgery, the extra premium charged for adding protection on account of that specialty to the policy has been reduced from 50 per cent to 10

(d) The policy contract will also continue to exclude liability on account of x-ray therapy, but the surcharge for including protection for that specialty has been reduced from \$30 to \$15 for minimum limits. Thus, the premium for a minimum policy including x-ray, after April 1, will be

reduced from \$62 to \$45.

(e) In July, 1942, a reduction of 50 per cent was made in insurance rates for members going into service with the armed forces. This was done to encourage service members to retain protection on account of the acts of the doctors left in charge of their civilian practices and also to provide protection for their own professional acts while in the armed services, the need for which had been pointed out by the Judge Advocate General of the Army. Effective April 1, a further reduction to 30 per cent will be made for those members, bringing the cost for a minimum policy down to \$9. At the same time, a provision is being added to those policies limiting liability to suits or claims filed within the continental limits of the United States. This limitation is necessary as neither the Society nor the Yorkshire Indemnity Company have facilities for defending members outside the continental limits of the United States.

(f) Liability for claims arising solely by reason of a doctor's participation in a formal copartnership in the practice of medicine is a business and not a professional liability, and for that reason it has always been excluded in the policy contract. However, since protection is now granted without charge for the acts of an insured medical assistant, it is believed that protection on account of an insured copartner can be included without bur-dening the loss costs of the Group Plan as a whole. Accordingly, policies dated on or after April 1 will include liability on account of the acts of an insured copartner, and the special copartnership policy now required to cover that liability will be

discontinued.

2. In working out the details of the foregoing changes, the Committee was assisted by the Society's Insurance Representative, Colonel Harry F. Wanvig, who returned from a seven months' tour of duty in North Africa on August 1, in time to help bring the negotiations to a satisfactory conclusion. Colonel Wanvig has now returned to North Africa for another short tour of duty at Allied Force Headquarters but, as before, he is keeping in constant contact by air mail and cable with the details of operation of the Group Plan which are being carried on under the competent care of Mr. Gordon P. Casper and Miss Mary G. Flood, both of whom have been associated with the management of the Group Plan from its inception in 1921.

3. Each year the Committee invites attention to the number of malpractice actions brought against uninsured members during the preceding year, and warns that similar suits will arise in the year ahead. In spite of that repeated warning, each year brings a full quota of suits and claims against uninsured members. Based on previous experience, it is correct to state that 12 per cent of the members who will have suits and claims filed against them in 1944

will be uninsured and will have to face the problem of disposing of those actions without the protection of insurance. A policy purchased after a claim has been filed is, of course, not retroactive; therefore, the Committee again recommends that uninsured members give urgent consideration to securing protection in the Group Malpractice Insurance Plan without delay.

The Committee desires to quote the following from its 1941 report because the need for keeping this viewpoint constantly before the members is as important today as it was when published two years

ago:

"As in previous years, it is noted that loose, unwarranted, and frequently thoughtless criticism by fellow members of their confreres continues to be the largest single inspiration for malpractice actions. This is a phase of medical practice which can and should be vigorously attacked in every community. It offers the most effective and perhaps the only way in which unfounded and unjust claims can be discouraged. Medical men are called upon to advise their patients on many matters affecting their welfare. Where that welfare or well-being involves poor results of treatments by other physicians, members should use the greatest care in determining whether those results flowed from negligence or mere errors in judgment or the inevitable complications of life, disease, or injury. It is precisely at that moment that the doctor can perform the greatest service to his patient and to practitioners of medicine as a whole by honest and accurate advice to his patient, making sure that he has all of the facts which entered into and affected the previous treatments."

The Committee feels that special reference should be made to the activities of insurance companies that, from time to time, decide to enter the malpractice insurance business in New York State in competition with the Group Malpractice Insurance Plan. So far these companies have avoided making any proposals to the State Society. No one of them has ever made a constructive offer to the Society or evinced any willingness to underwrite the liability of the members in general. Their method of operation is to select members they believe, for one reason or another, to be preferred risks and to offer them, as individuals, insurance at rates lower than those required by the Group Plan. The effect of this solicitation is to detract support that otherwise would be given to the Group Plan and to create doubt as to its value in the minds of doctors who have had no means of correctly evaluating the offers made to them. No criticism can attach to members who accept those offers because each of them has an unquestioned right to buy his insurance from any insurance company he selects. Nevertheless, it is only fair to those members that they be given an opportunity to know that their encouragement of competing insurance companies could adversely affect the welfare of their fellows in the Society who depend upon the Group Plan for protection. Obviously all of the members will not be classified as "preferred risks" by standards of measurement fixed by insurance companies for the sole purpose of making money. Nor can a member so classified this year be certain that he will be put in the same favored class next year, especially if he has been sued in the meantime. This is precisely why the State Society must maintain a reliable and closely supervised source of protection for all of its members regardless of "classification" and to do so it should have the

group." If this is so then he will have to study the entire group of subjects.

Pursuant to this agreement the Committee submitted to the Society on February 10, 1944, a suggested change in Section 32, Subdivision 2-C, of the Regulations of the Commissioner of Education with respect to the licensing examination for medicine, as quoted below:

"A candidate may be conditioned in one subject of each group and may remove these conditions at any other subsequent examination. Any candidate who has written three examinations, except examinations for the removal of conditions, and who, after the third examination, has failures in at least two subjects in either group, shall not be eligible for re-examination for a period of one year\* from the date of the last examination. Before readmission he shall produce evidence, satisfactory to the Commissioner of Education, of having pursued further study in a medical school or institution acceptable to the department in preparation for such examination. A candidate who has been readmitted to the examination after three failures and submits evidence of satisfactory study of one additional year, and who has failed after writing three additional examinations, or six examinations in all, shall not be eligible for re-examination." (The italicized words are added.)

In order to clarify this ruling, it is the opinion of your Committee that the asterisk and the note con-cerning suspension should be deleted, and that it should also be understood what is meant by an "institution acceptable to the department in prepara-tion for such examination." Otherwise, the change seems reasonable and in keeping with our desire to maintain our medical standards.

Resolution No. 3—Citizenship:

The House recommended that full citizenship be required now for licensure.

The bill is to be framed and submitted to Legislature for change in the law by the State Education Department. The Society was given to understand that no controversial issues would be entertained by the Legislature at this session.

Biennial Registration.—The proposal to register every two years and to pay a four-dollar fee in-stead of a two-dollar fee at registration seems reasonable, in view of the volume of work involved for all professions to be registered. The full directory would be printed in odd-numbered years and a supplement issued in each even-numbered year.

#### Summary

Your Committee feels that progress has been made in clarifying certain licensure requirements.

With the changes in the rulings indicated there will be a gradual, not an abrupt, decrease in the number of candidates of foreign medical faculties admitted to examination.

3. With the change suggested by your Committee on Medical Licensure in Section 32, Subdivision 2-C, there would be a marked decrease in the number of candidates licensed, particularly those of inferior education.

4. Re: Citizenship: The Committee on Licenses

of the Board of Regents was informed of the Recommendation of the House of Delegates. It has given the Board of Regents information as to how the Medical Society of the State of New York stands on the subject and our attitude cannot be referred to as being otherwise.

The Committee on Licenses agrees with our proposal and is drawing up a citizenship bill for sub-

mission to the Legislature.

The Legislative Committee of the Society is likewise prepared to submit a bill or to support the bill of the Department of Education. However, as previously signified, no bill of this nature will be considered at this spring session.

> Respectfully submitted, F. LESLIE SULLIVAN, M.D., Chairman Howard Fox, M.D. DAVID WALLER, M.D.

#### PART XI

## Malpractice Defense and Insurance

The Council Committee on Malpractice Defense and Insurance:

Clarence G. Bandler, M.D., Chairman. New York Peter Irving, M.D., ex officio... New York Kirby Dwight, M.D., ex officio... New York

submitted the following report, which the Council approved.

#### REPORT

A study of the rise and fall of the cost of malpractice protection for members of the Medical Society of the State of New York has led the Committee on Malpractice Defense and Insurance to conclude that high costs are associated with, if not a phenomenon of economic hard times. It is at least certain that the upward trend in these costs which began in 1924 reached its highest point immediately following the low point in the recent depression, while the downward trend which began over a year ago closely follows a return to general prosperity. Other factors, such as the extensive adoption of some new and unsatisfactory professional technic or procedure, might cause a reversal in the present downward trend at any time, but in the absence of such a factor, it would be prudent to anticipate that these costs will certainly climb back to higher levels if any general depression is encountered after the war. In the meantime, the rating machinery of the Group Malpractice Insurance Plan is geared to follow these costs as rapidly as they are confirmed and thus, the Committee is able to announce the following important reductions in insurance costs and other changes which will become effective for all new and renewal policies dated on or after April 1, 1944:

(a) The base premium for a minimum policy of \$5,000/\$15,000 will be reduced from \$32 to \$30.

(b) The percentage table for limits in excess of the minimum is reduced by an average of 10 per cent throughout. Thus, members carrying excess limits will have the benefit of the reduction in the limits will have the benefit of the reduction in the base premium and the percentages charged for higher limits. As in the past, when similar reduc-tions have been made, the Committee points out that after April 1 many members will be able to increase the amount of their insurance without

<sup>\* &</sup>quot;This requirement suspended for duration of war by order of the Commissioner under date of January 7, 1942, which action was ratified and approved by the Regents on January 16, 1942."

#### General Matters

Nominations.—On official request the Council nominated, with alternates, the following, to succeed themselves on expiration of their terms on December 31, 1943: Dr. Moses Keschner of New York, as a member of the Committee on Grievances of the State Department of Education; and Dr. Peter Irving of New York, as a member of the Nurse Advisory Council of the Department of Education.

In accord with previous action of the House of Delegates, the Council nominated to succeed themselves, on expiration of their terms of office as Directors of the Physicians' Home, the following physicians: Dr. W. Travers Gibb, Dr. Peter Irving, Dr. Silas W. Hallock, Dr. Alfred M. Hellman, Dr. Joseph S. Lawrence, Dr. Elies S. L'Esperance, Dr. Harvey B. Matthews, Dr. Seth Milliken, and Dr. Robert Emmet Walsh.

Committee on Office Administration and Policies.—This special committee of the Society has continued with the same personnel: Trustee, Dr. George W. Kosmak, Chairman; General Manager, Dr. Peter Irving; Literary Editor of the JOURNAL, Dr. Laurance D. Redway; Business Manager of the JOURNAL, Mr. Dwight Anderson; Treasurer, Dr. Kirby Dwight. It has met regularly at the same times as the Committee on Publication and therefore participated in the discussions pertaining to affiliated questions dealing with JOURNAL policies and business matters.

The main work of the Committee has concerned clerical salary adjustments. Some of these came up in the ordinary course of events, such as proof by clerks employed on trial of competency for permanent employment; others that were worked out followed individual conferences with the executives that showed that the workers were all experiencing or anticipating difficulties in "making ends meet," in the face of withholding for victory taxes and fed-

eral income taxes.

It was found wise to consult with the auditor, J. K. Lasser and Company, on proper procedure under the stabilization law. With this help, satisfactory readjustments were effected in keeping with that law.

The Committee recommended and the Council authorized the taking out of medical expense insurance in the Medical Expense Fund of New York, Inc., for the personnel of the office, full premiums to be paid by the Medical Society of the State of

New York.

Effect of Redistricting of New York State on the 1944 House of Delegates of the Medical Society of the State of New York.—After the courts in the end of 1943 decided that the law enacted by the 1943 Legislature should stand, in which changes were made here and there in the number of assembly districts, it became obvious that under the Constitution and Bylaws of the Medical Society of the State of New York changes in the number of delegates to the House from several county medical societies would logically be in order, but immediately the question arose as to whether such changes would affect the 1944 House of Delegates. The Council directed the attorney of the Society to look into this situation. This was done, and due attention was given to an opinion rendered by the Attorney General No. 10 opinion rendered b eral, Nathaniel L. Goldstein, on a somewhat similar situation with relation to national party conventions. As a result of these studies, the Council went on record "to the effect that it is the opinion of the Council, based on legal interpretation, that the 1944 House of Delegates will assemble on the old basis of representation." This was made the subject of a memorandum to the secretaries of the component county medical societies under date of December 29,

1943.

Selection of Additional (Twentieth) Delegate to 1944 House of Delegates of the American Medical Association.—At the 1943 meeting of the House of Delegates of the American Medical Association the delegation from the Medical Society of the State of New York was increased from nineteen delegates to twenty. On November 18, 1943, a request was received from the secretary of the American Medical Association for lists of the New York delegation to sit in the 1944 meeting of the House of Delegates of the American Medical Association. The Council, being apprised of this request and being aware that the half of the delegation elected by our 1943 House contained only nine delegates, considered that it should act under Chapter IV, Section 6, of the By-laws, which reads: "The Council shall have power to fill any vacancy which may occur in any elective office not otherwise provided for, until the next meeting of the House of Delegates." This action was deemed wiser than leaving the selection of the tenth delegate to the 1944 House of Delegates of the Medical Society of the State of New York, to be held only a short time before the 1944 meeting of the House of Delegates of the American Medical Association. The Council, therefore, at its meeting on January 13, 1944, filled this vacancy by electing the first alternate, Dr. William Hale, of Utica, to become the new tenth delegate on that half of the delegation.

Communication from the American Medical Women's Association, Inc., Under Date of June 23, 1943.—The Council received and placed on file the following letter from the American Medical Women's

Association, Inc.:

Dr. Peter Irving Medical Society of the State of New York

At the Board Meeting of the American Medical Women's Association held in Chicago June 5-6, 1943, great satisfaction was expressed that commissions and equal recognition of women in the armed forces has finally become an accomplished fact, thus removing the obstacle in the way of women physicians performing the highest patriotic service in their power in this crisis.

This Association, by unanimous vote, authorized me, as the secretary at that time, to express to you our appreciation for the unanimous support given by the House of Delegates of the Medical Society of the State of New York, not once but several times, and for the great privilege of being allowed to present our case in a series of letters published in the State

JOURNAL.

It gives me pleasure to thank you, in behalf of the Association, for this support of our cause.

Yours sincerely, Mabel E. Gardner, M.D.

Belated Bills.—The Council recommends payment of the following bills for expenses in connection with State Society duties which were not turned in until after expiration of the statutory thirty days and possible extension for ninety days more: bill from Dr. J. G. Fred Hiss, in his capacity as a member of a Subcommittee of the Council Committee on Public Health and Education, as a member of the Committee on Convention for the 1943 Annual Meeting, as a lecturer in the postgraduate courses and at the annual Secretaries' Conference, bills for travel expenses and miscellaneous covering the period from July, 1942, through the Annual Meeting in May, 1943, totaling \$198.50; bill from Dr. Emily D. Barringer covering railroad fare to Atlantic City to attend the A.M.A. House of Delegates as a New York State Delegate, June, 1942, in the amount of \$9.00.

unwavering support of every member who requires

malpractice insurance.

772

The Group Insurance Plan was conceived and organized by the State Society to meet the pressing needs of its members at a time, twenty-three years ago, when the insurance companies, upon whom they had relied for their protection, were either retiring from the business or raising their rates to prohibitive levels because of the heavy losses they had sustained. This group method of solving a difficult problem was unique because never before had an insurer and an assured pooled their separate facilities for their mutual assistance; and time has abundantly demonstrated that this is the only method by which malpractice insurance can be successfully conducted in this State. Since malpractice defense, which is an unquestioned function of the State Society, is one of the principal parts of the Group Insurance Plan, the latter became and, of necessity, has remained a function of the State Society, no part of which could be delegated to the county societies. The right to malpractice defense by the Legal Counsel of the State Society and the right to insurance in the Group Malpractice Insurance Plan are inherent in membership in the State Society, and the right of an individual, as such, to buy his insurance from any company he selects is inherent in the individual and no action by a component county society can add to or detract from those rights. Therefore, any attempt on the part of a county society to further the interests of a competing insurance company by publishing in its bulletin as advertising matter or as editorial comment, the approval or recommendation of such a company by the county society or one of its official committees, can only be regarded as an attempt to draw away from the support of the State Society's Group Plan members who might otherwise prefer to retain their insurance in it. This is direct competition tending to nullify an important, necessary, and well-established activity of the State Society upon which a large majority of the members must rely for protec-

tion. Not only is independent and competing action by a component insupportable in any federation, but, in the case of malpractice insurance in New York State, such an activity on the part of a county society would be tantamount to advocating a return to the chaotic conditions which forced the organiza-

tion of the Group Plan originally.

The Committee would be remiss if it did not express its appreciation for the splendid cooperation it has had from Mr. A. O. Robinson, the managing vice-president of the Yorkshire Indemnity Company, and his staff. These gentlemen have not only met every requirement of the Society and its insurance representative but have labored diligently to understand the problems of the Society to the end that they may make themselves and their company more useful to the members. The Committee feels that the Society is fortunate in having men of their character and ability associated with it in the operation of the Group Malpractice Insurance Plan.

#### PART XII

## War Participation

The Council transmits the following report of its Committee on War Participation, which has the following personnel:

Louis H. Bauer, M.D., Chairman. Norman S. Moore, M.D	Hempstead
James F. Rooney, M.D Henry W. Cave, M.D	Albany
Samuel J. Kopetzky, M.D	

#### REPORT

The War Participation Committee has had a large amount of routine work carried on chiefly by the Secretary's office. This has pertained largely to obtaining physicians for induction centers throughout the State.

Requests are received from the Second Service Command, are cleared with county societies, and, in the case of State hospitals, with the hospitals concerned, and report is made back to the Second

Service Command.

Up to the present the following numbers of physicians have been recommended to the various induction boards: Albany, 10; Binghamton, 6; Buffalo, 9; Rochester, 13; Syracuse, 17; Utica, 4; New York City (Grand Central Palace), 150; total, 209.

At the present rate of requests about fifty to one hundred more will be recommended by April 1. Nine physicians were not recommended because they were not considered available by their local institu-

tions or societies.

With the call shortly after the last Society meeting for 6,000 additional physicians from all over the United States your Committee recommended to the National Procurement and Assignment Service that all physicians previously physically disqualified be reassessed as to their present availability. county societies were asked to reassess the present availability of these men.

It was also suggested to the National Procurement and Assignment Service that the use of alien physicians might well be made in giving medical

care to prisoners of war.

The Chairman of National Procurement and Assignment replied that the first of these recommendations was being carried out and that the other had been taken up with the Surgeon General of the Army.

The number of physicians from New York State who have gone into the services is at least 9,300, as

well as can be ascertained.

The majority of physicians entering the Service in the future will be from the recently graduated group.

The State Procurement and Assignment Committee has relocated one hundred and thirty-seven physicians in New York State, besides furnishing several replacements in industrial medical setups.

It is recommended that county societies make plans for re-establishing discharged physicians in their former practices and for giving physicians who have not previously been in practice necessary postgraduate instruction and placing them in areas where they are needed. The latter will call for the cooperation of the State Medical Society and the American Medical Association Planning Committee. It is recommended that the War Participation Committee be designated as the coordinating agency in this program.

The House last year called for a survey of alien physicians and an effort was made to determine how many of them would be willing to return to their former homes in connection with the rehabilitation This was discussed with the Committee on Medical Licensure but no feasible way has been found to make this survey, as there is no list of such

physicians.

serves as a collecting agency for physicians of the Society without cost to the physicians; the Bureau coordinates Workmen's Compensation in relation to the component county socie-"The Director of the Bureau attends all ar-

bitrations throughout the State.

"The Director has been instrumental in obtaining uniform fee schedules for the entire State against the active opposition of in-

surance companies and employers.
"The result of this has been an excess of over \$1,000,000 a year for upstate physicians,

"Whereas, the multifarious duties of this Bureau, and the obligation recently imposed for

investigation; and
"Whereas, it is contrary to the best interests
of the State Society, and the component medical
societies, to have such onerous duties discharged

by a part-time director; be it
"Resolved, that the Director of the Bureau of
Workmen's Compensation shall be a member of the Medical Society of the State of New York on a full-time basis and, when appointed, in no way engaged in private medical practice; be it further "Resolved, that the Medical Society shall ap-

point such full-time director on a contract basis for a minimum period of five (5) years; be it

further

"Resolved, that the Board of Trustees determine the annual remuneration to such individual in keeping with the responsibility of the position and the administrative capacity of the individual. It is suggested that a remuneration of \$15,000 a year is adequate and would meet the present living conditions.

The Council at its September, 1943, meeting followed this instruction, selecting Dr. David J. Kalisk as full-time Director of the Workmen's Compensation Bureau of the State Medical Society and sent his property of the State Medical Society and sent his prop his name to the Board of Trustees for arrangement of

The Board of Trustees in October, 1943, submitted a contract to Dr. Kaliski, which he held under consideration until December, 1943, when he declined it. Since that time the matter has been under further consideration by the Board of Trustees, who will make a supplementary report thereon to the

Medical Relief, Direct Payment of Medical Fees (Section 59).—The House adopted the following resolution:

Be it resolved that the House of Delegates of the Medical Society of the State of New York go on record as favoring such change in the Federal Social Security Law as is necessary that will permit direct payment to the physician, and further recommends that the delegates to the A.M.A. be instructed to introduce a resolution requesting the A.M.A. to memorialize the proper authorities for such changes that are necessary in the Federal

Social Security Law to allow direct payment to the physician.

A resolution embracing this stand was presented to the 1943 A.M.A. House of Delegates but was defeated.

Basic Science Law (Section 61).-The House recommended that the question of a Basic Science Law in New York State be referred to the new subcommittee of the Committee on Legislation for study; and that they should consult with the committee of the State Legislature on the chiropractic (See Report of Committee on Legislation, problem. Part VIII.)

Amendment to Workmen's Compensation Law to Cover Paid Hospital Physicians (Section 70) .-The House referred the following to the Council Committee on Workmen's Compensation for consideration:

"WHEREAS, physicians under salary employed by hospitals or other institutions allied to the practice of medicine are exposed to certain special hazards incident to their employment, in addition to the ordinary hazards common to all individuals

employed by these institutions; and "Whereas, such physicians (with the exception of interns) are not included as beneficiaries under the Workmen's Compensation Law; and

"Whereas, disability resulting from injury or illness sustained as a result and in the course of such employment may markedly diminish or entirely dissipate the earning power of such physicians; be it hereby

"Resolved, that the Medical Society of the State of New York initiate measures, through appropriate channels, to cause the Workmen's Compensation Law to be so amended as to provide for the inclusion of the class of physicians above described as beneficiaries under that Law."

The Director of the State Society Workmen's Compensation Bureau advised the Chairman of the Industrial Board of the Department of Labor that legislation be enacted covering salaried medical personnel of hospitals under the provisions of the Workmen's Compensation Law, and an answer was received advising him that this communication had been referred to the Commissioner of Labor.

U. S. Cabinet Secretary of Health (Section 71)-The House adopted the following resolution:

"Whereas, the forward march of civilization depends on the world's health; and

"WHEREAS, the health of the people of the United States is the concern of all the people; and

"Whereas, coordination of all agencies working for the maintenance of health and the prevention and cure of disease is becoming increasingly important in our daily lives; and "WHEREAS, the problems of medical care could

best be coordinated and correlated under the

guidance of a central agency; be it

"Resolved, that the American Medical Association urge with all the power at its command that a cabinet Secretary of Health be established, at the head of which there shall be a physician, a member of a county medical society.'

The following abbreviated resolution was introduced in the 1943 House of Delegates of the

A.M.A. and adopted:

"WHEREAS, coordination of all agencies working for the maintenance of health and the pre-

# Résume of Instructions of the 1943 House of Delegates and Actions Thereon of Council, Trustees, and Officers

There follows a summary (of "index" type) of the different instructions issued by the House at its meeting on May 3 and 4, 1943. The significant portions alone of the different resolutions are quoted.

The term "section" with a number following each heading refers to the minutes of the 1948 House published in the June 15 and July 1, 1943, issues of the New York State Journal of Medicine.

In each instance the action on the instruction is indicated.

School Health (Section 51).—The House adopted the Reference Committee's report containing the following paragraph:

"Your reference committee further recommends that in every community where physicians are appointed by school authorities to examine school and high school students that the county society invite the proper authorities to select the appointees from panels of physicians submitted by the county society."

Attention of the county societies was called to this in the Report of Proceedings of the Council distributed in August, 1943.

Publication of Directory in 1944 (Section 52).—The House approved nonpublication of the Medical Directory of New York, New Jersey, and Connecticut in 1943 but felt "that if conditions at all warrant publication of a 1944 Directory, this should be undertaken, and, furthermore, that all physicians in the military services should have an adequate listing of their contributions to the armed forces of the nation. Such a new Directory would be a sustainer of morale and would also be of much practical value."

The Publication Committee gave extended and detailed attention to the possibility of publication of a 1944 Directory with special attention to a supplement. The Council postponed publication of Directory or supplement on account of practical difficulties and probable unsatisfactory results.

Moreland Act Investigation (Section 56).—The House adopted the following resolution:

"Whereas, charges made against certain physicians in connection with the Moreland Act Investigation of the medical aspects of the Workmen's Compensation Law, if subsequently substantiated and proved by trial, would convict these physicians of acts which are clearly unethical; and

cians of acts which are clearly unethical; and
"Whereas, the prominent notice given these
charges in the press may have led a portion of the
public to infer that such actions are condoned or
tolerated by the profession; therefore be it

"Resolved, by the House of Delegates of the Medical Society of the State of New York that all unethical activities in connection with the provision of medical service under the Workmen's Compensation Law are hereby unreservedly conditions and be it further."

demned and repudiated; and be it further "Resolved, that the Medical Society of the State of New York urges its component county societies to take prompt and uncompromising action to the full extent of their disciplinary powers whenever a member is proved to be guilty of the alleged unethical practice."

The Council sent a special memorandum on this matter to the county societies on September 9, 1943.

Amendment to Medical Practice Act (Section 57).—The House adopted a resolution for amendment to the Medical Practice Act, Section 1264, "Revocation of certificates; annulment of registrations."

"2. The license or registration of a practitioner of medicine may be revoked, suspended, or annulled or such practitioner reprimanded or disciplined in accordance with the provisions and procedure of this article upon decision after due hearing in any of the following cases: (a) fraud and deceit, (b) conviction of crime or misdemeanor, (c) addict or drunkard, (d) untrue advertising and secret remedies, and (e) abortion," and this is the suggested new matter:

"(f) Any physician participating in the division, transference, assignment, rebating, splitting, or refunding of his fee for medical care."

"Recommendation: Approved with the recommendation that the resolution be referred to the Committee on Legislation, who shall determine, after conference with the Counsel of the State Society, any changes in the wording of the suggested amendment which will not conflict with the spirit of the amendment. The Legislative Committee shall determine the opportune time for introducing the legislation."

The Committee on Legislation still has this under consideration as to the "opportune time."

Appointment of Full-Time Director of Workmen's Compensation Bureau of State Medical Society (Section 58).

"WHEREAS, the amendment to the Workmen's Compensation Law in 1935 delegated specific functions to the Medical Society of the State of New York; and

"WHEREAS, it has been alleged through the public press that certain physicians have participated in practices contrary to the ethical principles of the Society; and

"WHEREAS, it is mandatory upon the Medical Society of the State of New York to investigate

and try such alleged conditions; and
"Whereas, there has been set up a Director of
the Bureau of Workmen's Compensation activities by the Medical Society of the State of New
York in conjunction with the component societies;

"Whereas, this Bureau embraces all activities, duties, and responsibilities under the amendment to the Workmen's Compensation Law of 1935:

"These duties and activities include qualifications of physicians, licensing of x-ray laboratories, and medical bureaus operated by physicians and employees; they include hearings and trials and charges of violations of any of the provisions of the law, as well as investigation and follow-up of complaints; the Bureau

Delegates; would enafile county societies having legislative problems to bring them in advance of the meeting of the Legislature to the attention of the other counties and of the State Committee; would enable the State Committee to inform county committees of the prospects of the forthcoming Legislative Session, and, in general, would prepare the county committees for more effective cooperation with the State Committee in its work; therefore, be it

"Resolved, that this House of Delegates advise the Council that it favors the holding of such an additional legislative conference with the chairmen of county society legislative committees shortly before the opening of the regular session of the State Legislature, for the purposes enumerated above, and to the end that the coordinated legislative activities of the county and State societies may be more purposeful and effective than they can be under present procedures."

With approval of the Council, an extra conference of County Legislative Chairmen was held, on the same day as the conference of County Society Secretaries-December 7, 1943.

County Health Units (Section 82) .- The House suggested that the Council Committee on Public Health and Education take up the matter of full-time county public health units "for further study and appropriate action when trained personnel for the establishment of such units becomes available."

This matter was referred to the Council Commit-

tee on Public Health and Education.

Workmen's Compensation Law (Section 84).-The House recommended reference to the Committee on Legislation of consideration of present inadequacies of the Workmen's Compensation Law, and the "addition of such amendments as will strengthen it." (See Council Report, Part IX.)

Status of Foreign Physicians (Section 86).— The House adopted the following recommendations:

"1. We recommend that the House of Delegates of the Medical Society of the State of New York urge the Board of Regents of the State of New York to refuse, in the future, to admit to examination for licensure any graduate of a foreign medical school, 25 or more per cent of whose graduates taking the examination during the past ten years have failed to pass. This percentage is to be based on the average of the results of the individual years.

That the House of Delegates of the Medical Society of the State of New York urge the Board of Regents of the State of New York to limit definitely to three in all the number of examinations that may be taken by any candidate . for licensure to practice medicine. Your committee feels that if a candidate cannot pass these examinations after three attempts, it clearly indicates a medical education of a very inferior quality, and one against which the people of

New York State should be adequately protected.
"3. We recommend the appointment of a continuing committee by the President to be known as the 'Committee on Medical Licensure,' whose duties shall be to compile, study, and assay such pertinent data as may be of assistance to the Board of Regents to the end that the people of the State of New York be guaranteed physicians of the highest quality on whom they can rely with full

confidence."

The Council directed that the present Committee To Study Present and Future Status of Foreign Physicians be renamed "Committee on Medical Licensure." (See Council Report, Part X.)

Blood and Plasma Exchange Bank (Section 91).--The House adopted the following resolution:

"Resolved, that the Medical Society of the State of New York sponsor the extension of the activities of blood and plasma exchange banks throughout the State, with the view toward assisting and encouraging blood and plasma exchange banks to extend to the sick throughout the State, and even to our remotest communities, the benefits they

are now rendering; and further be it "Resolved, that the Medical Society of the State of New York refer this matter to a Council Committee or a Special Committee on Blood Transfusion to accomplish these aims."

The Council authorized the President to appoint a subcommittee of the Committee on Public Health and Education, to be known as the "Subcommittee on Blood and Plasma Exchange Banks." It was understood that this subcommittee would consist of three members, with two ex officio members, in addition, from government agencies. (See Council Report, Part IV.)

> Respectfully submitted, PETER ITVING, M.D., Secretary

## Report of the Counsel

To the House of Delegates; Gentlemen:

Your Counsel herewith submits his report of the activities of the Legal Department of the Medical Society of the State of New York for the period from February 1, 1943, up to and including January 31,

Your present Counsel did not take office until April 19, 1943, but this report covers, in addition to his own activities, the period of two and a half months during which time his predecessor, the late Lorenz J. Brosnan, was serving as counsel to your Society. Society. His many years of service to your Society were terminated by his sad and untimely death on April 12 1000 by his sad and untimely death of April 12 1000 by his sad and untimely death of April 12 1000 by his sad and untimely death of April 12 1000 by his sad and untimely death of April 12 1000 by his sad and untimely death of April 12 1000 by his sad and untimely death of the same April 13, 1943, following a brief period of acute illness, and on April 19, 1943, your Counsel was then appointed in his place and stead.

Mr. Brosnan had served as General Counsel for the Medical Society of the State of New York for a period of over thirteen years. During his tenure of office he had the respect, affection, and cooperation of all with whom he came in contact. His death came as a shock and as a deep personal loss to his many friends among the medical and legal professions and to his associates in the practice of law.

Your present Counsel has been identified with the work of your Society since 1928 and, hence, has been for years fully familiar with every phase of the activities of the office of General Counsel, and during the tenure of office of his predecessors, Lorenz J. Brosnan vention and cure of disease is becoming increasingly important in our daily lives; and

"WHEREAS, the problems of medical care could best be coordinated and correlated under the guidance of a central agency; be it

"Resolved, that the American Medical Association urge with all the power at its command that a Federal Department of Health be created; to be headed by a Secretary of Health who shall be a properly qualified Doctor of Medicine who is a member of a county medical society.'

World Food Conference (Section 72).—Our House adopted the following resolution:

"WHEREAS, the use of food and the study and application of problems of nutrition are increasingly essential in the training and practice of the doctor; and

"WHEREAS, the problems of food in this country, as well as the world at large, are the concern of the medical profession; and "WHEREAS, the knowledge and experience in the possession of the medical profession in this country is of the utmost value in the discussion of national as well as international food relationships; be it

"Resolved, that the American Medical Association be urged to request representation at the coming United Nations' Food Conference to be held at Hot Springs, Virginia, on May 18, 1943.

The New York Delegation to the A.M.A. House considered that since the Food Conference had been long under way, there was no need to introduce a resolution to the A.M.A.

Foreign Physicians Survey (Section 75).—The House adopted a reference committee recommendation that the War Participation Committee of the State Society conduct a survey of alien physicians who would be willing to return to continental Europe for relief work. (See Report of War Participation Committee, Part XII.)

Full Citizenship as Requirement for License to Practice (Section 78).—The House recommended full citizenship be required now for licensure in New York State.

This was referred by the Council to its Committee

(See that report.) on Legislation.

Amendment of Federal Workmen's Compensation Act (Section 79).—The House adopted the following resolution:

"Whereas, employees working as longshoremen and harbor workers are covered against injury or death resulting from accidents while at work by the Federal Compensation Act (Public-No. 803-69 Congress) known as 'Longshoremen's and Harbor Workers' Compensation Act'; and

"WHEREAS, the employer of such workmen is obligated to furnish such medical, surgical, and other attendance or treatment, nurse and hospital service, medicine, crutches, and apparatus for such period as the nature of the injury or the process of

recovery may require; and "WHEREAS, physicians in the neighborhood of docks and harbors where such injury may occur have given such injured employees emergency treatment and have had the patient taken away from them by the employer or his agent and sent to the physician preferred by, or under contract

with, the employer; and "Whereas, such physicians who have treated such injured employees have difficulty in collecting fees for services rendered, even for emergency treatment; and

"WHEREAS, the employee, by such procedure, is deprived of free choice of a physician as provided for by the New York State Workmen's Compensation Law and advocated by the ethics of the American Medical Association; therefore, be it

"Resolved, that it is the consensus of opinion of the New York County Medical Society that the Federal Compensation Act known as Longshore-men's and Harbor Workers' Compensation Act be amended to allow injured employees to be treated by a physician of their own choice with whom they may stay until the completion of treatment."

The following resolution was introduced by the delegation to the A.M.A. and was approved:

"Whereas, employees working as longshoremen and harbor workers are covered against injury or death resulting from accidents while at work by the Federal Compensation Act (Public-No. 803-69 Congress) known as 'Longshoremen's and Harbor Workers' Compensation Act'; and

"WHEREAS, the employer of such workmen is obligated to furnish such medical, surgical, and other attendance or treatment, nurse and hospital service, medicine, crutches, and apparatus for such period as the nature of the injury or the proc-

ess of recovery may require; and

"WHEREAS, physicians in the neighborhood of docks and harbors where such injury may occur have given such injured employees emergency treatment, and have had the patient taken away from them by the employer or his agent and sent to the physicians preferred by, or under contract with, the employer; and

"WHEREAS, such physicians who have treated such injured employees have difficulty in collecting fees for services rendered, even for emergency

treatment; and

"WHEREAS, the employee, by such procedure, is deprived of free choice of a physician as provided for by the New York State Workmen's Compensation Law, and advocated by the ethics of the American Medical Association; and

"WHEREAS, the Medical Society of the State of New York went on record at its 1943 meeting in favor of an amendment providing free choice;

therefore, be it

"Resolved, that the American Medical Association seek to effect amendment of the Federal Compensation Act known as the 'Longshoremen's and Harbor Workers' Compensation Act' to allow injured employees to be treated by a physician of their own choice.

County Legislative Committees, Additional Meeting in Fall (Section 81).—The House adopted the following resolution:

"WHEREAS, the Medical Society of the County of Westchester believes that the legislative work of the Medical Society of the State of New York and the various county societies would be greatly facilitated by a conference of county society legislative committee chairmen with the State Society Legislative Committee to be held in the late fall each year, in advance of the Legislative Session, in addition to the legislative conference regularly held midway during the Legislative

"Whereas, such a preparatory conference would enable agreements to be reached for the Session; and support of legislation mandated by the House of

Your Counsel conferred with the members of the Publication Committee and with the Board of Trustees on numerous occasions with reference to the problems which arose following the death of Kent Lighty, who was the advertising manager of the New York State Journal of Medical Directory of New York, New Jersey, and the Medical Directory of New York, New Jersey, and Connecticut, and manager of the Technical Exhibits at the Annual Meetings, and handled on behalf of the Society the legal problems which arose in connection with arranging an amicable settlement of the financial obligations of the Society to the estate of Mr. Lighty. Your Counsel also was consulted with reference to the legal problems in connection with the present methods employed by the Society in connection with advertising matter appearing in the Journal and the management of the Technical Exhibits.

Your Counsel drew the contracts between the Society and Dr. Joseph S. Lawrence, its Executive Officer, Dr. Peter Irving, Secretary and General Manager, and Mr. Dwight Anderson, Director of the Public Relations Bureau and Business Manager of the Journal, and Directors.

of the Journal and Directory.
Your Counsel has conferred at various times with members of the various committees and members of the Board of Trustees on numerous phases of their work and activities.

Your Counsel is constantly in contact by telephone

and letter with Dr. Peter Irving, Secretary and General Manager of the Society, and with Mr. Dwight Anderson with regard to the many questions that frequently arise in connection with their work.

In addition, your Counsel receives frequent requests for opinions, both oral and in writing, on topics too numerous to refer to in detail within the limited space of this report. A few of the matters on which advice has been given during the past year are the following:

Legality of sterilization operations; legality of special listing of physicians; extent of interns' right to practice medicine; responsibility of physicians for acts of nurses; legal obligation of the physician in administering blood transfusions; the extent to which a nurse may practice medicine; legal liability of residents in city hospitals; liability of hospital for anesthesia accidents; liability of physician for acts of x-ray technicians; legal basis of interruption of pregnancy in mentally retarded patients; right of physician to reveal confidential information to spouse of patient; obligation of physician to inform patient of diagnosis in cancer cases; legal responsibility of physician supervising administration of anesthesia; obligation of physician relative to taking of x-rays; legal requirements for consent of parents to surgery performed upon minors.

It should be noted that daily, either by personal

It should be noted that daily, either by personal inquiry at your Counsel's office or by telephone calls, members of the Society consult your Counsel and his office staff, seeking advice and assistance on various legal problems. The greater part of these inquiries represent emergency situations which are not handled by correspondence, but entail a considerable amount of time and work.

Legislative Advice and Activities.—During the period of time that the Legislature was in session in 1943, and at the opening of the 1944 session, your Counsel examined a number of bills affecting the medical profession and gave advice with respect thereto, and also conferred with an Executive Officer of the Society regarding such bills.

Mr. Clearwater attended both the annual and the November Conferences of the Council Committee on Legislation with the Chairmen of the County Society Legislation Committees held at Albany.

Conclusion.—Your Counsel closes this report, as his predecessor has in previous years, by expressing his deep appreciation for the work of his office staff, and he also wishes to note with grateful thanks the advice and assistance of the members of your Society who have helped us, both in court and in consultation, in the defense of malpractice actions. Their cooperation and assistance made it possible for your Counsel to obtain the results shown in this report.

Respectfully submitted, WILLIAM F. MARTIN, Counsel

## Amendments to Constitution and Bylaws

To the House of Delegates; Gentlemen:

At your last meeting there were introduced three amendments to the Constitution and Bylaws which will come before you for action at your coming Annual Meeting on May 8, 1944. In addition, action was postponed on another two amendments that had been originally introduced in 1942.

Because two of these new amendments are on the

same subject—change in the number of county society delegates—and because the language and intent were not fully clear, it has been thought best this year to have a reference committee to aid in clarification. Action, of course, will be under the Constitution by the House as a whole, with two-thirds vote of members of the House present and voting necessary for adoption.

and Lloyd Paul Stryker, has personally conducted the defense of hundreds of malpractice actions throughout the courts of the State of New York,

in all parts of the State.

During the reporting period certain other changes in personnel of the staff of your Counsel's office have taken place. Mr. Robert J. Bell, who for nearly ten years was an associate of your Counsel and his predecessor, entered the active service of the United States Navy, having received a commission as lieutenant, junior grade.
Mr. John J. De Luca, an attorney of excellent

qualifications and experience, has become associated with your Counsel's legal staff. In addition, Mr. Thomas J. Finnegan, an attorney of years of experience at the New York bar, has become associated

with the staff in a part-time capacity.

Mr. Thomas H. Clearwater, who has, since 1930, been the attorney for your Society and who is well known to many members of your Society throughout the State, is continuing in the same capacity with your Counsel. The efficient clerical staff of the late Lorenz J. Brosnan has remained intact.

In making this report we must seek to obtain brevity, and necessarily can submit only the barest outline of the work done in our department, which does not give a full picture of the work done or the responsibility assumed by our department.

We wish to record our appreciation for the assistance and cooperation furnished by your officers and committeemen. It has been a pleasure to work with

In making this report your Counsel adheres to the convenient category employed in previous years, whereby his activities have been divided into three main divisions: (a) the actual handling of malpractice actions before courts and juries and in the appellate tribunals; (b) counsel work with officers, committees, and individual members of the Society; and (c) legislative advice and activities.

Litigation.—As our predecessors on numerous occasions have done before us, we call to the attention of the members the dangers of careless, hasty, and unjust criticism by one physician of the work of We realize that in most instances the criticizing doctor does not intend to inspire a malpractice action by such comments, but it is true that frequently they are sufficient to stimulate in the mind of a patient an intention to institute litiga-tion against another physician. Experience has shown that many malpractice actions originate from such careless criticism.

At the risk of repetition, we call to the attention of your membership the ever present hazard of a malpractice action to the practicing physician. In such actions the rights of the physicians are in the hands of lay jurors, who often may be unduly in-fluenced by factors that do not go to the merits of the case, and we do know that daily jurors are rendering verdicts which in part, at least, are influenced by

sympathy, passion, prejudice, or bias.

It is difficult to understand why more of your members do not avail themselves of the Group Plan of insurance sponsored by the State Society. though a great percentage of the members carry such insurance, no month goes by in which we do not meet one or more physicians facing a lawsuit without the benefits of this insurance. Invariably they regret their failure to take advantage of the Group Plan. The Group Plan has now been in operation for well over twenty years and its outstanding success is a matter of record. It merits the loyal support of every member of the Society.

At this point we wish to mention The Yorkshire Indemnity Company, the carrier under your Group Plan for over eight years. It has in every way fully discharged all of its obligations and it has demonstrated a continuing and enthusiastic interest in the successful operation of our Group Plan. We record our appreciation of the cooperation of Mr. Horace Crowell, Jr., Superintendent of Claims of The Yorkshire Indemnity Company, with whom your Counsel and associates are in almost daily conference and consultation, and of Mr. Alan O. Robinson,

vice-president of the said Company.

Mention should be made of the splendid work of your insurance company under the chairmanship of Dr. Clarence G. Bandler. We have conferred on a number of occasions during the reporting period with Dr. Bandler in relation to the problems of the

Insurance Committee.

We are pleased to point out that through the efforts of Dr. Bandler and the cooperation of Col. H. F. Wanvig, the Indemnity Representative of your Society, and of The Yorkshire Indemnity Company, it has been arranged, after a review of the cost of operating the Group Plan for the past eight years, that commencing April 1, 1944, substantial reduc-tions in premium rates will be made. These reductions will include favorable changes in the base rate,

excess limits, and special endorsements. With these preliminary statements, we note that there were commenced within the present reporting period 87 cases. This figure is substantially lower than the figure reported a year ago, and still lower than the figure reported two years ago. It must be taken into consideration that many members of the medical profession are in the armed forces. Statutory provisions have been made whereby numerous malpractice cases which might have been instituted against physicians now in the armed forces may still be instituted against them upon their return to private life, and it is reasonable to anticipate that upon the cessation of hostilities and the discharge of these physicians from the armed forces, the number of such cases which will arise in the future could show a substantial increase. The 87 cases referred to, of course, do not include a number of claims outstanding on which suit may ultimately be brought. The preventative work done by your counsel and his office staff is of equal importance with the actual work of litigation. Throughout the year we are in consultation with many claimants and their at-torneys, and frequently have been successful in demonstrating to them that, in fact and in law, no Many of these claims consevalid claim exists.

quently never actually become lawsuits.

Table 1 shows that during the present reporting period we disposed of 92 cases. Thirty-seven of these cases were settled and 52 terminated successfully in favor of the physician. In 3 cases there were judgments for the plaintiff. We note from Table 1 that there were pending, as of January 31,

1944, 364 cases.

Counsel Work.—During the period of this report your Counsel, and until his death Mr. Brosnan, and Mr. Clearwater have attended the Annual Meeting of the Society and the regular meetings of the Council of your Society and have conferred with members of those bodies upon numerous legal problems which have presented themselves.

Your Counsel, acting with the Committee on By-Laws, examined various proposed amendments to the Constitutions and By-Laws of a number of component member societies, and has rendered advice and made suggestions in connection therewith.

. . . . The question was called for, and the motion was put to a vote, and was unanimously carried . . SPEAKER BAUER: They will remain in the hands

of the Secretary, and be republished next year. The meeting is now open for the introduction of

resolutions. The amendments as introduced in 1942 follow:

#### Article XIV

#### Medical Benevolence Fund

"There shall be created a Benevolence Fund under the terms and conditions outlined in Chap-ter XII, Article 4, of the Bylaws. For this pur-pose there shall be appropriated by the Trustees out of the funds of the Society a sum not to exceed fifty cents per active member per year, to be set aside by the Treasurer as a special fund for the purpose of this Article. This fund shall be kept separate and invested or distributed by direction of the Board of Trustees of the Society under rules and regulations approved by the latter. The fund shall be used only for the relief of pecuniary distress of sick or aged members who are or have been active members in good standing of the Society."

#### Chapter XII, Section 4 Special Committees

"Section 4-The President of the Society shall appoint, immediately after the Annual Meeting, a special committee of five to be known as the Special Committee on Benevolence of the Medical Society of the State of New York, consisting of two members from the Board of Trustees to be selected by the Chairman of the latter, the Treasurer, the Secretary, and a representative from the Woman's Auxiliary of the State Society to be selected by its President. This Committee shall select its own Chairman and have absolute jurisdiction over the distribution of such funds as have been allotted by the Society's Finance Committee from current income after appropria-tion by the Board of Trustees. No moneys shall be paid except on warrants signed by the Chairman of the Committee and the Treasurer. Committee shall formulate rules and regulations for the acceptance of beneficiaries for consideration and approval by the Council. It may solicit subscriptions, donations, and legacies to be added to the principal of the Benevolence Fund. It shall present a detailed audit of receipts and expenditures, included in an annual report of its activities to the Council and the House of Delegates."

> Respectfully submitted, LOUIS H. BAUER, M.D., Speaker Peter Irving, M.D., Secretary

March 1, 1944

## Reports of the District Branches

#### First District Branch

To the House of Delegates; Gentlemen:

The thirty-eighth Annual Meeting of the First District Branch was held at Grasslands Hospital,

Valhalla, New York, November 16, 1943.

This was a very satisfactory and pleasing one-day session, from 9:00 A.M. to 4:00 P.M., and followed quite closely the pattern of a meeting previously held at St. Joseph's Hospital, Yonkers, New York. The attendance was fair for this type of meeting, but did not compare favorably with the attendance at the meeting held at New York Hospital.

Grasslands is an excellent institution for similar meetings for medical men from the First District

Branch.

The program, divided into a morning and an afternoon session, was splendidly arranged, and the speakers and subjects chosen were most interesting.

speakers and subjects chosen were most interesting. In the morning session, devoted to surgery, rederick McClellan, M.D., New Rochelle, New York, chose for his topic, "Evaluation of Prostatic Obstruction." Wilfrid D. Wingebach, M.D., Bronxville, New York, gave a lecture entitled "Discussion of Surgical Conditions Within the Spinal Canal," and Win Henry Watters, M.D., White Plains, New York, orthopaedic surgeon, Gravlands Hospital, spoke on "Supracondyle Fracture in Children." George C. Adie, M.D., New Rochelle, New York, director of surgery, Grasslands Hospital, chose as his subject "Thoracic Surgery—Application in General Medicine." Surgery-Application in General Medicine."

An excellent luncheon followed the morning session, at which time Dr. Thomas A. McGoldrick, Brooklyn, President of the Medical Society of the State of New York, delivered a timely address on the effective efforts being made by the Society on the present medical problem.

the present medical problem.

At the afternoon session, devoted to a medical rogram, the following subjects were presented:
"Extra Human Poliomyelitis," by Gilbert Dalldorf,
M.D., director of laboratories, Grasslands, department of pathology; "Diagnosis and Chemotherapy
of Maningagacus and Other Forms of Meningitis." of Meningococcus and Other Forms of Meningitis, by Horace E. Robinson, M.D., Pleasantville, New York, formerly attending physician, communicable diseases, Grasslands Hospital (deceased); "Applica-tion of Functional Tests in the Treatment of Liver Disease," by Reid R. Heffner, M.D., New Rochelle, assistant director and attending physician in in-ternal medicine, Grasslands Hospital; "An Un-usual Case of Bacterial Endocarditis," by Fellowes Morgan Pruyn, M.D., Mt. Kisco, New York, adjunct attending physician in internal medicine, Grasslands Hospital.

The morning session was under the supervision of Dr. George C. Adie, and the afternoon session was under Dr. M. D. Touart, Bronxville, chief of the medical service at Grasslands Hospital. No business

was discussed.

was discussed.

Among those present were Dr. Peter Irving, Secretary and General Manager, State Medical Society; Dr. Joseph Lawrence, Executive Officer, State Medical Society, Dr. Nathan B. Van Etten, Past President of the A.M.A., and Dr. Edwin C. Podvin, Assistant Secretary, State Medical Society.

The First District Branch wishes to express its days expression, through the Director Dr. E.

deep appreciation, through the Director, Dr. E. L. Harmon, to Grasslands Hospital and to other participating physicians for the splendid arrangements and very excellent luncheon which made this meeting an outstanding event.

> Respectfully submitted, JAMES G. MORRISSET, M.D., President

February 11, 1944

The amendments follow, with excerpts from the minutes (by "Sections") of the 1943 meeting.

Section 68

Proposed Amendment to Bylaws, Chapter II, Section 1

Dr. J. Stanley Kenney, New York: This is a resolution to amend the Bylaws, Chapter II, Section 1, of the Medical Society of the State of New York:

"Whereas, the recently enacted reapportionment bill is based upon the population ratio and will thereby cause a redistribution of delegates from the component medical societies to the House of Delegates to the Medical Society of the State of New York; therefore be it

"Resolved, that the number of delegates from

any component medical society be not reduced from their present number unless there has been a material reduction of the number of physicians in

the area of any county medical society."

DR. ALFRED M. HELLMAN, New York: I second that.

SPEAKER BAUER: This being an amendment to the Bylaws, no action is required on it at this time, but it will remain in the hands of the Secretary and be acted on next year after due publication.

Section 89

Proposed Amendment to Bylaws, Chapter II, Section 1

Dr. Albert A. Cinelli, New York: This is an amendment to the Bylaws of the Medical Society of the State of New York, Chapter II, Section 1. Under (c) which now reads:

"Each component county society shall be entitled to elect as many delegates as there shall be State Assembly Districts in each county at the time of the election, but each component county medical society shall be entitled to elect at least one delegate"

is to be amended to read:

"Each component county society shall be entitled to elect delegates in proportion to the number of doctors practicing in the county at the time of election, but each component medical society shall be entitled to elect at least one delegate."

DR. HORACE E. AYERS, New York: I second that. SPEAKER BAUER: There was an amendment introduced yesterday to the same article. This will remain in the hands of the Secretary for one year, when, after being duly published, it will come before you for consideration.

Section 83

Proposed Amendment to Bylaws, Chapter X, Section 1

Secretary Irving: Mr. Speaker, there is in Part XII of the Council Report a matter that did not come before that reference committee, which I think should be read now. This is an amendment submitted by the Council to be acted on a year from now. I will read it. It is a small thing, so it will not take very long:

"Travel Expenses of Delegates to A.M.A.—The Council recommends that Chapter X of the Bylaws be amended to allow delegates to the American Medical Association the usual travel expenses such as are allowed to members of Council, Trustees, Censors, and members of committees, in-

stead of only 'railroad transportation and Pullman accommodations.' To that end the Council submits the following amendment:

"In Chapter X, Section 1, of the Bylaws delete the sentence which reads: "The delegates to the American Medical Association who have attended each session of the House of Delegates of that Association and who shall have filed with the Secretary evidence of such attendance shall be allowed the actual cost of railroad transportation and Pullman accommodations to the place of meeting and return, and insert in its place the following sentence: "The delegates to the American Medical Association who have attended each session of the House of Delegates of that Association and who shall have filed with the Secretary evidence of such attendance shall be allowed traveling expenses."

SPEAKER BAUER: This being an amendment, it will remain in the hands of the Secretary until next year when, after being duly published, it will come before you for consideration.

Section 19

Constitution and Bylaws Amendments—Action Delayed One Year

SPEAKER BAUER: The next two amendments are tied together, and I suggest you read them both: New Article, No. XIV, to the Constitution, and New Section, No. 4, to Chapter XII of the Bylaws.

Secretary Inving: My understanding is that the member who introduced those two amendments would like to have them withdrawn. This is Dr.

Kosmak.

DR. GEORGE W. KOSMAK, New York: I should like to ask that consideration on these resolutions be postponed until the next year's meeting of the House of Delegates.

SPEAKER BAUER: Dr. Kosmak, in effect, moves that consideration of these amendments be postponed until next year's meeting. Is there a second

to that motion?

DR. Kirby Dwight, New York: I will second it. Dr. Chas. Gordon Heyd, New York: A question of order: These have been published for action at this meeting. It seems to me that the motion should be that they be withdrawn, after which they can be reintroduced, but I know of no mechanism which can, after publication of a projected change in the Constitution and Bylaws, avoid a vote on it. Unless they are withdrawn, there is no mechanism, in my opinion, by which to postpone action upon them until next year. In order for us to take that course they must be reintroduced and we must follow the plan laid down for all changes in the Constitution and Bylaws.

SPEAKER BAUER: It is true that amendments cannot be tabled, but action on an amendment could be postponed until the following year because it amounts to the same thing as giving notice that one intends to bring the amendment up next year. I take it that that is the meaning of Dr. Kosmak's motion—that he wishes no action taken this year, but he is giving notice that he will reintroduce them, so that after republication they may be acted upon next year. Is that correct, Dr. Kosmak?

Dr. Kosmak: That is correct, Mr. Speaker. Speaker Bauer: Does that satisfy you, Dr.

Heyd?
DR. CHAS. GORDON HEYD: Yes.
SPEAKER BAUER: Is there any discussion on the
motion?

motion pictures taken during his big-game hunting

expeditions in Alaska.

During the afternoon, while the men were at the meeting, the ladies were entertained by the ladies of the Saratoga County Woman's Auxiliary to the Medical Society.

> Respectfully submitted, HAROLD A. PECK, M.D., President

February 8, 1944

#### Fifth District Branch

To the House of Delegates: Gentlemen:

I have the following report to make concerning the activities of the Fifth District Branch for the year 1943.

The meeting of the Fifth District Branch was held on Wednesday, September 22, 1943, at the Hotel Syracuse. There were 119 members and 7 visitors present, making a total of 126 in attendance.

The program was very interesting. It was as follows: 2:30 P.M., "Common Diseases of the Skin," with lantern slide illustrations, by Dr. Leon H. Griggs, associate professor of dermatology, Syracuse University College of Medicine; 3:30 P.M. to 5:30 P.M., a symposium by the department of obstetries of the Syracuse University College of Medicine: "The Use of Caudal Anesthesia in Obstetrics," by Dr. Francis Irving, clinical professor of obstetrics, Syracuse University College of Medicine, with discussion by Dr. Charles Albertson Lippincott and Dr. Frank Meyer; "Episiotomy—Recent Technics," by Dr. R. J. Pieri, clinical professor of obstation Surgery University College of fessor of obstetrics, Syracuse University College of Medicine: "The Significance of Vaginal Bleeding During the Third Trimester of Pregnancy," Dr. Merton Hatch, associate professor of obstetrics, Syracuse University College of Medicine; "Recent Advances in Cesarean Section," by Dr. Vincent Hemmer, associate professor of obstetrics, Syracuse University College of Medicine; and "Control of Late Toxemias of Pregnancy," by Dr. E. C. Hughes, professor of obstetrics, Syracuse University College of Medicine.

Following the dinner at 6:00 P.M. the President of the State Society, Dr. Thomas A. McGoldrick, discussed the medical features of the Wagner-

Murray-Dingell bill.

Election of officers resulted as follows: president, Dr. Dan Mellen, Rome; first vice-president, Dr. Sherman M. Burns, Oswego; second vice-president, Dr. H. Dan Vickers, Little Falls; secretary, Dr. J. E. McAskill, Watertown; treasurer, Dr. O. D.

Chapman, Syracuse.

Chapman, Syracuse.

At the scientific meeting at 8:00 p.m. two lectures were given. The first was "Lesions and Abnormalities About the Mouth," illustrated with Kodachrome slides, by Dr. J. E. McAskill of Watertown. The next was "Meningococcal Infections," by Dr. J. Howard Ferguson, professor of pathology, Syracuse University College of Medicine. The discussion was by Dr. O. D. Chapman, professor of bacteriology, Syracuse University College of Medicine, and Dr. A. C. Silverman, professor of pedicine, and Dr. A. C. Silverman, professor of pedicine, and Dr. A. C. Silverman, professor of pedi-

atrics, Syracuse University College of Medicine.
The Executive Committee of the Fifth District Branch offered to the Woman's Auxiliary of the county societies a prize of twenty-five dollars to be awarded to that county society which had the largest percentage in attendance. Oswego County

was awarded the twenty-five dollars.

It was generally agreed that the meeting was one of the most instructive and satisfactory held for many years.

> Respectfully submitted, EDWARD C. REIFENSTEIN, M.D., President

February 8, 1944

#### Sixth District Branch

To the House of Delegates; Gentlemen:

The thirty-seventh annual meeting of the Sixth District Branch of the Medical Society of the State of New York was held at Willard Straight Hall, Ithaca, New York, on Tuesday, September 28, 1943. The total attendance was 133. Only 65 of the persons present were from the District; the remaining 58 were medical and veterinary students at Cornell University.

The impact of war was felt more by the Society this year than last. Not only were a large number of physicians from central New York serving in the armed forces, but those at home were hampered because of extra work and difficulty in obtaining gasoline to attend the meeting. An unusual program

had been arranged.

The morning featured a lecture entitled "Continuous Caudal Anesthesia," was given by Dr. Francis R. Irving, clinical professor of obstetrics, Syracuse University School of Medicine. Dr. E. F. Hall, of Ithaca, discussed Dr. Irving's paper. The next paper was "Hematuria," by Dr. Thomas J. Kirwin, attending surgeon, Brady Clinic, New York Hospital. Dr. John Wattenberg, of Cortland, led the discussion.

At luncheon the members and guests heard a most inspiring address by Dr. Thomas A. McGoldrick, President of the Medical Society of the State of

New York.

This was followed by the election of officers.

Dr. Clifford F. Leet, of Horseheads, was elected president; Dr. Charles L. Pope of Binghamton, was re-elected first vice-president; Dr. Norman C. Lyster, of Norwich, was re-elected second vice-president; Dr. Hubert B. Marvin, of Binghamton, was re-elected secretary; and Dr. William A. Moulton, of Candor, was re-elected treasurer.

At the afternoon session two important papers were given—the first, "Physiological Considerations in the Treatment of Burns," by Lt. Herbert Brown, (MC), USNR, Philadelphia, and the second, "Anticoagulants," by A. Wilbur Duryee, associate clinical professor of medicine, New York Post-Graduate Medical School, Columbia University.

The afternoon papers evoked considerable comment. Discussion of the first paper was opened by Dr. H. B. Sutton, of Ithaca, and of the second by

Dr. Herbert Ensworth, of New York.

During my administration of the Sixth District Branch, each county society was contacted and some of them visited in the interest of setting up War Participation Committees. Emphasis was placed on the importance of the proper functioning of these committees. This has been a difficult time for the constituent medical societies of the District. Many members are in the armed services; the ones left at home are pressed for time. However, every effort should be made to stimulate more interest in the changing order of medicine. There is no Medical Indemnity Insurance Plan available for many of the counties of the District. I hope the

## Second District Branch

To the House of Delegates; Gentlemen:

The thirty-seventh annual meeting of the Second District Branch of the Medical Society of the State of New York was held on November 17, 1943, at the United States Naval Hospital at St. Albans.

An inspection of the new hospital began at 9:00 A.M. During the following two hours small groups of visitors were conducted through the hospital by members of the medical staff and by nurses. Several hundred physicians, members of the four county auxiliaries, and their guests thus had the opportunity, rarely afforded one outside the armed services, to inspect this new institution. At 11:00 A.M. the visitors congregated in the new auditorium, which, though not completely finished, was opened for this occasion. Between 11:00 A.M. and 12:30 P.M. three very interesting papers were delivered by members of the naval hospital staff. The first was on "Compound Fractures," by Lt. Comdr. Toumey, the second on "The Use of Penicillin," by Lt. Comdr. Hudson, and the third on "Medical Problems Associated with War Mobilization and Duty in the Field," by Lt. Comdr. Marr. All papers were well received and all brought forth much interesting discussion.

At luncheon 433 members and guests sat down in the officers' mess with our host, Capt. L. L. Pratt, the commanding officer of the hospital, and his staff. The excellence of the food and service was widely commented upon by those present.

At 2:00 P.M. the physicians returned to the auditorium while members of the Woman's auxiliaries went to the recreation room, where they played bridge.

The afternoon session was addressed by the President of the State Society, Dr. Thomas A. McGoldrick, who spoke on political trends as they affect the medical profession, and by Dr. Allen O. Whipple, professor of surgery at Columbia University, who spoke on the newer trends in the treatment of war injuries, especially burns and fractures. Dr. Whipple had recently returned from North Africa and he kindly substituted for Dr. Owen H. Wangensteen, who was unavoidably detained in Washington. Both papers were well received by the members present.

This meeting was unique in several ways. First, it was the largest meeting in point of attendance the branch has ever held. Also, it was the only meeting that ever returned a profit. We were able, after all accounts were settled, to present to the American Red Cross, U.S. Naval Hospital, St Albans Chapter, a check for \$200.85, representing the every sof receipts over expenditures.

the excess of receipts over expenditures.

The meeting was marred by only one sad incident, the announcement of the untimely death of our second vice-president, Dr. Charles W. Martin, which had occurred the previous day. Dr. Martin will be greatly missed by his colleagues and his host of friends both in and outside the profession.

of friends both in and outside the profession.

Our thanks are due to Captain Pratt, his executive officer, Captain Adams, and all their staff for their fine and hearty cooperation with your officers in making this an outstanding meeting.

Respectfully submitted,

FRANCIS G. RILEY, M.D., President

## Third District Branch

To the House of Delegates; Gentlemen:

The annual meeting of the Third District Branch was held at the Hendrick Hudson Hotel, Troy, on September 21, 1943. The attendance was approximately 100.

During the afternoon session the participants conducted an excellent scientific program. Moving pictures of medical work at the front were shown. A general discussion on parasitic diseases was conducted.

Following the scientific program a dinner was held. The speakers were representatives of the Army and Navy who related some firsthand experiences in the combat areas.

On January 19, 1944, a meeting of the executive committee and representatives of the seven component county societies was held at the De Witt Clinton Hotel, Albany, to discuss the Wagner-Murray-Dingell bill relative to governmental supervision of medical care. After a lengthy discussion in which each one present took part, a resolution was adopted disapproving of the medical features of the bill. Various plans were discussed to be used in accomplishing the defeat of this bill, if and when it comes out of committee in the Senate. As this was the off year, no election of officers was held.

Respectfully submitted, Stephen H. Curris, M.D., President

February 25, 1944

#### Fourth District Branch

To the House of Delegates; Gentlemen:

The Fourth District Branch of the Medical Society of the State of New York held its thirty-seventh Annual Meeting at Newman's Lake House in Saratoga, New York, Thursday, September 23, 1943. Nine of the ten counties comprising the Branch were represented at the meeting. Seventy-six members were present.

The afternoon meeting consisted of three papers. The first was "Treatment of War Injuries," by Col. A. J. Canning, (MC), USA. Colonel Canning was at Pearl Harbor on duty at Schofield Barracks at the time of the Japanese bombing and gave us a word picture of treatment of the wounded and burned personnel of that great base. "The Allergic Child" was presented by Dr. Bret Ratner, clinical professor of pediatrics, New York University College of Medicine. Dr. Ratner discussed the commoner types of allergy and the treatment thereof. "Clinical and Laboratory Studies of Burns with Special Reference to the Cocoanut Grove Fire," by Drs. Edward A. Cooney and Stanley Levenson of Boston, Massachusetts, was the third paper. These talks were illustrated with pictures of the burns before and after treatment and gave the listeners the results of the different types of treatments used and told what, in the experience of the speakers, had been

the most satisfactory.

In the evening, dinner was served to 136 members, their wives, and their friends. After dinner there was an address by Dr. Thomas A. McGoldrick, President of the State Society, who gave us a little insight into the things to come in state and federal medicine, providing that we do not get busy and medicine, providing that we do not get busy and medicine, providing that we do not get busy and suggest measures to counteract these trends. Following Dr. McGoldrick's talk we were entertained by Dr. G. Scott Towne, of Saratoga, who showed

## 1944 Annual Meeting

## Medical Society of the State of New York

May 8, 9, 10, 11—The Hotel Pennsylvania, New York City

## House of Delegates

The regular annual meeting of the House of Delegates of the Medical Society of the State of New York will be called to order at 10:00 a.m. on Monday, May 8, 1944, in the Keystone Room, Balcony Floor of the Hotel Pennsylvania, New York City.

In accordance with Chapter II, Section 3, of the revised Bylaws, the House will assemble according to the following schedule:

Monday, May 8, 1944 10:00 a.m. and 3:30 p.m. TUESDAY, May 9, 1944 9:00 a.m. and 1:00 p.m.

At the last adjourned session (1:00 P.M., Tuesday, May 9) the election of officers, councilors, trustees, and delegates will occur in accordance with Chapter III, Section 1, of the revised Bylaws.

In order that members of Reference Committees may be enabled to attend all sessions of the House, all Reference Committees except the Credentials and New Business Committees are urged to meet on Sunday afternoon, May 7, 1944, so that they can complete the majority of their work prior to the assembling of the House on Monday. Officers and Chairmen of Council Committees are likewise urged to be present on Sunday afternoon so that they may appear before the appropriate reference committees.

LOUIS H. BAUER, M.D., Speaker PETER IRVING, M.D., Secretary

## 138th Annual Meeting

This year, as last year, the decision has been to have no banquet. The Annual Meeting will take place at 2:30 r.m. or as

near thereafter as possible, following adjournment of the last session of the House of Delegates. The place will be the Keystone Room, Balcony Floor. The Society will be called to order by the President, with the reading of the minutes by the Secretary.

THOMAS A. McGoldrick, M.D., President \*Peter Irving, M.D., Secretary

## Registration

Registration will be held in the Hotelfor delegates on Monday, May 8, after 9:00 A.M.; for members, on Monday, Tuesday, Wednesday, and Thursday, May 8, 9, 10, 11, from 9:00 A.M. to 6:00 P.M.

#### Exhibits

Scientific and Technical Exhibits will be located in the Hotel.

Scientific Motion Pictures will be shown. See Official Program for details.

#### Scientific Sessions

General Sessions on Tuesday and Thursday afternoons. Section and Session meetings will be held on Tuesday morning, Wednesday morning and afternoon, and Thursday morning.

## New York State Association of School Physicians

This year, as last year, the School Physicians, on invitation, will hold meetings in the afternoon and evening of Monday, May 8, with a dinner to be arranged. (See page 816 for the program.)

## Woman's Auxiliary

See page 814 for the program.

day is not far away when a Plan will be available to all the counties of the District.

Respectfully submitted

NORMAN S. MOORE, M.D., President February 21, 1944

### Seventh District Branch

To the House of Delegates; Gentlemen:

The thirty-seventh annual meeting of the Seventh District Branch was held on Thursday, September 30, 1943, at the Academy of Medicine in Rochester. There were 130 members present.

The meeting came to order at 10:00 A.M., with an hour devoted to the showing of motion pictures

by the British Information Services.

Dr. Richard B. Cattell, surgeon, of the Lahey Clinic, Boston, New England Deaconess Hospital, and New England Baptist Hospital, then read a paper on "Recent Improvements in Biliary Tract Surgery," illustrating it with lantern slides.

The District Branch then went into its business meeting and elected the following officers for the meeting and elected the following officers for the ensuing two years: president, Homer J. Knickerbocker, Geneva; first vice-president, Howard S. Brasted, Hornell; second vice-president, Lloyd F. Allen, Pittsford; secretary, Kenneth T. Rowe, Dansville; treasurer, George H. Gage, Rochester.

After luncheon, officers of the State Medical Society were introduced: Dr. Thomas A. McGoldrick President: Dr. Peter Lyving Secretary and

rick, President; Dr. Peter Irving, Secretary and General Manager; Dr. Joseph S. Lawrence, Executive Officer; and Mr. Dwight Anderson, Director of the Bureau of Public Relations.

Dr. McGoldrick gave an address in which opposition was expressed to the medical provisions of the Wagner-Murray-Dingell bill in sound and forceful

fashion. The scientific program was then continued with two papers. Dr. L. T. Coggeshall, of the School of Public Health, University of Michigan, Ann Arbor, spoke on 'Postwar Tropical Disease Problems.' Dr. David P. Barr, professor of medicine, Cornell University Medical College, New York, spoke on 'The College, New York, spoke on the College, New York, spoke "The Role of Myocardial Disease in Heart Failure."

Respectfully submitted, BENJAMIN J. SLATER, M.D., President

March 1, 1944

### Eighth District Branch

To the House of Delegates; Gentlemen:

The thirty-eighth annual meeting of the Eighth District Branch was held at Buffalo at the Hotel Statler on Wednesday, September 29, 1943. There were about 125 present.

The morning session began at 10:00 A.M. with a talk on "Industrial Dermatitis" by Dr. Joseph L Morse of New York. This talk was interesting and instructive because of the ever increasing number of cases of industrial dermatitis brought about by the many different kinds of war industries.

The second paper of the day was given by Dr. Burrill Crohn, New York, on "Peptic Ulcer." Dr. Crohn brought out many interesting points about the diagnosis and treatment of this condition.

Both of these papers were well received and freely discussed by the members who were present.

After luncheon Dr. Thomas A. McGoldrick, Brooklyn, President of the Medical Society of the State of New York, read a paper emphasizing forcibly many facts about the progress of medicine and also stated that we must be on the alert to combat the insidious attempts to force on the American people any foreign system of medical practice.

The nominating committee, consisting of Dr. William D. Johnson, Batavia, Dr. Herbert H. Bauckus, Buffalo, and Dr. Abraham H. Aaron, Buffalo, reported the slate of officers for the next Buttalo, reported the slate of officers for the next two years and the following were duly elected: president, Dr. Peter J. Di Natale, Batavia; first vice-president, Dr. Robert C. Peale, Olean; second vice-president, Dr. John C. Kinzly, North Tonawanda; secretary, Dr. William J. Orr, Buffalo; treasurer, Dr. Henry S. Martin, Warsaw.

Dr. Herbert H. Bauckus, Buffalo, President-Elect of the Medical Society of the State of New York, and Dr. Carlton E. Wertz, Buffalo, spoke briefly on the medical and hospitalization plan. They expressed a desire that more active interest should

pressed a desire that more active interest should and must be shown by the physicians in getting the present plans before the people so that more of them would participate in the voluntary plans for medical and hospital care.

In the afternoon Dr. Herman O. Mosenthal, New York, spoke on "Chronic Nephritis." Dr. Donald Guthrie, Sayre, Pennsylvania, spoke on "Important Points in the Surgical Treatment of Brain Tumors." Dr. Guthrie showed some interesting slides.

These papers were very instructive, were pre-sented in an excellent manner, and were freely

discussed. Since Dr. Robert C. Peale, President of the Branch, is in the service, it falls upon me to make this report.

Respectfully submitted, PETER J. DI NATALE, M.D., Vice-President

March 2, 1944

### SECTIONS

All papers read before the Society by members become the property of the Society. The *original* copy of each paper shall be left with the secretary of the Section.

Discussers should have their remarks typed, double-spaced, and hand

them to the secretary.

Time limits: Twenty minutes for each paper, five minutes for individual discussion.

New York

York

Section meetings shall begin promptly at the hour specified.

# Section on INDUSTRIAL MEDICINE AND SURGERY

Chairman....Orvis A. Brenenstuhl, M.D., Albany Secretary.....Russell C. Kimball, M.D., Brooklyn

> Tuesday, May 9-10:00 A.M. New York Post-Graduate Hospital

"The Severely Injured Employee—Early and Late Treatment"
John J. Moorhead, M.D., of the Department of Traumatic Surgery, Bellevue Hospital, New York Post-Graduate Medical School and Hospital will conduct this session at Post-Graduate Hospital.

Wednesday, May 10—10:00 A.M. Hotel Pennsylvania, Foyer of Keystone Room

"Scope of an Industrial Medical Service—Description of the Type and Scope of Service Available to Employees"

Haynes H. Fellows, M.D., New York Discussion: John J. Wittmer, M.D., Brooklyn; and Philip L. Forster, M.D., Albany General Discussion

# Section on MEDICINE

Chairman .. Frederic W. Holcomb, M.D., Kingston Vice-Chairman.Frederick W. Williams, M.D., Bronv Secretary.....Harold F. R. Brown, M.D., Buffalo

Wednesday, May 10—10:00 A.M. Hotel Pennsylvania, Keystone Room

Joint Meeting with the Section on Surgrey (See Section on Surgery)

Thursday, May 11—10:00 A.M. Hotel Pennsylvania, Roof, South Part

- "Problems in the Postoperative Care of Cancer Patients" Norman Treves, M.D., Memorial Hospital, New York
- "The Atypical Pneumonias"
   William S. Tillett, M.D., Department of
   Medicine, New York University College of
   Medicine, New York
- "Problems of Treatment of Tropical Diseases in Returning Military Personnel" Henry E. Meleney, M.D., Department of Preventive Medicine, New York University College of Medicine, New York

General Discussion

# Section on NEUROLOGY AND PSYCHIATRY

Chairman.....Angus M. Frantz, M.D., New York Secretary......Albert E. Siewers, M.D., Syracuse

### Tuesday, May 9-10:00 A.M. Hotel Pennsylvania, Parlor 1

- "The Electrofit in Depressions—Comparison of Hospital and Privately Treated Patients" David J. Impastato, M.D., New York John Frosch, M.D., New York Renato J. Almansi, M.D., New York S. Bernard Wortis, M.D., New York
- "Electric Sleep Therapy"
   Foster Kennedy, M.D., New York
- "Alcoholics Anonymous"
   William G. Wilson, New York (By invitation

Wednesday, May 10—2:00 P.M. Hotel Pennsylvania, Manhattan Room

Joint Meeting with the Section on Pathology and Clinical Pathology (See Section on Pathology and Clinical Pathology)

# Section on RADIOLOGY

Chairman...E. Forrest Merrill, M.D., New York Vice-Chairman...Alfred L. L. Bell, M.D., Brooklyn Secretary.....Lee A. Hadley, M.D., Syracuse

> Wednesday, May 10—10:00 A.M. Hotel Pennsylvania, Conference Room 2

1. Symposium

Changes Which Have Resulted from the Use of Sulpha Drug Therapy

"In the Treatment of Chest Conditions" Chester O. Davison, M.D., Poughkeepsie

"In Mastoid X-Rays"
William Richard Cashion, M.D., Jackson
Heights

"In the Management of Osteomyelitis"
James M. Flynn, M.D., Rochester
Discussion of Symposium opened by Frederick S.
Wetherell, M.D., Syracuse

 "Observations on the Use of a New Material for Cholecystography"
 Lois C. Collins, M.D., New York (By invitation)
 Ross Golden, M.D., New York
 Discussion: Eric J. Ryan, Lt. Comdr., (MC), USN, New York

"Myelography with Pantopaque"
 George H. Ramsey, M.D., Rochester
 J. Douglas French, M.D., Rochester
 William H. Strain, Ph.D., Rochester (By invitation)
 Discussion opened by Arthur B. Soule, Jr., Maj., (MC), AUS, Staten Island (By invitation)

Thursday, May 11—10:00 A.M. Hotel Pennsylvania, Conference Room 2

- "The Role of the Hospital in Medical Care" Mac F. Cahal, J.D., Dallas, Texas (By invitation)
- 2. Round-Table Discussion

The discussion will be in the nature of a "quiz." Radiologists will submit problem films with brief résumés of relevant information. Discussion leaders are:

Ross Golden, M.D., New York, Chairman Merrill C. Sosman, M.D., Boston, Massachusetts (By invitation) Robert E. Pound, M.D., New York

### Section on SURGERY

Chairman.....W. J. Merle Scott, M.D., Rochester Secretary.....Beverly C. Smith, M.D., New York

Wednesday, May 10-10:00 A.M. Hotel Pennsylvania, Keystone Room

Joint Meeting with the Section on Medicine

### Symposium

THE ETIOLOGY, DIAGNOSIS, TREATMENT, AND PROGNOSIS OF ESSENTIAL HYPERTENSION

 "Recent Advances in Etiology, Diagnosis, and Treatment of Essential Hypertension" Irvine H. Page, M.D., Indianapolis, Indiana (By invitation)

2. "Medical Treatment and Prognosis of Essential Hypertension"

Dana W. Atchley, M.D., New York

 "Ocular Fundi in Essential Hypertension—Preand Postoperative" Hugh S. McKeown, M.D., New York

t. "Experience with the Surgical Treatment of Hypertension" Reginald Smithwick, M.D., Boston, Massachusetts (By invitation)

> Thursday, May 11-10:00 A.M. Hotel Pennsylvania, Keystone Room

### Symposium

THE TREATMENT OF SPECIAL INFECTIONS

 "The Treatment of Infection with Particular Reference to the Peritoneum" Samuel C. Harvey, M.D., New Haven, Connecticut (By invitation)

 "The Role of Penicillin in the Treatment of the Septic Compound Fracture" George K. Carpenter, Maj., (MC), AUS, Staten Island (By invitation) Karl F. Mech, Capt., (MC), AUS, Staten Island (By invitation)

 "The Prophylaxis and Therapeusis of Clostridial Infections—Gas Gangrene"

Andrew H. Dowdy, M.D., Rochester Robert L. Sewell, M.D., Fort Worth, Texas (By invitation)

Discussion of Symposium: John J. Morton, M.D., Rochester

### Section on UROLOGY

Chairman...A. Laurence Parlow, M.D., Rochester Vice-Chairman...George E. Slotkin, M.D., Buffalo Secretary.....John K. de Vries, M.D., New York

Tuesday, May 9-10:00 A.M. Hotel Pennsylvania, Foyer of Keystone Room

### Symposium

#### RENAL TUMORS

- "Solid Tumors of Renal Parenchyma" Ernest M. Watson, M.D., Buffalo
- "Wilms Tumors" Archie L. Dean, Jr., M.D., New York
- 3. "Tumors of the Adrenal" George F. Cahill, M.D., New York

Discussion of Symposium: Benjamin S. Bar-

3. "Bicipital Tenosynovitis" Robert K. Lippmann, M.D., New York Discussion of "Surgical Aspects" of last two papers opened by David M. Bosworth, M.D., New York Discussion of "Medical Viewpoint" of both papers opened by Otto Steinbrocker, M.D.,

### Thursday, May 11—10:00 A.M. Hotel Pennsylvania, Manhattan Room

Joint Meeting with the Section of Orthopaedic Surgery of the New York

(By invitation) (Program to be announced later in the official Program)

Academy of Medicine

### Section on

### PATHOLOGY AND CLINICAL PATHOLOGY

Chairman.......Ward H. Cook, M.D., Yonkers Vice-Chairman..Fred W. Stewart, M.D., New York Secretary......M. J. Fein, M.D., New York

### Tuesday, May 9-10:00 A.M. Hotel Pennsylvania, Parlor B

- "Medicolegal Systems—Actual and Ideal" Harrison S. Martland, M.D., Newark, New Jersey (By invitation) Discussion: Floyd S. Winslow, M.D., Rochester
  - "Sudden and Unexpected Natural Death" Milton Helpern, M.D., New York Discussion: George M. Mackenzie, M.D.,
  - Cooperstown "Medicolegal Applications of the Rh Blood Types"
  - Alexander S. Weiner, M.D., Brooklyn Discussion: Ernest Witebsky, M.D., Buffalo

### Wednesday, May 10-2:00 P.M. Hotel Pennsylvania, Manhattan Room

Joint Meeting with the Section on Public Health, Hygiene and Sanitation

### Round Table

Wilson G. Smillie, M.D., New York, Chairman

"Amebiasis"

Ralph W. Nauss, M.D., New York (By invitation)

"Schistosomiasis" Henry E. Meleney, M.D., New York

"Epidemiologic Features of Malaria" Morton C. Kahn, M.D., New York (By invita-

tion)

"Intestinal Helminths" Harold W. Brown, M.D., New York (By invitation)

"Dysentery" Albert V. Hardy, M.D., New York (By invitation)

Donald L. Augustine, M.D., Boston, Massachusetts (By invitation)

### Section on PEDIATRICS

Chairman. . A. Clement Silverman, M.D., Syracuse Vice-Chairman. . . . . Carl H. Laws, M.D., Brooklyn Secretary......Albert G. Davis, M.D., Utica

> Tuesday, May 9-10:00 A.M. Hotel Pennsylvania, Manhattan Room

Joint Meeting with the Session on Physical Therapy (See Session on Physical Therapy)

### Wednesday, May 10-2:00 P.M. Hotel Pennsylvania, Parlor 2

- "Two Score Years of Pediatrics"
  T. Wood Clarke, M.D., Utica
  Discussion: Edward J. Wynkoop, M.D., Syra-
- "Practical Experience with Congenital Heart 2. Disease" Hyman Green, M.D., Boston, Massachusetts (By invitation)
- "The Role of Developmental Diagnosis in Clinical Medicine" Arnold Gesell, M.D., New Haven, Connecticut (By invitation) Discussion: Harry Bakwin, M.D., New York

### Section on PUBLIC HEALTH, HYGIENE, AND SANITATION

Chairman . . . . Arthur M. Johnson, M.D., Rochester Vice-Chairman.... Vice-Chairman

Joseph P. Garen, M.D., Saranac Lake
Secretary

Frank E. Coughlin, M.D., Albany

### Tuesday, May 9-10:00 A.M. Hotel Pennsylvania, Parlor 2

"The Place of the Mass Survey in the Tuberculosis Control Program"

Herbert R. Edwards, M.D., New York Discussion: Ezra Bridge, M.D., Rochester; and William Siegal, M.D., Albany

"Indices and Standards for Child Health Services" Myron E. Wegman, M.D., New York (By

invitation) iscussion: William A. Holla, M.D., White Discussion: Plains; and Helen H. Owen, M.D., Altamont

"The Treatment of Early Syphilis with Fever and Mapharsen"

Nathaniel Jones, M.D., Jacksonville, Florida (By invitation)

"Public Health Education in the Control of Venereal Disease" Charles M. Carpenter, M.D., Rochester Discussion of both papers: Theodore Rosenthal, M.D., New York; and Evan W. Thomas, M.D., New York

### Scientific Exhibits

### Hotel Pennsylvania, New York, May 8-11, 1944

J. G. Fred Hiss, M.D., Chairman, Syracuse John DePaul Currence, M.D., New York

Harry Barowsky, M.D. New York Medical College Flower and Fifth Avenue Hospitals New York

GASTROSCOPT

A motion picture in kodachrome, demonstrating the mechanics of examining the interior of the stomach and illustrating the common gastric lesions encountered. From the Department of Medicine, Section of Gastroenterology, New York Medical College. Motion picture.

> Harry B. Biscow, M.D. New York

A SPECIAL GLOVE TO MEASURE THE TRUE CONJUGATE

A rubber glove which has a measure printed on the side of the index finger.

> Virgil S. Counseller, M.D. Mayo Clinic Rochester, Minnesota

Subgical and Postoperative Treatment of Vesicovaginal Fistulas

The exhibit demonstrates graphically the surgical repair of various types of vesicovaginal fistulas. It shows types of vesicovaginal fistulas encountered and the importance of the relative position of the fistulas to the (1) urethral sphincter, (2) ureteral meatus, (3) trigon, (4) fundus, and (5) upper urinary tract is emphasized. Proper postoperative care.

Joshua W. Davies, M.D. Woman's Hospital New York

Colored Life-Size Gynecologic Models Colored wax models of interest to the gynecologist and obstetrician.

> Charles E. Galloway, Maj., (MC), USA Northwestern University Chicago, Illinois

> > CERVICAL PATHOLOGY

Kodachrome pictures in natural color will be used to illustrate all of the various pathologic lesions of the cervix.

Lee A. Hadley, M.D. Syracuse Memorial Hospital Syracuse

X-RAY STUDIES OF THE SPINE

Some interesting congenital, traumatic, and pathologic conditions involving the spine. With ome additional films showing osteomyelitis treated by chemotherapy.

Demonstration of Fresh Pathologic Specimens

Arranged by Milton Helpern, M.D. New York

and a group of New York City pathologists

Benjamin Jablons, M.D.
Jules Cohen, M.D.
City Hospital
and
Goldwater Memorial Hospital
New York

Photoplethysmographic Studies on Cieculation

Charts showing photoplethysmograms obtained by the use of a photoelectric cell and light setup connected with a recording amplifying galvanometer showing peripheral pulse waves in normal persons and in individuals suffering from peripheral vascular disease, shock, hyperthyroidism, and cardiac conditions. Also the effect of vasodilator and vasoconstrictor substances. (Motion pictures)

John J. Moorhead, M.D.

New York Post-Graduate Medical School and
Hospital
New York

### FOREIGN-BODY FINDER

A portable device for localizing metallic foreign bodies, using a thin electromagnetic probe and an indicating meter by means of which metallic foreign bodies may be localized without requiring actual contact. May be used preoperatively as well as during the actual operation.

George H. Ramsey, M.D.
J. Douglas French, M.D.
William H. Strain, Ph.D.
The University of Rochester
School of Medicine and Dentistry
Rochester

### MYELOGRAPHY WITH PANTOPAQUE

A series of photographs and radiographs showing the technic of injecting and removing Pantopaque, a new absorbable liquid contrast medium for myelography. The exhibit will include normal myelograms, radiographs showing absorption of the medium, and a number of myelograms demonstrating typical proved defects.

Ludwig von Sallmann, M.D.
Karl Meyer, M.D.
Columbia University
College of Physicians and Surgeons
New York

Penicillin in Ophthalmology Graphs, drawings, colored photographs, and ringer, M.D., New York; Allister M. McClellan, M.D., New York; and J. Sydney Ritter, M.D., New York

Wednesday, May 10-2:00 P.M. Hotel Pennsylvania, Foyer of Keystone Room

 "Anomalies of the Upper Urinary Tract" John E. Heslin, M.D., Albany William A. Milner, M.D., Albany

- Intubated Ureterotomy"
   David M. Davis, M.D., Philadelphia, Pennsylvania (By invitation)
- "Advanced Carcinoma of the Prostate"
   A. Laurence Parlow, M.D., Rochester

Discussion of papers: Roy B. Henline, M.D., New York; William J. Kennedy, M.D., Gloversville; and John K. de Vries, M.D., New York

### **SESSIONS**

# Session on HISTORY OF MEDICINE

> Wednesday, May 10-4:00 P.M. Hotel Pennsylvania, Conference Room 3

- "The Progress of Medicine in New York City, and the Negro Physician" Gerald A. Spencer, M.D., New York
- "History of Public Health in Cattaraugus, Chautauqua, and Allegany Counties" Henry R. O'Brien, M.D., Charlottesville, Virginia (By invitation)
- "A Brief History of Dermatology in New York City—Its Share in the Progress of the Specialty in America" Paul E. Bechet, M.D., New York

General Discussion

# Session on PHYSICAL THERAPY

Tuesday, May 9--10:00 A.M. Hotel Pennsylvania, Manhattan Room Joint Meeting with the Section on Pediatrics

- "The Poliomyelitis Epidemic in Chicago in 1943"
   Edward L. Compere, M.D., Chicago, Illinois (By invitation)
   Discussion: Philip M. Stimson, M.D., New York; and William Bierman, M.D., New York
- "Good Posture in Children"
   Royal Storrs Haynes, M.D., New York
   Discussion: John R. Cobb, M.D., New York
   and William B. Snow, M.D., New York
- 3. "Treatment of Children with Cerebral Palsy"
  Veronica O'Brien, M.D., New York
  Discussion: Arno D. Gurewitsch, M.D., New
  York
- "The Role of Hydrotherapy in Rehabilitation"
   Hans J. Behrend, M.D., New York
   Discussion: Walter S. McClellan, M.D., Saratoga Springs; and Robert Muller, M.D., New
   York

RHEUMATIC FEVER IN YOUNG PEOPLE

The prevalence and trends of rheumatic fever among those of younger ages; statistical data on factors in the cause and spread of the disease; data on the prognosis of the disease based on the continuous follow-up of nearly 3,000 children after an attack of rheumatic fever.

New York City Department of Health Ernest L. Stebbins, M.D., Commissioner

AIDING THE PHYSICIAN IN VENEREAL DISEASE WORK

Graphic presentation of the practical aids placed at the disposal of the practicing physician by the New York City Department of Health.

Bureau of Child Hygiene New York City Department of Health Leona Baumgartner, M.D., Director

THE SCHOOL HEALTH PROGRAM IN NEW YORK CITY A cooperative effort of teachers, nurses, physicians, and parents.

New York Diabetes Association, Inc.

SUMMER CAMP FOR DIABETIC CHILDREN

The activities at the summer camp for diabetic children, Camp Nyda, conducted by the New York Diabetes Association. Recreational, instructional, and research aspects. (Motion pictures)

New York State Association of School Physicians Michael Levitan, M.D. Rome

School Physicians' Activities

Charts showing various phases and aspects of the school physicians' activities.

Division of Cancer Control New York State Department of Health

Tomor Clinic Organization and Operation
The organization and operation of tumor clinics
is portrayed by means of photographs. The exhibit depicts clearly the personnel necessary for the
proper operation of clinics and shows the benefits
that the staff of the hospital can derive from such
participation. The operation of the clinic is illustrated pictorially, beginning with the referral of the
patient to the clinic, through to the final disposition

of the patient, no matter what type of therapy is used. A map shows locations of clinics in New York State. Aphorisms regarding tumor clinics and statistics supporting the need for additional clinics are presented.

### Division of Communicable Diseases New York State Department of Health

TROPICAL DISEASES OF POSSIBLE IMPORTANCE TO NEW YORK STATE

The exhibit attempts to present the pertinent clinical and epidemiologic facts concerning those tropical ailments which are being seen and will be seen in increasing numbers in our troops and civilians returning from the tropics. Emphasis is placed on those diseases in which there is some possibility that we may see spread of the infection to other residents of the State, malaria being the best example.

### Division of Public Health Education New York State Department of Health

PREVENTION OF ACCIDENTS

This exhibit depicts some of the most frequent causes of accidents in a home and on the farm. It gives definite information as to the prevention of such accidents.

New York State Department of Education Maude E. Nesbit, Medical Librarian New York State Medical Library

POSTERS, BOOKS, AND JOURNALS

A representative of the Library will be present to answer all questions concerning the services of the Library. The New York State Medical Library cordially urges all of the members of the Medical Society of the State of New York to use their Library in the Education Building, Albany. There are more than 51,000 volumes in the Medical Library, and over 500 periodicals are received currently. Special books are sent to the borrower on request, or selected literature on a given subject will be sent if requested. This service is extended, without charge, to physicians registered in New York State. The only obligation imposed on the borrower is the payment of the transportation charges both ways.

New York State Department of Labor Division of Industrial Hygiene Leonard Greenburg, M.D. New York

ACTIVITIES OF THE DIVISION OF INDUSTRIAL HYGIENE THE OF NEW YORK STATE DEPARTMENT OF LABOR

This exhibit outlines the medical, chemical engineering, and educational activities of the Division of Industrial Hygiene in the prevention of occupational disease in New York State. (Motion pictures)

New York State Commission for the Blind Ruth B. McCoy Alva Trotter

This exhibit stresses early diagnosis of glaucoma by picturing a fundus of an eye affected with acute glaucoma and a diagram of fields of vision in a normal eye.

other descriptive matter cover the small-scale production of penicillin, its penetration into the eye in local and systemic application, and the comparative effect of penicillin therapy and sulfonamide treatment in experimental intraocular infections with staphylococcus, pneumococcus, and Clostridium welchii. Also illustrated are studies on the treatment of experimental infections of the vitreous humor.

National Research Foundation for the Eugenic Alleviation of Sterility Frances I. Seymour, M.D. New York

### ARTIFICIAL INSEMINATION

The exhibit demonstrates the aims for the use of artificial insemination, its national economic importance, the medical indications for its use, suggested method for successful results, and the commonest pitfalls and reasons for failure. (Motion

> Henry K. Taylor, M.D. Teresa McGovern, M.D. Goldwater Memorial Hospital New York

### CARDIOANGIOGRAPHY

Films demonstrating the anatomy of the heart and large blood vessels, in health and disease, made in the living with 70 per cent diodrast.

> Abner I. Weisman, M.D. Jewish Memorial Hospital New York

A CLINICAL EVALUATION OF THE PROBLEM OF HUMAN STERILITY

Charts and graphs illustrating the causes of barren marriages, the diagnostic measures utilized, the results obtained, and the future needs of the physician handling such problems. One of the most interesting phases of this study is the revelation that the male is probably more frequently responsible for barrenness than is the female partner. (Motion pictures showing a new technic in uterotubal x-rays in the diagnosis of female sterility)

> Morton I. Berson, M.D. Downtown Hospital Pan-American Clinic New York

SURGICAL REPAIR OF TRAUMATIC DEFORMITIES

1. The use of cartilage grafts in reconstructing old depressed fractures of the frontal, maxillary,

malar, and nasal bones.

2. Full-thickness grafts, split-skin grafts, and pedicle flaps used in reconstructing facial scars and

contractures of extremities.

3. A new two-stage operation using free-skin grafts and autogenous costal cartilage grafts in building up an external ear.

The use of derma-fat-and-fascia grafts in building up depressions due to loss of soft tissues. (Motion pictures)

> Jacob Daley, M.D. New York

THE ROLE OF PLASTIC SURGERY IN OTOLARYNGOLOGY

Maxillofacial injury. Models showing reduction of molar-zygomatic fracture.

2. Traumatic septum. Models showing the effect on the physiology of the nose and methods of correction.

3. Models demonstrating alteration in air currents in nasal chambers, associated with nasal de-

4. Diagrammatic representation of the "typical rhinoplasty." Models illustrating the steps in the operation.

5. Analysis of deformities of the external nose.

Casts and photoanalysis.

6. Wet specimens demonstrating the anatomy of the nose.

7. Animated movies showing the "typical rhino-plasty" step by step.

8. Selectroslide showing details in technic of a "typical rhinoplasty."

A method to retain a correct septolabial angle following the elevation of the nasal tip in a rhinoplasty.

(Motion pictures)

Tibor de Cholnoky, M.D. Columbia University

New York Post-Graduate Medical School and Hospital New York

RECONSTRUCTIVE SURGERY IN CANCER

Illustrating reconstruction, repair, and plastic surgery of defects after radical operation for facial cancer. (Motion pictures)

> William E. Howes, M.D. Gregory L. Robillard, M.D. Alfred L. Shapiro, M.D. Brooklyn Cancer Institute Brooklyn

SALVAGE THERAPY IN ADVANCED CANCER

Presentation of a series of recurrent and advanced cancer cases treated surgically or radiologically in which cures or significant prolongation of life have been achieved.

### Samuel L. Scher, M.D.

### New York

### PLASTIC SURGERY

All categories in maxillofacial and plastic reparative surgery; plastic repair of (1) depressions and hemangioma of the eranium; (2) coloboma, ptosis, and ectropion of the eyelids; (3) all injuries and typical deformities of the nose; (4) different types of the plate and typical deformities of the nose; (4) different types of the plate and typical deformities of the ship cleft palate and harelip; (5) deformities of the chin and mandible, both prognathism and microgenia; (6) scars, burns, contractures, and depressions; (7) hypertrophied breast; (8) traumatic injury to the fingers (Dupuytren's contraction); (9) skin grafting, use of free-skin grafts and pedicle grafts (Padgett dermatome); (10) methods of suturing various wounds; (11) uses of refrigerated human cartilage; (12) new of the face. (12) nevi of the face.

The New York City Cancer Committee of the American Society for the Control of Cancer

THIRTY-YEAR EXHIBIT

Reviews of the activities of the American Society for the Control of Cancer during the thirty years of its existence.

### Technical Exhibits

### Hotel Pennsylvania, Ballroom Floor

A NOTHER "War Medicine" meeting finds the technical exhibits a great panorama of the latest in pharmaceuticals, medical books, nutritional products, instruments, and technics. More than ever before the physician will find in these exhibits a wealth of practical information and a wide variety of useful products to help him maintain the health of Americans at home, in industry, and the armed services. Following are brief descriptive items in alphabetical order giving a preview of the exhibits.

Abbott Laboratories, North Chicago (Booth 29).

A hearty welcome awaits you here, So in this booth be stepping To chat with Abbott men sincere Your knowledge to be pepping, On Pentothal and sulfa drugs, On vitamins and pollens, On Metaphens for killing bugs In ampules and in gallons.

Moral: Be sure to stop at 29

To view first hand the Abbott line.

The Alkalol Company, Taunton, Massachusetts (Booth 20), manufactures two famous preparations: Alkalol—a scientifically balanced alkaline, saline solution containing no glycerine and barely a trace of alcohol. It is hypotonic and a mucus solvent. Irrigol—an alkaline, saline douche powder which

makes a nontoxic, slightly astringent solution, useful as a vaginal douche, rectal enema, and for colonic irrigations.

American Hospital Supply Corporation, Chicago (Booth 4). Baxter Intravenous Solutions and blood, plasma, and serum equipment will be a feature of the American Hospital Supply Corporation's booth. Solutions in the famous Baxter Vacoliter will be displayed, along with such transfusion equipment as Transfuso-Vacs, Plasma-Vacs, and Centri-Vacs.

Trained staff members will be in attendance to explain and answer questions on all phases of the Baxter Intravenous Technic. Also on display will be many specialty items of importance to better hospital routine and service.

American Lecithin Company, Inc., Elmhurst, Long Island, New York (Booth 64), manufacturers and distributors of soybean lecithin products, will exhibit Lexco Wafers and other lecithin products. A seneral review will be presented of the use of these products in the treatment of psoriasis and other disorders of the fat metabolism. Bulletins, literature excerpts, reprints, and free samples will be distributed.

American Safety Razor Corp., Brooklyn, New York (Booth 75).

The Arlington Chemical Company, Yonkers, New York (Booth 108). Three valuable therapeutic agents are being featured by the Arlington Chemical Company: Aminoids, a protein hydrolyzate containing amino acids derived from beef, wheat, milk, and yeast, for treatment of protein deficiencies; and Arl-Cu-Fer and Pro-Cu-Fer, two new hematinics for the treatment of iron deficiency anemias.

The Armour Laboratories, Chicago (Booths 26 and 27), feature an interesting clinical display of thyroid deficiencies by means of wax models. The new Armour book, The Thyroid Gland and Clinical Application of Medicinal Thyroid, is available to members of the New York State Medical Society who visit this exhibit.

W. A. Baum Co. Inc., New York (Booth 41), will have on display all of the latest models of the Baumanometer—the New Kompak, the 300, the Wall, and the Standby. An invitation is extended to the doctors in attendance to bring in their Baumanometer for checking, minor repairs, and replacements.

Becton, Dickinson & Co., Rutherford, New Jersey (Booth 38), will feature a full line of Yale-Luer-Lok syringes and a new outfit for introducing continuous caudal analgesia. This outfit includes the new needle as suggested and used by Drs. Hingson and Edwards of the U.S. Marine Hospital on Staten Island.

The Best Foods, Inc., New York (Booth 39), is exhibiting and sampling Nucoa, the wholesome, nutritious vegetable margarine, which contains over 9,000 units of vitamin A to the pound. Highlighted, also, are the fine flavor and texture of Nucoa and the increasingly important place of vitaminized margarine in the National Nutrition Program. Miss Elsie Stark, Director of Consumer Education, will be in charge of the booth.

Bilhuber-Knoll Corp., Orange, New Jersey (Booth 101). Our "Council Accepted" medicinal chemicals find an important place in wartime medicine because of their proved effectiveness and dependability. Metrazol—respiratory and circulatory restorative; Theocalcin—di-

uretic and myocardial stimulant; and Dilaudid—

National Society for the Prevention of Blindness Committee on Glaucoma Mark J. Schoenberg, M.D., Chairman

New York GLAUCOMA

Presenting charts denoting frequency of glaucoma, together with pathologic and diagnostic aspects of the disease.

Tonometer checking procedures will be included.

National Gastroenterological Association Anthony Bassler, M.D., President New York

AMEBIASIS AND ITS TREATMENT Photographs and motion pictures.

National Hospital for Speech Disorders James S. Greene, M.D. New York

TREATMENT OF VOICE AND SPEECH DISORDERS AT THE NATIONAL HOSPITAL FOR SPEECH DISORDERS

Photographs illustrating admission procedures and diagnostic and therapeutic measures; also pathologic conditions associated with various voice and speech defects. Recordings demonstrating these various voice and speech defects will be played.

National Tuberculosis Association Charles E. Lyght, M.D. Northfield, Minnesota

Mass Chest X-Raying
"X-ray finds tuberculosis early—listening finds it

late." The exhibit contrasts for the doctor the good results of using the x-ray and the eye as compared with the poor ones when only the ear and the stethoscope are relied upon. Four useful x-ray screening methods are shown, as well as typical early and advanced lesions.

"Two Roads to the Family Physician"—the fast Road that leads industrial survey cases and contacts through the x-ray room straight to the doctor's office, and the slow Road that meanders through delay, early symptoms, quack remedies, and more delay, perhaps leading to the physician—but too latel

War Manpower Commission

New York State Procurement and Assignment
Service

Joe R. Clemmons, M.D., Chairman

PROCUREMENT AND ASSIGNMENT SERVICE FOR PHYSICIANS

Dr. Clemmons or his associates will be present to discuss problems of progurement and assignment of physicians during the present emergency.

Halloran General Hospital

R. C. De Voe, Col., (MC), USA Commanding Officer

The setup of the Halloran General Hospital will be presented. Standardized procedures will be discussed. The importance of certain directives relative to surgical management of various injuries and other surgical conditions will be explained.

# RCA INVITES

# YOU

to see the new model

### RCA ELECTRON MICROSCOPE

which will be on exhibition at Room 621

Hotel Pennsylvania, New York

May 8-11

All persons attending the Annual Meeting of the Medical Society of the State of New York will be especially welcome at this exhibit.

An RCA representative will demonstrate and explain the instrument, its powers and operation, and will answer your questions.

If you cannot be present at this exhibit, your inquiries should be addressed to Electron Microscope Section, Radio Corporation of America, Camden, N. J.

### RADIO CORPORATION OF AMERICA

RCA VICTOR DIVISION · CAMDEN, N. J.

Leads the Way . . In Radio, Television, Tubes, Phonographs, Records, Electronics

analgesic and cough sedative, are receiving increased use by the armed forces, by other government agencies, and in civilian practice.

Ernst Bischoff Company, Inc., Ivoryton, Connecticut (Booth 90), will exhibit Lobelin-Bischoff respiratory stimulant; Sas-Par, effective in the psoriasis; of Anayodin. amebacide; Diatussin, established antispasmodic: Viscysate, hypertensive. Also introducing to the medical profession Aquinone-Bischoff, a watersoluble preparation of menadione itself, in ampules and tablets.

The Borden Company, New York (Booth 111). Borden's distinctive formula foods, scientifically designed for infants, are on display at Booth 111. Visit us there to see our complete line-Biolac, Dryco, Mull-Soy, Beta Lactose, Klim, and Merrell-Soule Powdered Milks.

Brewer & Company, Inc., Worcester, Massachusetts (Booth 96), will feature a line of ampules. Among the items in this group will be shown our new Ether-in-Oil, used in the treatment of bronchial asthma. Another product is our vitamin D ampule of 400,000 units, called Hi-Deratol, which many physicians are using to supplement their medication in the treatment of calcium and phosphorus metabolism upsets. Incidentally, Hi-Deratol ampules are noted for their high potency of vitamin D. Our representatives will be glad to discuss with physicians the merits of other Brewer products, such as Thesodate, Luasmin, EnKIde, etc.

Well-Burroughs come & Co., Inc., New York (Booth 115), presents a representative group of fine chemicals and pharmaceutic preparations, together with new and important therapeutic agents of special interest to the medical profession.

Cambridge Instrument Company, Inc., New York (Booth 78). The invaluable help which electrocardiograms provide for physicians in military, industrial, and civilian practice makes the Cambridge Instrument Company exhibit of cardiac diagnostic instruments particularly timely. They will feature, as part of a complete exhibit of cardiac diagnostic instruments, the compact, lightweight, portable "Simpli-Trol" model Electrocardiograph-Stethograph that produces electrocardiogram and stetho-gram separately or simultaneously. Cambridge Electrocardiographs for large or small hospital, research laboratory, clinic, or private office will also be demonstrated.

Camel Cigarettes, New York (Booths 31 and 32). will exhibit large detailed photographs of equipment used in comparative tests of the five largest-selling brands of cigarettes. Dramatic visualization of nicotine absorption in the human respiratory tract from cigarette smoke will be demonstrated. International news with the Camel Cigarette Trans-Lux "Flash Bulletins" may be seen while you enjoy a supply of slow-burning Camel Cigarettes.

The Cameron Heartometer Company, Chicago and New York (Booth 12), is showing the improved Heartometer, a scientific precision instrument for accurately recording systolic and diastolic blood pressures. It also furnishes a permanent graphic record of the pulse rate, the nervous functioning of the heart, and the myocardial strength, as well as the functioning of the valves. The Heartometer clearly reveals heart disturbances in both early and advanced stages and is of great value in checking the progress of medication and treatments.

Cameron Surgical Specialty Company, Chicago and New York (Booth 89). See the Cameron Flexible Gastroscopes and Cavi-camera, the new Rosi Coagulo-Sigmoidoscope, Bronchoscopes, Esophagoscopes, Laryngoscopes, Binocular Prism Loupe, Mirrolite, Color Flash Clinical Camera, Magniscope, and other new developments in electrically lighted diagnostic and operating instruments. Electrosurgical units will also be on display. New York Sales Agent, 250 West 57th Street, New York City, convenient for service at all times for doctors in the Greater New York area.

S. H. Camp & Company, Jackson, Michigan (Booth 119), will display a complete line of Camp Anatomical Supports for prenatal, postnatal, visceroptosis, sacro-iliac, hernia, and other specific conditions. Experts from the Camp staff will be in attendance to answer questions pertaining to the scientific application of these supports and to advise regarding the availability of them in authorized service departments of stores throughout the country.

Canadian Radium & Uranium Corporation, New York (Booth 17). A visit to this exhibit will remind medical men that all needs for radium in the Western Hemisphere can now be supplied wholly within this Hemisphere. High-purity radium is available to the medical profession in any form and any type of container. A special exhibit is devoted to the new Alpha Ray Therapy by utilization of Radon in ointment. For further interesting details, call at Booth 17.

Carbisulphoil Company, Dallas, Texas (Booth 86) manufacturers of Foille, an antiseptic, analgesic emulsion indicated in the field of burns and wounds. Foille treats a burn as a wound, effecting almost immediately a marked control of pain and materially mitigating first shock. The formation of a soft coagulum over denuded areas, in contrast to a tough, tannic acid eschar, permits needed suppuration and drainage when required; free mobility of joint creases and extremities is afforded to reduce contracting scars. Distributed through wholesale druggists and surgical supply and first-aid houses.

Carnation Company, Oconomowoc, Wisconsin (Booth 116). You are invited to visit the Carnation Company's booth, where you will see an unusual reproduction of the Carnation Milk Farm and find presented some interesting information on the various uses of Irradiated Carnation Milk for infant feeding, child feeding, and general diet purposes.

Valuable literature will be available for distribution.

[Continued on page 800]

# Diethylstilbestrol

CHEPLIN'S DIETHYLSTILBESTROL is the most potent of the stilbene compounds described up to the present time and its physiologic activity duplicates practically all the known actions of the natural estrogens.

DIETHYLSTILBESTROL is indicated

for estrogenic therapy in menopausal symptoms, senile vaginitis, kraurosis vulvae and gonorrheal vaginitis of children. Also suppresses painful engorgement of the breasts in the puerperium and inhibits lactation under certain conditions. Literature on request.

### DIETHYLSTILBESTROL

supplied for intramuscular use in ampules of 1 cc. containing:

0.2 mg. 0.5 mg. 1.0 mg. 2.0 mg. 5.0 mg.	}	in boxes of 6, 12, 25 & 100

in vials of 30 cc. containing 0.5 mg. per cc.

# CHEPLIN BIOLOGICAL LABORATORIES, INC.

(Division of Bristal-Myers)
Syracuse, New York

[Continued from page 798]

Chatham Pharmaceuticals, Inc., Newark, New Jersey (Booth 3). Koagamin, a safe, reliable, inexpensive, and rapidly effective hemostatic for parenteral use in capillary and venous bleedings, will be shown and full information and literature will be available. Also Aluminoid Capsules, the easy-to-take, easy-to-carry, and less constipating form of aluminum hydroxide, will be available in sample form, and a demonstration of its great dispersion and prolonged suspension will be made.

Ciba Pharmaceutical Products, Inc., Summit, New Jersey (Booth 55). Physicians are cordially invited to visit Booth 55, where a Ciba representative will answer questions regarding our specialties and discuss in de-

tail our newest preparations: Privine Hydrochloride, a powerful nasal vasoconstrictor with a prolonged action; and Metandren Linguets, newest form of Metandren, most potent androgen available for oral use.

The Coca-Cola Company, Atlanta, Georgia (Booth 28), is planning to and hopes to be able to serve ice-cold Coca-Cola to the delegates with our compliments during the convention.

The Cream of Wheat Corporation, Minneapolis, Minnesota (Booth 68), will display both "Enriched 5-Minute" and "Regular" Cream of Wheat. "Zingl," stabilized wheat germ, will also be available for inspection. It is an economical, high vitamin germ that has been specially stablized to prevent rancidity.

The Denver Chemical Mfg. Co., New York (Booth 109), will exhibit Galatest, the dry reagent for the instantaneous detection of urine sugar, and Acetone Test (Denco), a dry reagent for the instantaneous detection of acetone in urine. These products, both simple, accurate, speedy, and economical, are being employed more extensively daily by hospitals, institutions, and private practitioners throughout the country.

Devereux Schools, Devon, Pennsylvania (Booth 23). Representatives at the booth will be glad to answer all questions regarding Devereux Schools, the eleven widely separated units which offer facilities for boys and girls who find it difficult to make an adequate social or scholastic adjustment in regular schools.

Doak Company, Cleveland, Ohio (Booth 18). Ampule Medication: Colloidal bismuth, calcium, iron, and sulfur. Dermatologic Preparations: For the treatment of acne, eczema, seborrhea, mycosis, and psoriasis. Prevention of contact dermatitis. Please call and register.

The Doho Chemical Corporation, New York (Booth 1), will feature an animated pathologic ear exhibit. The auralgan exhibit consists of a model of the human auricle four feet high, together with a series of twenty-four three-dimensional ear drums, modeled under the supervision of outstanding otologists.

Each of these drums depicts a different pathologic condition based upon actual case observation and has been prepared, in so far as possible, with strict scientific accuracy so as to be highly instructive and interesting to all physicians.

Effervescent Products, Incorporated, Elkhart, Indiana (Booth 94), will give a demonstration of urine sugar analysis by the new Clinitest Tablet Method—simple, reliable, fast, single tests made in less than one minute; a sensitive qualitative test giving dependable quantitative estimations up to 2 per cent. The Clinitest Tablet Method is a copper reduction one. The tablets generate their own heat; therefore neither gas nor alcohol flame is required.

Endo Products, Inc., Richmond Hill, New York (Booth 37), manufacturers of pharmaceutic specialties and pioneers in the development of medications for ampule use, presents an interesting exhibit. Among the products exhibited are Hycodan, a new antitussive with demonstrable advantages over codeine, to which it is chemically related; Triketol, a specially processed bile-acids preparation, and Endoglobin Tablets, a recently released hematinic.

Fairchild Bros. and Foster, New York (Booth 6).

C. B. Fleet Co., Inc., Lynchburg, Virginia (Booth 15). The medical profession is cordially invited to visit Booth 15, which displays Phospho-Soda (Fleet), the buffer saline eliminant. Particular emphasis is given to the use of Phospho-Soda (Fleet) in wartime industrial medicine and also to its use in the military and public health service. Our representatives from your district will greet you.

General Electric X-ray Corp., Chicago (Booth 56). Although working around the clock to meet production schedules essential to the war effort, the General Electric X-ray Corporation is not unmindful of the need for expert maintenance service by owners of x-ray and other electromedical equipment. G. E.'s Periodical Inspection and Adjustment Service continues to function, now as in the prewar years, through branch offices and regional service depots throughout the country. Stop in at the G. E. exhibit for further information on "P. I. and A." Service. At the same time you can obtain interesting facts about the use of photoroentgenography in mass x-ray chest surveys and see a demonstration of the G-E Orthostereoscope, for viewing stereoscopic 4- by 5-inch chest photoroentgenograms.

Gerber Products Company, Fremont, Michigan (Booth 36). Gerber's Cereal Food and Strained Oatmeal are enriched and precooked. We invite your inspection of the literature and the display of the Gerber Foods.

Otis E. Glidden & Co., Evanston, Illinois (Booth 98). You are cordially invited to visit ZymenoL Booth

[Continued on page 802]

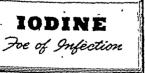

## Efficiency of Iodine

\* Iodine long has been an outstanding germicide for preoperative use, for wound therapy, and for sterilization of common cuts, scrapes and scratches. It is so thoroughly accepted that its high efficiency is, perhaps, only casually appreciated by surgeons and physicians overworked by present day demands.

lodine has been clinically demonstrated to be non-irritating when properly applied. It is customarily used in dilutions of 7%, 31/2% or 2% but dilutions as low as 1% have been shown to be effective in preventing infection.

Iodine has particular power to enter the skin follicles and is effective in the presence of natural barriers of the skin itself. It is bactericidal in concentrations which are not toxic to the tissues.

Iodine Educational Bureau, Inc. 120 Broadway, New York 5, N. Y.

# REVOLUTIONARY

### MOULDED TO THE INDIVIDUAL REQUIREMENTS OF EACH FOOT

The plastic arch built into Conformal shoe has revolutionized corrective shoe fitting. It eliminates guess work, assures absolutely accurate relief from strain in even the most acute cases. The best endorsement of Conformal shoes is that men and women leaders in the medical profession wear as well as prescribe them. Recommend Conformal shoes with utmost confidence-ideal for prenatal care. Your prescriptions faithfully followed by experienced fitters at:

98. Obtain the latest information on ZymenoL, the brewers' yeast emulsion that provides a twofold natural therapy, equally effective in either the irritable, unstable, or stagnant bowel without catharsis, artificial bulkage, or large doses of mineral oil.

The Gradwohl Laboratories, St. Louis, Missouri (Booth 87), will display facts regarding their full laboratory service, viz.: (1) school for the training of laboratory technicians; (2) full line of laboratory reagents; (3) a monthly periodical called the Laboratory Digest—a journal of current laboratory literature carefully and critically compiled; (4) a laboratory reference book—Clinical Laboratory Methods and Diagnosis, third edition, two volumes (Mosby, publisher). This is a standard laboratory guidance book published about every five years. Special attention is given in the display to grouping serums—anti-A, anti-B, absorbed B (to differentiate A<sub>1</sub> from A<sub>2</sub> bloods), anti-M, anti-N, and anti-Rh. This organization aims to provide physicians and laboratories with every possible aid in solving their laboratory problems.

Grant Chemical Co., Inc., New York (Booth 65), are well known as makers of "Specialties for Diseases of the Heart and Blood Pressure." Every type of cardiovascular therapeutic medication is included in the Grant list of products, old standbys such as aminophylline, caffein sodium benzoate, and camphor in oil through such Grant specialties as Diurbital, Digicotin, and Pancreatic Hormone (Grant). Grant invites physicians to visit Booth 65, which will feature Diurbital for the hypertensive cardiac patient. Samples and literature will be available.

Hanovia Chemical and Manufacturing Company, Newark, New Jersey (Booth 2). Ultraviolet filter jacketed Safe-T-Aire lamps for the destruction of micro-organisms in the air will be a feature of our exhibit. A complete line of new model self-lighting lamps for orificial and body irradiation will be on display. Courteous representatives at your service.

Charles C. Haskell & Co., Inc., Richmond, Virginia (Booth 113).

H. J. Heinz Company, Pittsburgh, Pennsylvania (Booth 16), wishes to acquaint you with the eleventh edition of Nutritional Chart, Nutritional Observatory, and Special Dietary Foods Book. Special feature—Your Baby's Diary and Calendar. Physicians practicing pediatrics and those prescribing soft diets will be especially interested in Heinz Strained and Junior Foods and our new Pre-Cooked Cereal Food.

Hoffmann-La Roche, Inc., Nutley, New Jersey (Booth 112). Pharmaceutic prescription specialties of rare quality, produced at Roche Park, where vitamins are made by the ton, will be exhibited. Syntropan, the antispasmotic that is replacing belladonna, will be a featured product. The medical profession's interest in the many uses of the versatile Prostigmin and other scientific accomplishments will be satisfied by Hoffmann-La Roche representatives who will be in attendance to discuss clinical problems.

Holland-Rantos Company, Inc., New York (Booth 107). (1) The universally known Koromex contraceptive specialties will be on display, including the new Koromex Set Complete, a combination package ideally suited for either prescription or dispensing purposes. (2) The latest in nonallergic pillow cases and mattress covers will be shown along with a complete line of waterproof protective garments and beddings. (3) Be sure to ask our representative about Tincture Nylmerate, a patent germicide for preoperative skin treatment and first aid prophylaxis. (4) Samples of Rantex Masks, the ideal substitute for gauze masks, may be had for the asking.

Hollister-Stier Laboratories, Wilkinsburg, Pennsylvania (Booth 21), specialize in personalized allergy service. A visit to this booth will provide you with a pollen survey for your area and full information on their complete service in allergy. On view are enlarged, colored natural photographs of many plants that cause hay fever. Competent company representatives will welcome you and supply information.

Horlick's Malted Milk Corporation, Racine, Wisconsin (Booth 5), is exhibiting Horlick's Malted Milk, in both natural and chocolate flavors, powder, and tablets. Members of the profession are especially invited to enjoy a delicious drink of Horlick's Malted Milk fortified with vitamins A, B<sub>1</sub>, D, and G. Our representatives will be glad to answer any inquiries and explain the qualities of our products.

Hynson, Westcott & Dunning, Baltimore, Maryland (Booth 95), will have an exhibit featuring Mercurochrome, Thantis Lozenges, Sterile Shaker Packages of Sulfanilamide, which the company developed primarily for military use, and various pharmaceutic specialties of their manufacture. There will also be a display of diagnostic apparatus and ampule solutions which have been worked out in their laboratories in cooperation with physicians. Competent representatives will be in attendance to demonstrate and to provide information regarding these products. Literature will be available to physicians who are not already familiar with the products exhibited.

International Vitamin Corporation, New York (Booth 13), cordially invites all attending physicians to stop at their booth and get acquainted. I.V.C., one of the leading ethical vitamin concerns in the country, is presenting up-to-the-minute developments in the B complex vitamin group. This is accomplished with the nid of continuous, colorful, and informative charts and illustrations. Physicians will be made welcome at the I.V.C. booth by well-informed representatives.

Jones Metabolism Equipment Co., New York-(Booth 85), invites you to see the original wateubss: metabolism apparatus. The exclusive features of the Jones include a double slope tracing which eliminates the possibility of technical errors, a simplified and accurate slide rule for calculations, and a lifetime guarantee for accuracy greater than 99 per cent. The twenty-three years of experience-

Chloride depletion, astringent action, and the resultant undesirable constipation which beset so many other antacids are absent from Magmasil therapy. Hence patient cooperation is assured and rapid clinical results ensue in peptic ulcer, gastritis, hyperchlorhydria.

Magmasil, a palatable, stable aqueous suspension of hydrated magnesium trisilicate, neutralizes 86 cc. of N/10 HCl per teaspoonful. This action is exerted over fully four hours, permitting of fewer administrations, simplifying treatment.

Because of this prolonged action, the 11:00 p.m. dose usually enables the patient to sleep comfortably through the night.

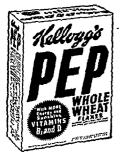

Magmasil therapy permits of early liberalization of the diet, a feature much appreciated by the patient, and leads to rapid healing and remission.

Physicians are invited to send for samples and a complimentary copy of the brochure "Twenty Years of Progress in Ulcer Therapy."

### [Continued from page 802]

of the Jones Metabolism Equipment Company have made it possible for them to produce a foolproof, simple, and accurate machine. Ask to see "Windar."

Kellogg Company, Battle Creek, Michigan (Booth 61). Kellogg's cereals are either whole grain, natural, restored, or fortified. Kellogg's Pep is fortified with additional vitamins B<sub>1</sub> and D. One serving (1 ounce) furnishes one-fourth the minimum daily requirement for adults for thiamin, and sufficient vitamin D to meet all daily requirements for that vitamin. Corn Flakes and Rice Krispies, con-

tributing whole grain values of thiamin, niacin, and iron, may be included freely in wheat-free and low residue diets.

Charles B. Knox Gelatine Co., Inc., Johnstown, New York (Booth 34). Our exhibit will feature the medical and dietary uses of Knox Plain Sparkling Gelatine. Attendants in the booth will gladly discuss the protein value of gelatine and explain how the production and laboratory control makes Knox Gelatine. a quality product essential for special dietary use. Literature, including dietaries and recipes, is free.

Lederle Laboratories, Inc., New York (Booth 48), will feature Child Health Immunization products, penicillin, and sulfadiazine. The same husky baby who is to be featured all over the country in the Lederle Spring Child Health Immunization campaign will be spotlighted in the bull's-eye circular panel. Color transparencies of the new Lederle Penicillin Building at Lederle Laboratories in Pearl River, together with progressive pictures of penicillin molds, will illustrate one side panel. The other panel—on sulfadiazine—will be similarly illustrated with color transparencies. Lederle's staff representatives will be present to answer questions and supply literature and samples on Lederle products—their complete line of vitamins and Cerevim, as well as the featured products mentioned above.

Libby, McNeill & Libby, Chicago (Booth 11). Libby's strained and homogenized baby foods are featured at the Libby booth. Physicians are invited to stop and discuss new findings on the greater availability of iron and the ease of digestion of Libby's Council-accepted foods for babies.

Liberty Vitamin Corp., New York (Booth 65), supplies one of the most comprehensive lists of standard and specialty vitamin preparations in the country. Booth 65 will feature Liberty's Provimin, which provides high potencies of eight vitamins, and eight minerals, as well as Deacin for arthritis, which combines the therapeutic usefulness of massive potencies of vitamin D (Whittier Process) and vitamin C, an essential for the integrity of connective tissues. Literature and samples of Provimin and Deacin will be supplied.

The Lievel-Flarsheim Company, Cincinnati, Ohio (Booth 79), will display the world-famous Hypertherm for artificial fever therapy and Bovie Units for major and minor electrosurgery. You are invited to stop and talk to experienced and qualified representatives who will be happy to discuss the modern applications of medical electronics.

Eli Lilly and Company, Indianapolis, Indiana (Booth 120), will feature an anatomic model illustrating the technics of caudal and spinal anesthesia. Lilly products will be on display, and medical service representatives will be present to assist visiting physicians in every possible way.

J. B. Lippincott Company, Philadelphia (Booth 45), headlining a new one-volume War Edition of Thorek's Modern Surgical Technic! Of the many outstanding Lippincott books displayed, be sure to see those on such timely subjects as syphilology, industrial health, proctology, skin grafting of burns, dermatology, surgery of the ambulatory patient, surgical errors and safeguards, and roentgen diagnosis.

Loeser Laboratory, Incorporated, New York (Booth 42). Specializing exclusively in the manufacture of parenterally applied medication, the name "Loeser" is a guarantee of accuracy, sterility, therapeutic potency, and freedom from pyrogens. An extensive group of fine ampules will be on display at the Loeser exhibit.

The Maltine Company, New York (Booth 118), is exhibiting the old as well as the new. Such fine products as Maltine with Cod Liver Oil, Malto-Yerbine, and Neoferrum have enjoyed favorable recognition for many years. They have been joined by Tedral, Proloid, Depancol, Jeciron B, and other developments of The Maltine Company's research laboratories. A cordial invitation is extended to you to visit Booth 118, where descriptive literature and samples are available.

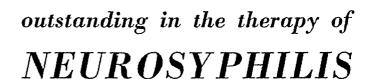

T. H. McKenna, Inc., New York (Booths 43 and 44), are displaying the more recent and representative books of all major publishers. This affords an unusual opportunity to examine all new books, compare competitive to your needs.

courteous, impartial attention. Books of an publishers may be purchased on one account. Monthly payments may be arranged if desired.

McNeil Laboratories, Philadelphia (Booth 104). Members and guests of the Medical Society of the State of New York are cordially invited to visit Booth 104. A number of products that are of particular interest to physicians, such as Digitalis Duo-test and Thyroid Duo-sayed will be shown. Trained representatives will be present to describe the outstanding characteristics of these and other McNeil pharmaceuticals to members of the medical profession.

Mead Johnson & Company, Evansville, Indiana (Booth 57). "Servamus Fidem" means "We Are Keeping the Faith." Almost every physician thinks of Mead Johnson & Company as the maker of

[Continued on page 806]

Among the several therapeutic agents which have proved to be of value in the treatment of neurosyphilis, Tryparsamide Merck has been of outstanding service. Its use in conjunction with artificial hyperpyrexia affords a relatively high incidence of clinical and serologic remissions in cases of early dementia paralytica.

Tryparsamide Merck also has proved of value in the treatment of tabes dorsalis and meningovascular syphilis. It is economical for the patient, is easily administered, and has the advantages. if used alone, of not requiring hospitalization or change in the patient's daily routine. Furthermore, Tryparsamide Merck is available to the patient through the services of his physician.

Tryparsamide Merck is supplied in boxes of 5 ampuls, in three strengths: 1 Gm., 2 Gm., and 3 Gm. each; also in 50 Gm. bottles.

Illustrated brochure, Chemotherapy of Neurosyphilis, sent on request.

# TRYPARSAMIDE MERCK

Dextri-Maltos, Pablum, Oleum Percomorphum, and other infant diet materials-including the new pre-cooked oatmeal cereal, Pabena. But not all physicians are aware of the many helpful services this progressive company offers physicians. A visit to Booth 57 will be time well spent.

Medical Film Guild, New York (Booths A and B). emphasizes its talking papers in this year's program of "Medical Films That Teach." Hospital and medical society program chairmen, now faced with depleted staffs because of the war emergency, who desire educational material for their meetings, find that Medical Film Guild's motion picture film-textbooks answer that important problem. Through grants for postgraduate instruction, these films are available at no charge to any hospital or medical society meeting and to the medical services connected with the armed forces of the United States. Exhibition is also included at no charge under this Exhibition is also included at no charge under this plan. Some of the available films are: "Inguinal Hernioplasty," "Asphyxia Neonatorum, "Nonoperative Treatment of Paranasal Sinusitis," "Otitis Media in Pediatrics," "A Clinic on Acute Mastoiditis," "Otoscopy in the Inflammations," "A Clinic on Sigmoid Sinus Thrombosis," "Pharmacology of Respiratory Stimulants," "Sutures Since Lister," "Amebiasis and its Treatment," and "A Clinic on Otitic Purulencies."

Merck & Co., Inc., Rahway, New Jersey (Booth 58). Physicians attending the Annual Meeting of the New York State Medical Society are cordially invited to visit the Merck booth. Literature will be available on Merck Medicinal Specialties and also on penicillin, the vitamins, and the sulfonamides. If you are interested in an inhalation anesthetic for short operative procedures, ask about Vinethene. It produces rapid induction of anesthesia and rapid, complete recovery with infrequent nausea or vomit-

The Wm. S. Merrell Com-Cincinnati, Ohio pany, (Booth 105), will feature several new and original products of Merrell Research, together with a number of well-known pre-

scription specialties of established usefulness in clinical medicine. Representatives in attendance will welcome your inquiries regarding the therapeutic application of any Merrell medicinal agents.

Philip Morris & Co. Ltd., Inc., New York (Booth 62), will demonstrate the method by which it was found that Philip Morris cigarettes, in which diethylene glycol is used as the hygroscopic agent, are less irritating than other cigarettes. Their representatives will be happy to discuss researches on this subject, and problems on the physiologic effects of smoking.

National Live Stock and Meat Board, Chicago (Booth 7), invites you to visit their booth and view their nutrition material, much of which has been prepared during the last year. Both desk-size and classroom models of the Nutrition Yardstick will be displayed.

Nepera Chemical Co., Inc., Yonkers, New York (Booth 88), extends a cordial invitation to the members of the Medical Society of the State of New York to visit their booth. Representatives will gladly discuss urinary antisepsis with interested physicians, with particular reference to Mandel-amine, a chemical combination of mandelic acid and methenamine. Because of its increased effectiveness with comparatively small dosage in the treatment of urinary tract infections, Mandelamine offers the advantages of minimal by-effects and ease of administration.

Novocol Chemical Manufacturing Co., Inc., Brooklyn, New York (Booth 10), for thirty-three years has devoted its energies to the development of saler and more potent local anesthetics. We suggest that you investigate the reasons for the popularity that Menocaine solutions enjoy with the medical profession. Our anesthetic containers that permit the direct injection of sterile solutions into the tissues are a "must see" on the list of exhibits you plan to

Nutrition Research Laboratories, Chicago (Booths 51 and 52), will exhibit Ertron, high potency Whittier Vitamin D, used widely in the treatment of chronic arthritis. The new plastic models and transparencies pertaining to arthritis will be shown. All literature pertaining to the use of the product will be available to members and guests of the Society. Companion products of interest to the profession will also be exhibited.

Ortho Products, Inc., Linden, New Jersey (Booth 53). In addition to their recognized proprietaries, Ortho-Gynol, Ortho-Creme, and Ortho Diaphragus, Ortho Products is featuring several recent developments in pharmaceuticals. They are: Nexital for menopausal therapy, Nutri-Sal for use in selected cases of infertility, and Aci-Jel, an efficacious therapeutic vaginal jelly.

Parke, Davis & Company, Detroit (Booth 54). At this exhibit, which has been streamlined because of present wartime requirements, you will find many new and scientific pharmaceutic and biologic products. Included in

this display are such outstanding preparations as Phemerol, a relatively non-toxic and nonirritating germicide and antiseptic, vitamin products, sulfa drugs, despeciated antitoxins, and numerous other outstanding products of timely interest. Able and courteous members of the Parke, Davis & Company staff are in daily attendance to serve you.

Pet Milk Sales Corporation, St. Louis, Missouri (Booths 81 and 82). A complete display of material illustrating the time-saving Pet Milk services available to a large same saving the same saving same saving the same saving save saving savin available to physicians. Specially trained representatives will be in attendance to give you information about the production of Pet Milk and its use for infant feeding. Miniature cans will be given to physicians visiting the exhibit.

Pitman-Moore Company, Indianapolis, Indiana (Booth 19). You are cordially invited to visit the Pitman-Moore Company display. This exhibit will

# In the Dietary Adjustment

### DEMANDED BY FEBRILE DISEASE

During periods of acute febrile disease, dietary adjustment must be made to satisfy the change in nutritional demands. Protein requirements are increased 50 to 100 per cent, caloric expenditure is raised because of increased heat loss, and vitamin needs, especially those of the watersoluble groups, are greater. Only by meeting these altered requirements can recovery be hastened, can convalescence be shortened, and the usual lethargy reduced in severity and duration.

Designed to supplement the diet dur-

ing periods of increased metabolic activity, Ovaltine is a powerful weapon in preventing nutritional insufficiency during these periods. The abundantly supplied nutrients of this palatable food drink are quickly assimilated and metabolized. Its delicious taste makes it appealing even to the seriously ill patient who usually presents a feeding problem. And because Ovaltine greatly reduces the curd tension of the milk in which it is dissolved, it leaves the stomach promptly, rarely produces nausea or anorexia.

THE WANDER CO., 360 N. Michigan Ave., Chicago 1, Illinois

# Ovaltine

be representative of our comprehensive line of pharmaceuticals and biologics. Of particular interest will be our new suspension of sulfathiazole, Magmoid Sulfathiazole, and several other recently announced additions to our list of products. Come, rest, and visit

Poloris Company, Inc., Jersey City, New Jersey (Booth 25) This exhibit will feature a display of the medicinal ingredients contained in Poloris Dental Poultice, to acquaint the members of the medical profession with the purpose of Poloris Dental Poultice; namely, local counterirritation for the emergency treatment of inflammation, congestion, or irritation of the teeth and gums

The Procter & Gamble Company, Cincinnati, Ohio (Booth 63) Visitors will be acquainted with the qualities of Ivory Soap which have resulted in Ivory's being recommended "by more doctors than all other brands of soap together" Copies of Ivory's popular booklet, "Bathing Your Baby the Right Way," prepared with the cooperation of a world-famous maternity center, will be available free of charge to visitors

The Radium Emanation Corporation, New York (Booth 59), will exhibit a wide variety of instruments and applicators used in modern radium therapy, including permanent and removable composite, leakproof Radon seeds. The advantage of these seeds will be demonstrated by magnified sections showing their constructions in detail

Rare Chemicals, Inc., Harrison, New Jersey (Booth 33). Eucupin, described as the local anesthetic—analgesic with "staying power" (aqueous and oil solutions, ointment, and suppositories). Other Rare products include: Arsenoferratose (palatable hematinic), Gitalin (digitalis preparation), Optochin HCl (specific in pneumococcic infections of the eye), Salysal (analgesic, antirheumatic), and Validol (sedative)

Riedel-de Haen, Inc., New York (Booth 93), are pacemakers of bile acid therapy. Decholin and Degalol initiated a new era in the treatment of biliary tract disorders. Physicians are cordially invited to Booth 93, where representatives of Riedel-de Haen, Inc., will be glad to discuss the wide range of clinical indications of these two chemically pure bile acid products

Ritter Company, Inc., Rochester, New York (Booths 46 and 47), is displaying many items of advanced medical equipment for progressive doctors, among which are. medical motor chair, ear, nose, and throat units, rest and relief stools, fluorescent lights, x-ray units, surgical cuspidors, sterilizers, compressors, and bone surgery engines. Ask for complete demonstrations

Sandoz Chemical Works, Inc., New York (Booth 106) The non-narcotic rehef of migraine with Gynergen (ergotamine tartrate) will be of interest to physicians Just released is Glysennid for atonic constipation—it contains sennosides A and B, crystalline glycosides recently isolated from senna leaves in the Sandoz Research Laboratories. Also

displayed are Cedilanid (lanatoside C), a stable crystalline glycoside from digitalis lanata and not present in purpurea; Syrup Neo-Calglucon, a palatable, highly concentrated preparation for oral calcium therapy readily absorbed from the digestive tract Other well-known Sandoz products include Bellergal, Belladenal, Bellafoline, Digilanid, Scillaren, Strophosid, Calglucon, and Neo-Calglucon

Saratoga Springs Authority, New York (Booth 117), again will serve at its booth Saratoga Geyser, the natural alkaline water bottled by the State at Saratoga Spa Literature descriptive of the wide range of treatments and therapies available at the Spa also will be distributed at the booth

Schering Corporation, Bloomfield, New Jersey (Booth 97) Representatives will be present to discuss the latest developments in endocrinology Estinyl Tablets, the new oral estrogen ethnyl estradiol, Oreton-F Pellets, and Priodax will be featured Estinyl, a derivative of the natural hormone alpha estradiol, is the most potent oral estrogen available today Priodax is the new Schering oral opaque material for cholecystography

Julius Schmid, Inc., New York (Booths 91 and 92) You are invited to view the Kodachrome illustrating a simplified method of inserting and properly seating a vaginal diaphragm. These Kodachromes have been prepared from anatomic drawings based on an x-ray study of a vaginal diaphragm in postion. A color chart for use in instructing patients is available to physicians.

G. D. Searle & Co., Chicago (Booth 60), will show a number of new products of Searle Research which have contributed so much to the recent armamentarium of the physicians Products such as Searle Aminophyllin, Metamucil, Ketochol, Floraquin, Gonadophysin, Tetrathione, Pavatrine, and Diodoquin are results of this research, which has been greatly expanded in the new Searle Laboratories An illustration of the new laboratories will be featured in the exhibit

Sharp & Dohme, Inc., Philadelphia (Booth 50), will feature their new sulfonamide, Sulfamerazine, and also Sulfasuvidine, Lyovac Normal Human Plasma, Tyrothricin Concentrate (Human), Depropanex, Delvinal Sodium, Propadrine, Hydrochloride products, and Lyovac Tetanus Antitovin, Bovine Capable, well-informed representatives will be on hand to welcome all visitors and furnish information on Sharp & Dohme products

J. R. Siebrandt Manufacturing Co, Kansas City, Missouri (Booth 14) The new Clayton Transfixion Splints are now offered to the medical profession by Siebrandt These splints are the results of years of experimental research and development in collaboration with Dr Charles F Clayton of Fort Worth, Texas In the past seven years he has used this method of external fixation successfully in over 500 cases for both open and closed reductions. They have many advantages over other type transfixion splints Built of plastic, transparent to x-ray—simple in construction and extremely light in weight—have no complicated mechanism to adjust—climinate plaster cast and reduce cost and

# EUTIC TEAMWORK

# Vitamin "B" Complex fortified with Vitamin "C"

Research has shown that vitamins B and C appear to work as a team in effecting beneficial changes in cellular physiology. This was clinically manifested by improvement in pathology of the upper respiratory mucosa and the retina when the two vitamins were given together. When only one was used, this

favorable reaction did not occur.

Vitamin "B" Soluble (Walker) is derived from brewers yeast—its potency increased so that three capsules meet the minimum daily needs for vitamin B factors recommended by the U.S. Government.

Professional samples sent on request to Myron L. Walker Co. Inc., Mount Vernon, New York.

### VITAMIN "B" SOLUBLE (WALKER)

[Continued from page 808]

time of treatment. The exhibit will also include a complete line of bone instruments and fracture equipment, including the Davidson Director for hip nailing and the Goodwin Bone Clamp, which simplis fies the technic for open reduction when wiring long bone fractures.

Singer Sewing Machine Co., New York (Booths 8 and 9). Specially trained demonstrators will exhibit the Singer Surgical Stitching Instrument. This instrument, which was developed in close cooperation with the surgical profession, has attracted much attention at medical conventions and clinical trials have definitely proved its success and practicability. All doctors, nurses, and hospital staff members are cordially invited to see this unique contribution to surgery. Motion pictures of operations showing the instrument in use will be shown by the Medical Film Guild, Booths A and B. Free literature describing the instrument in detail will be available.

Smith, Kline & French Laboratories, Philadelphia (Booth 49). Benzedrine sulfate tablets and Paredrine-Sulfathiazole Suspension are featured at this exhibit. The potent central nervous

stimulation of benzedrine sulfate offers, throughout a wide range of application, "a therapeutic rationale which, in its very efficiency, cuts across the old categories." Paredrine-Sulfathiazole Suspension is the only vasoconstrictor-sulfonamide combination which combines prolonged bacteriostasis, nonstimulating vasoconstriction, and therapeutically ideal pH. Not a solution, but an aqueous suspension of "micraform" crystals of free sulfathiazole, it produces no irritation, no stinging, and no hyperemia. Our especially trained professional representatives will be glad to discuss with you the potentialities and possible indications of our products in your own practice.

Spencer Incorporated, New Haven, Connecticut (Booth 24). An interesting exhibit featuring individually designed supports for abdomen, back, and breasts. Spencer supports are prescribed as an aid to treatment for the following: hernia; visceropand to decading for the following: nernia; visceroptosis with symptoms; postoperative; back conditions; maternity and postpartum; obesity; movable kidney; breast conditions; and certain forms of heart disease. Samples are on display and trained representatives will be available to answer your questions. questions.

E. R. Squibb & Sons, New York (Booth 114). Physicians attending the meeting of the Medical Society of the State of New York are cordially invited to visit the Squibb exhibit. Several new items will be shown. Among them is Intocostrin, the standardized purified curare extract now widely used to soften convulsion in shock therapy; a new, highly useful therapeutic multivitamin preparation; a sulfathiazole-ephedrine derivative combination for ophthalmic use. Information on new products use-ful in venereal disease therapy and control will also be available.

Frederick Stearns & Company, Detroit (Booths 99 and 100). Doctors are cordially invited to visit our attractive convention booth to view and discuss

outstanding contributions to medical science developed in the scientific laboratories of Frederick Stearns & Company. Our professional representa-tives will be pleased to supply all possible information on the use of such outstanding products as Neo-Synephrine Hydrochloride for intranasal and ophthalmologic use, Neo-Synephrine Sulfathiazolate, amino acids (Parenamine) for parenteral and protein feeding, Mucilose for bulk and lubrication, Fergon (ferrous gluconate), Gastric Mucin, Susto, Trimax, Appella Apple Powder, Nebulator with Nebulin A, and our complete line of vitamin prod-

R. J. Strasenburgh Co., Rochester, New York (Booth 110). The feature of this exhibit will be a demonstration of the safe nontoxic spasmolytic action obtained with Metropine (Methyl Atropine Nitrate, Strasenburgh). (A) Metropine has only one-tenth the mydriatic action and one-fiftieth the toxicity of atropine; (B) absence of the undesirable side reactions often observed with atropine is assured.

Tampax Incorporated, New York (Booth 22). Now. more than ever, you should not miss visiting Booth 22 and the opportunity to check the many advantages offered by this highly approved form of intravaginal catamenial protection—so widely preferred because of its many unique features. Special attendants will be glad to demonstrate to physicians and their wives full details as to its functional design, absorptive efficiency, comfort, and convenience.

Tarbonis Company, Cleveland, Ohio (Booth 83).
Besides samples of Tarbonis, a comprehensive, profusely illustrated brochure will be presented to visitors at the Tarbonis booth, describing the established therapeutic efficacy of this unique tar preparation in the management of cutaneous disorders, as well as its remarkable value in the cortain of the cortain o rection and prevention of industrial dermatoses.

Teca Corporation, New York (Booth 66), will show apparatus for an improved method of hydrogalvanic applications for hospital and office use. The equipment is used in conjunction with any bathtub or the Teca tank combination. This unit affords a new and highly efficient treatment, general as well as local, by means of two independently controllable circuits and the special Teca electrodes allowing circuits and the special Teca electrodes, allowing utter flexibility of application.

E. Trautman Associates, Inc., Columbus, Ohio (Booth 80). Vitalert (high potency multivitamin) and Vitallergy (high C with A and B.) feature the latest development in the vitamin field, by separating in one really the oil republic vitamins from the ing in one pellet the oil-soluble vitamins from the water-solubles. This special construction permits maximum absorption of each in its proper media and environment. The oil calubles held in an acidand environment. The oil-solubles, held in an acidproof inner coating, pass intact into the intestines, after the water-solubles have disintegrated in the acid medium of the stomach.

U. S. Vitamin Corp., New York (Booth 84). Exhibit depicts the various devitalizing factors which tend to destroy the vitamin-mineral content of foods before they reach the table. Displayed, too, is an enlarged Funk-Dubin Visual Vitamin Deficiency Chart show-

### [Continued from page 810]

ing the various organs of the body and depicting symptoms arising as a result of vitamin deficiency of each.

Walker Vitamin Products, Inc., Mount Vernon, New York (Booth 40), are exhibiting an extensive line of ethical vitamin products. Featured products are the Council-accepted A-D Drops and the various vitamin tablets. Also of special interest is the new super-potency B complex product, Neobevin, and the high-potency Mineralized Vitamin Tablets. This new multivitamin-mineral product is fat-free and without any fishy after-taste. Samples will be available.

Wallace & Tiernan Products, Belleville, New Jersey (Booth 69), cordially invites you to visit our exhibit and register for literature and samples. Azochloramid, the modern chlorine antiseptic, and Monomestrol, a new synthetic estrogen, will be displayed. Motion pictures of several interesting surgical procedures (general, plastic, and orthopaedic) will be shown. Our representatives will welcome your questions and comments.

William R. Warner & Company, Inc., New York and St. Louis (Booths 76 and 77) will exhibit its extensive line of specialty pharmaceuticals, including several new preparations of interest to physicians engaged in general and specialized practice.

Westwood Pharmacal Corp., Buffalo, New York (Booth 35), will exhibit new sulfathiazole solutions

in water-soluble, nonirritant, extremely benign bases; Westhiazole 20-20 per cent sulfathiazole, of ointment-like consistency, suggested in surgery, gynecology, and dermatology, pH 7.2; Westhiazole ENT-5 per cent solution in liquid form, suggested for nasopharyngeal infections, pH 6.2; Lowila—soapless skin cleansers for the treatment and prevention of industrial dermatoses, pH approximating that of normal skin.

White Laboratories, Inc., Newark, New Jersey (Booth 67). You will find interesting copies of a series of publications under the general title Diagnostic Aids to Vitamin Deficiency Conditions. Medical service representatives in attendance will be very glad to discuss these with you. The latest clinical reports on results of the use of White's Vitamin A and D Ointment in the treatment of burns and various types of ulcers will also be available. This is a product which you will undoubtedly find of great interest.

Winthrop Chemical Company, Inc., New York (Booths 102 and 103), has available a number of interesting and highly informative booklets. Ask particularly for your copy of Penicillin, Annolated Bibliography, and Demerol, about the new analgesic, spasmolytic, and sedative.

Wyeth Incorporated, Philadelphia (Booths 70, 71, 72, 73, and 74), invite you cordially to visit their booths, which will feature the medical specialties of their nutritional, biologic, and pharmaceutic division.

IN DISORDERS OF GASTRIC FUNCTION

GASTRON is an original extract of the organic and inorganic constituents of the entire mucosa of the hog-stomach including the pylorus. The acidified and aromatized extract is incorporated in an aqueous-glycerin-propylene glycol menstruum which preserves the enzymatic activity. The preparation contains no alcohol. It is accurately standardized by assay.

GASTRON is indicated as replacement therapy in atrophic gastritis, and as an aid in the treatment of chronic gastritis. It is of value as adjunctive treatment in the anemias, and in certain gastric deficiencies associated with convalescence and old age. It is worthy of trial in the nausea and vomiting of pregnancy.

GASTRON WITH IRON also is available for prescription use

# How irritation varies\_from different cigarettes

Tests made on rabbits' eyes reveal the influence of hygroscopic agents

Edema 0.8	Cigarettes made by the PHILIP MORRIS method
2 Edema 2.1	Cigarettes made with no hygroscopic agent
3 Edema 2.7	Popular cigarette #1 made by the ordinary method
4 Edema 2.6	Popular cigarette #2  -made by the ordinary method
5 Edema 2.7	Popular cigarette #3  -made by the ordinary method
6 Edema 2.7	Popular cigarette #4made by the ordinary method

CONCLUSION:\* Results show that regardless of blend of tobacco, flavoring materials, or method of manufacture, the irritation produced by all ordinary cigarettes is substantially the same, and measurably greater than that caused by PHILIP MORRIS.

CLINICAL CONFIRMATION:\*\* When smokers changed to PHILIP MORRIS, every case of irritation of the nose and throat due to smoking cleared completely or definitely improved.

# IN B-COMPLEX DEFICIENCY

Increasing evidence indicates the importance of providing all the factors of the B-complex in the treatment of vitamin deficiencies, though the symptom complex may be dominated by a single factor.

Plexamin, biologically standardized, presents the entire B-complex, as derived from a natural base, plus the known essential factors added in synthetic form, in proportions recommended for optimal nutrition.

Not only because of its rational formula, but also because of its notably reasonable price, Plexamin is being given preference by a constantly growing number of physicians.

THE PAUL PLESSNER COMPANY

35 YEARS OF ETHICAL SERVICE

DETROIT 2 • MICHIGAN

Each capsule of Plexamin contains not less than:

> Plus all the other factors supplied by the yeast and liver concentrate base.

### Women's Medical Society of New York State

### Annual Meeting

Hotel Pennsylvania, New York-May 7-8, 1944

THE thirty-eighth Annual Meeting of the Women's Medical Society of New York State will be held in New York, May 7-8.

The President's Tea will be held on Sunday, May 7, from 4:00 P.M. to 6:00 P.M.

The regular annual meeting will be held on Monday morning, May 8.

The program for Monday is as follows: 9:00 A.M.-9:30 A.M.—Councilors' Meeting; Registration:

10:00 A.M. to 12 Noon-Business Session; 1:00 P.M.—Luncheon; 2:00 P.M. to 5:00 P.M.—Scientific

The following scientific session has been planned: "Symposium on the Work of Medical Women in the Armed Forces."

Dependability in Digitalis Administration

තී කී

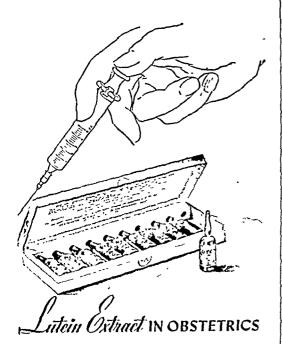

Being the powdered leaves made into physiologically tested pills, all that Digitalis can do, these pills will do.

Trial package and literature sent to physicians on request.

DAVIES, ROSE & COMPANY, Limited

Manufacturing Chemists,

Boston 18. Massachusetts

(H. W. & D. Preparation of Corpus Luteum)

Lutein Extract is indicated in obstetrical complications, especially threatened and habitual abortion.\* Injections of Lutein Extract in adequate dosage inhibit uterine contractions.

A controlled clinical study showed that patients receiving Lutein Extract were carried to delivery in a high percentage of cases as compared with those not treated with Lutein. In these cases it may be given intravenously. There were no untoward reactions when relatively large doses were given by the intravenous route.

Lutein Extract in smaller doses is also administered intramuscularly in nausea and vomiting of pregnancy and in relieving the symptoms of ovarian insufficiency.

Lutein Extract is supplied in 3 c.c. and 1 c.c. size ampules, packed in boxes of 10 or 100 ampules.

Literature and natural color illustrations will be sent to physicians on request.

#### POST-WAR POPULATIONS

Of interest to future physicians as well as those now practicing, should be the probable change in population changes following the war. The future is still as unpredictable as it has ever been, but according to a theory based on the survey made by Dr. Philip M. Hauser, assistant director of the Census Bureau, the West and the South are favored for a steady growth in population.

Of all sections of the country, the East has the least chance of a post-war growth.

In addition to accelerating population trends, which were observed in peacetime, Dr. Hauser points out that for the first time the United States has a surplus of women caused by the war. Gaps, also, have been created in the age structure which will last for generations. The gradual decline in national population growth which set in about fifty years ago will be accentuated by the war.

Areas most likely to retain war growth are those which showed the most rapid growth in years just prior to the war and during the war years. Such places include cities in Georgia, South Carolina, Texas, Florida, Alabama, Arizona and California—plus Washington, D.C.

Cities second likeliest to succeed in retaining their growth numbered many in the same States, plus New Orleans, Norfolk, Portsmouth, Newport News, and Richmond. Portland in Maine and Wilmington, Del., appear to be the only eastern cities mentioned.

Places which grew rapidly in wartime, but at a lower rate from 1920 to 1940, will need special programs in converting from war to peace activity in order to continue their growth. Some cities which grew beyond average in 1920-40 but which lost population or grew smaller during war have, nevertheless, an excellent prospect of coming back.

Metropolitan areas have a gloomier outlook for the future. These, Dr. Hauser predicts, have only a fair chance of post-war growth. Among those so fated are—our own New York City, northeastern New Jersey, Atlantic City, Chicago, Decatur, Cleveland, Toledo, Youngstown, Flint, Grand Rapids, Fort Wayne, South Bend, Huntington (W. Va.), Ashland (Ky.), Milwaukee, Roanoke (Va.) and Topeka (Kan.).

Areas destined neither to grow rapidly nor recoup losses after the war cover those which have decreased in population or grown little during the war and had in population or grown little during the war and had the same trend in the two previous decades. In the war trend in the two previous decades. In New York State such locations included Albany, Schenectady, Troy, Buffalo, Niagara, Rochester, Syracuse, Utica and Rome. Among larger cities in other States, Boston, Providence and Pittsburgh

were mentioned.

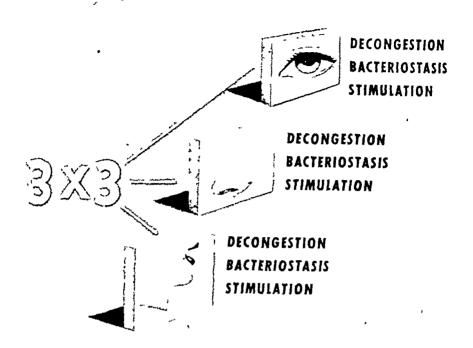

Population growth has been more rapid in the South and West since Pearl Harbor than it has in the North. The North has the largest percentage of metropolitan areas in the class with the least possible chance of growth after the war. The West had the highest percentage of areas in the class most highest percentage of areas in the class most likely to retain wartime population growth, with the South having the next highest percentage in this class.

**NOT ONLY CONTRA-INFECTIVE**—There are important properties in addition to bacteriostasis which make ARGYROL the "Physiologic Antiseptic"—one which works in harmony with the normal defense functions of tissues, nerves, cilia and circulatory system. Of first importance is the fact that ARGYROL is both antiseptic and decongestive.

**NOT ONLY CONTRA-CONGESTIVE**—There is an EXTRA FACTOR in mucous membrane antisepsis, in decongestion with ARGYROL. This important factor is physiologic stimulation of tissue defense function. It is a combination of physico-chemical and bacteriostatic properties which go far beyond the usual concept of what an antiseptic should do. For:

ARGYROL IS DETERGENT · PROTECTIVE · PUS-DISLODGING · INFLAM-MATION-DISPELLING · SOOTHING · STIMULATING TO GLANDS, TISSUES.

Each effervescent tablet dissolved in water provides the sodium salt of aspirin 8 5 grs and sodium citrate 27 grs

### COMBINED BUFFERS FOR ADDED EFFECTIVENESS

The actions of the buffer alkalı mechanisms, together with the  $CO_2$  factor of the effervescent base, combine to

- (1) Speed up stomach emptying time
- (2) Allow more rapid absorption of medicament
- (3) Protect the analgesic—sodium acetylsalicylate—from hydrolysis in the stomach
- (4) Reduce tendency to gastric upset

Acetyl-Vess is supplied in bottles of 25 tablets through your prescription pharmacy or medical supply house Ethically promoted .

### REVISION IN ADVERTISING CODE BY ENGLISH PROPRIETARY GROUP

Continued criticism of patent medicine advertising in England has forced the Proprietary Association of Great Britain to enact a revised and much stricter code of advertising standards which members must adhere to under penalty of expulsion from the organization.

Twelve prohibitions comprise the code which are summarized by the *Pharmaceutical Journal* (British) as follows:

- 1. No advertisement shall contain any matter which in any way, directly or by implication, departs from truth as to character of the product or suitability for the purposes for which it is recommended in any firm's advertisement.
- 2. No advertisement shall contain any matter which can be regarded as holding out for the prevention, cure, or relief of serious diseases which should be rightly under the care of a registered medical practitioner.
- 3. No proprietary medicine shall be advertised in terms which guarantee to cure a specific ailment or which imply such a guarantee when offering to return money paid by a purchaser.
- 4. No advertising shall contain any matter, which, in its reasonable construction, can be calculated to create fear or apprehension on the part of the reader that he or she is suffering or may without treatment, suffer from serious ailment.
- 5. If any testimony is used, it must have been honestly obtained and must be limited to the actual views of the user.
- 6. No advertisement shall contain any reference to doctors or hospitals, whether British or foreign, unless such references are substantiated by independent evidence lodged with the secretary of the association.
- 7. No proprietary medicine advertisement shall offer prize competitions or schemes calculated to lower the tone of the industry.
- 8. Illustrations and printed matter shall be in good taste.
- 9. No member of the association shall make use of any imitation of the trade marks or names of competitors or imitate packages.
- 10. No association member shall, without authority, use titles or descriptions which may lead persons to believe that the product recommended emanates from any hospital or official source.
- 11. Every member of the association must provide his advertising agent with copies of the code and every member will be held responsible for the form of any advertisements appearing over his name.
- of any advertisements appearing of the code will render a 12. Any infringement of the code will render a member liable to suspension or expulsion.

A commendable actic

THE BETA-CONCEMIN FORMULA is based on a special fraction of liver that is rich in the whole vitamin B complex as it is found in this complete, natural source. It is adjusted by addition of crystalline B vitamins to assure adequate intake of those B complex factors known to be important in human nutrition and found deficient most frequently in clinical practice.

Pharmacological studies reveal that the Special Liver Fraction used in Beta-Concemin, when administered in addition to all the established vitamins, supplies other factors essential for life, growth, hemoglobin formation and normal cutaneous structure. It contains the recently identified anti-anemic component, vitamin B<sub>c</sub>.

## **BETA-CONCEMIN**

Brand of B Vitamins

### Potent, Complete Vitamin B Complex

Pleasant, fruit-flavored Elixir Beta-Concemin is supplied in 4-oz. and 12-oz. bottles; dosage is 2 or 3 teaspoonfuls daily. Convenient Beta-Concemin Tablets are in bottles of 100; 4 to 6 tablets are given daily.

Capsules Beta-Concemin with Ferrous Sulfate are expressly designed for treating iron deficiency anemias. Dosage is 4 to 6 daily. Bottles of 100.

### A "SAVAGE" CONTRIBUTION TO . ANESTHESIA

To the old saying that "one man's meat is another man's poison" we might add that "one man's poison is another man's anesthesia," for curare, that deadly poison used by South American Indians to make their arrows more lethal, has now been used in almost a thousand recorded cases to assist anesthesia by members of the American Society of Anesthetists

Dr. Harold R. Griffith of Montreal, pioneer in the use of curare, reported in a recent issue of the Canadian Medical Association Journal that dramatic and complete relaxation results, especially in abdominal surgical cases, but cautioned that an overdose may paralyze breathing muscles

Dr. Stewart C. Cullen, a member of the board of the A.S.A., has found by the use of this drug, a lighter and less dangerous plane of anesthesia may be considered. be employed. However, he nonetheless withholds complete and unqualified recommendation, pending additional clinical and laboratory findings.

#### A PH. FOUNDATION

An effort is being made by the Drug and Pharmaceutical industry to raise a million dollars as a foundation for improving and maintaining pharmaceutical education.

Appeals are being made to all members of the industry to contribute with the point of making the industry a lot safer by voicing their support to assist pharmaceutical colleges to survive critical war years. The shortage of registered pharmacists has already reached the critical stage and without immediate financial assistance many colleges of pharmacy will be forced to lower present high standards, shorten four-year courses or otherwise cut expenses if they are to live within limited incomes from war-reduced enrollment.

Should the schools of pharmacy fail (through no fault of their own) in their job of supplying technically and scientifically trained personnel, state the sponsors, to man the retail pharmacies, pharmaceutical industries, hospitals, etc., the integrity of drug distribution and the excellence of drug production would suffer.

Even the small firm, they point out, with perhaps just one proprietary product which requires no pharmacist to dispense might still recall that his product is, most often, sold by a registered pharma-

cist; that without pharmacists there might be no drug stores and without drug stores there might be government dispensaries . . . . probably doling out free medicines, made in tax-supported government plants.

#### TO SAVE FUEL

One way to help save fuel is to put salt on the fire. This is an old remedy for helping to keep a chimney functioning well, but now the United States Bureau of Mines recommends that table salt thrown on a furnace fire reduces soot formation and thus saves fuel

Householders who have found it necessary to hand-clean surfaces of their heaters two or three times a week, should throw one or two cupfuls of salt on the fire every day

Salt volatilizes at high temperatures and forms a vapor which settles on the surface of the soot. This lowers the ignition temperature of the soot and enables it to burn away more readily.

Tables Contains.

Laberal

Laboral

L

Formula: Each tablet contains ¼ grain phenobarbital and the three chief alkaloids, equivalent approximately to 9 minims of tincture of belladonna.

Bolbarb No 2 has the same alkaloidal content but ½ grain phenobarbital per tablet.

CHARLES C. HASKELL & CO., INC., RICHMOND, VIRGINIA

## EULOGY OF THE DOCTOR

HERE are men and classes of men that stand above the common herd—the soldier, the sailor, the shepherd not infrequently, the artist rarely, rarelier still the clergyman, the physician almost as a rule. He is the flower of our civilization and when that stage of man is done with, only to be marvelled at in history he will be thought to have shared but little in the defects of the period and to have most notably exhibited the virtues of the race. Generosity he has, such as is possible only to those who practice an art and never to those who drive a trade: discretion, tested by a hundred secrets, tact, tried in a thousand embarrassments and what are most important, Herculean cheerfulness and courage. So it is that he brings air and cheer into the sick room and often enough, though not so often as he desires, brings healing.

## An Advance in Vaginal Therapy

IN ACI-JEL, Ortho presents to the profession a water-dispersible acid jelly for use in the treatment of most vaginal infections.

Through increased knowledge of the physiology of the vagina. the importance of its normal acidity in maintaining a healthy flora has been firmly established. Reports in the literature of recent years indicate that often the most satisfactory method of employing acid vaginal therapy is by the use of a buffered acid jelly.

The ability of Aci-jel to restore normal acidity (thereby inhibiting the growth of pathogens and other organisms abnormal to the vagina) has been stressed in clinical evaluation of the therapy of vaginal infections.

HOW APPLIED: Frequency of application. as well as duration of treatment, is determined by the physician, depending on the progress of the case. Generally, the treatment for the first few

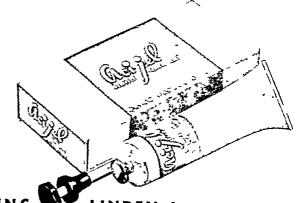

weeks is: an applicator-ful (5 cc.) of Aci-jel in-

travaginally before retiring and another 5 cc. in the morning. A cleansing douche is suggested

about 8 hours after application.

HOW SUPPLIED: Aci-jel is available in tubes of 31/4 ounces, together with a measured-dose applicator. It is also available without an applicator when prescriptions are refilled.

Dexin' does make a difference

'DEXIN'

HIGH DEXTRIN CARBOHYDRATE

Mother looks forward to a pleasant, peaceful night of undisturbed sleep for baby and herself.

With 'Dexin', she knows that baby takes his full feeding more readily and is less likely to be awakened by unsatisfied hunger, and that distention, colic and diarrhea are minimized because 'Dexin' provides a relatively non-fermentable form of carbohydrate.

Milk modified with 'Dexin' is exceptionally palatable and not too sweet. It does not dull the appetite. 'Dexin's' high dextrin content promotes the formation of soft, flocculent curds. 'Dexin' is soluble in hot or cold milk.

The ORIGINAL ENTERIC. COATED TABLET
THE ORIGINAL ENTERIC. COATED T

Clinical experience and carefully controlled studies in humans have definitely proven the value of Theobromine Sodium Acetate in treating certain Cardiovascular and Renal diseases, and the value of the enteric coating in permitting adequate dosage without causing gastric distress.

Supplied—in 7½ grains with and without Phenobarbital ½ grain; in 5 grains with Potassium Iodide 2 grains and Phenobarbital ¼ grain (cost approximately \$1.50 per bottle of 100 tablets); and in 3¾ grains with and without Phenobarbital ¼ grain (cost approximately \$1.00 per bottle of 100). Capsules, not enteric coated, are available in the same potencies for supplementary medication.

\*Literature giving confirming bibliography, and physicians samples will be furnished on request.

Pharmaceutical Chemists Since 1852

## And Now ... you may order your **Pollen Testing Sets**

by the name of your state

RE YOU treating hay fever patients in Maine or California ... or Washington or Florida?

You may order an Arlington Diagnostic Dry Pollen Testing Set made up of the specific wind-borne pollens (trees, grasses, and weeds) indigenous to your particular section of the country, each set containing a minimum of 23 vials.

Each vial contains dry pollen sufficient for at least 30 tests (50 mg.) which remains active indefinitely at room temperature. Accompanying the pollen testing set is a schedule card for the botanical area for which the testing material is intended, which names the pollens common to that area, together with the approximate pollinating dates. A sup-

ply of N/20 Sodium Hydroxide is furnished with each set, for use as a solvent in testing.

IMPORTANT-since many hay fever sulferers are also sensitive to house dust, a 50 mg, vial of this allergen is included in each diagnostic set.

Arlington Dry Pollens are packaged in a handy case so that physicians may have immediately available specific pollens necessary for testing any hay fever patient.

# Why BIOLAC for infant feeding?

## **BIOLAC** saves valuable time!

No extra ingredients to calculate, because it's a complete infant formula. Biolac provides for all nutritional needs of the young infant except Vitamin C.

## BIOLAC formula easy to calculate!

For standard formulas, simply dilute 1 fl. oz. of Biolac with 11/2 fl. ozs. water. Feed 21/2 fl. ozs. of this formula daily for each pound of body weight.

## **BIOLAC** minimizes errors!

Less chance of upsets due to errors in preparing formulas. Less chance of formula contamination, too, because all ingredients in Biolac are sterile. It requires only simple dilution with boiled water, as you prescribe.

\*Biolac is prepared from whole milk, skim milk, lactose, vitamin B1, concentrate of vitamins A and D from cod

liver oil, and ferric citrate. Evaporated, homogenized, sterilized. Vitamin C supplementation only is necessary. For detailed information, write Borden's Prescription Products Division, 350 Madison Avenue, New York 17, N. Y.

NO LACK IN

BIOLAC

Borden's complete infant formula

# CIENCIES' T

Investigations in industrial plants reveal that malnutrition seriously hinders production.

That Vitamin B reinforcement is one of the outstanding needs in the presentday setup is attested to by various authorities: "When men are doing hard physical labor, even for a few days, there is an imperative need for an adequate daily intake of the vitamin B complex if Physical fitness is to be maintained."†

Emphasized also by investigators is the need for the Whole B Complex

"Deficiencies of the B complex usually occur together . . . "††

BEZON\* is Whole Natural Vitamin B Complex—concentrated to high potency from natural sources—no synthetic factors are added. Only Whole Natural Vitamın B Complex contains all 22 B vitamins.

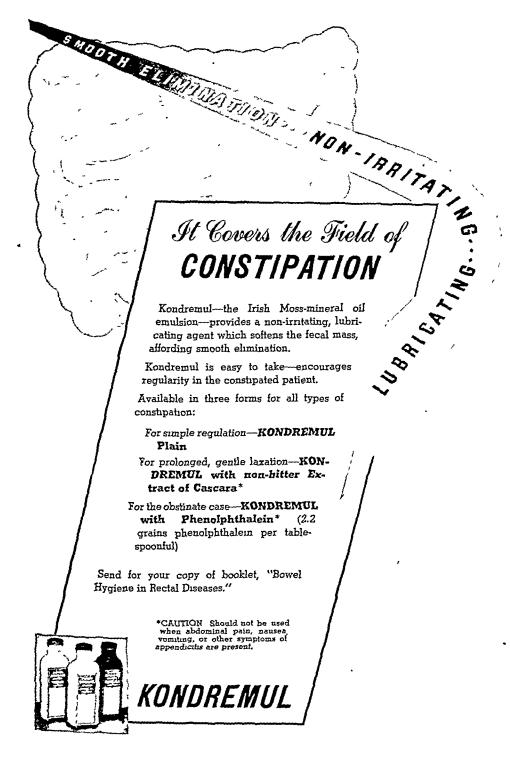

BEZON is the only Whole Natural Vitamin B Complex which contains one milligram of natural thiamine, two milligrams of natural riboflavin, together with all the remaining members of the B complex concentrated in two tabules.

Supplied in bottles of 60 and 200 tabules. Samples and literature available on request

NUTRITION RESEARCH LABORATORIES · CHICAGO

# Walker's A-D DROPS

SOMETHING NEW! Natural esters of vitamin A (distilled from fish liver and vegetable oils), plus activated ergosterol in a vehicle of refined corn oil.

Advantages of this new product are:

- 1. Practically no "fishy" odor or taste.
  - 2; Excellent stability.
  - 3. Each DROP supplies
    Vitamin A—2,000 U.S.P. Units
    Vitamin D— 300 U.S.P. Units
  - 4. It's good—it's flavored with cinnamon.
  - 5. It's "Council Accepted."

From infancy through childhood—for good "A-D" insurance—prescribe WALKER'S A-D DROPS.

# **SULFADIAZINE**

A REPORT<sup>1</sup> has recently appeared describing the use of Sulfadiazine in more than 15,000 soldiers for the prevention of meningococcic meningitis. There was a resultant reduced incidence of infection as compared with controls, a reduced carrier rate and no serious toxic effects eventuated.

Sulfadiazine has been employed for the treatment of acute meningitis with such marked success that in many reported series mortality has been reduced to a relatively insignificant level; and in all series, has been reduced to a relatively low level.<sup>2</sup> One investigator <sup>3</sup> reporting on a series of 1518 cases of acute meningococcic meningitis treated with various sulfonamides, expressed the view that sulfadiazine was the most satisfactory for such treatment.

Literature will be sent upon request

THESE are days which permit no letdown. People are hard at work. They're tense and active. There are tremendous demands upon their energy.

Consequently it is advisable to maintain an energy-supply consistent with such demands.

This involves stressing satisfactory diets—diets with food like bread which is one of the best sources of food-energy.

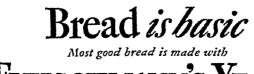

Bread today is particularly valuable. For in addition to its high food-energy value, it affords a good supply of vita-

min and mineral factors — thiamin, niacin, riboflavin and iron.

And it goes a long way toward making up for foods which have become scarce.

These are reasons the government has given bread a place in the basic seven food groups which should be eaten every day.

They are reasons why physicians will find bread a valuable recommendation for normal diets, and frequently useful in the special diets they are called upon to prescribe.

#### "A PLACE FOR EVERY TOE AND EVERY TOE IN PLACE"

. . . a fundamental rule for any footwear construction.

But an orthopedic shoe must be built for more than that in order to prevent or correct foot troubles and deformities. It must follow the pattern of nature as closely as possible to permit proper position and action of every bone and muscle—to allow perfect circulation, correct joint articulation and help strengthen sustaining muscles. It must shift the weight of the body from the arches to the proper "weight-bearing" surfaces and help the doctor's own treatments.

Whether the need is preventive or therapeutic, you will find the right qualities in Pediforme shoes. Many years of continuous service to members of the medical profession authenticates that point.

### NATIONAL POSTURE WEEK

The annual observance of National Posture Week has done much to focus nation-wide attention on the significance of good posture and has encouraged many suffering from poor body mechanics to seek professional counsel.

The importance of good posture to good health and physical fitness will again be emphasized through the distribution of ethical and authoritative literature to schools, colleges, industrial and professional public health educational groups Large numbers of physicians, educators and groups in the field

of public health have expressed their appreciation for this work

It is our hope that our current campaign and efforts will continue to merit this approval and contribute further to America's victory program for physical fitness and for the arduous post-war readjustment period which is anticipated

-Spurgeon, C. H.

Vague symptoms, particularly in the early stages of diseases of the extrahepatic biliary tract, frequently mask the true condition, and delay much needed therapy.

Free drainage through the biliary channels is the primary objective in such conditions. This may be accomplished most efficiently with Cholan DH (pure dehydrocholic acid—Maltbie), not alone through evacuation of the gall-bladder contents—but particularly by a

marked increase (up to 200%) in the flow of bile of especially low viscosity. The use of Cholan DH may frequently forestall the necessity for surgical intervention, by discouraging gall stone formation and the entrenchment of infection.

Contraindications: Occlusive obstruction of biliary tract. Use with caution in acute yellow atrophy, acute hepatitis, eclampsia and progressive jaundice.

Supplied: in bottles of 100, 500 and 1,000 tablets of 33/4 gr. each; also in ampul form, as Cholan DH Sodium (Solution Sodium Dehydrocholate, in 20% contentration), in either 3 cc. or 10 cc. ampuls, 6 to a box.

## Editorial

#### What Others Think, II

You ask, why waste a doctor in Congress, and the question is valid. My answer is taken from a wiser physician than we, who once said, "They that are well need not a physician, but they that are sich." And I believe that our greatest need today for a physician is in Congress.... Congress needs our help as physicians.

So says Dr. Walter H. Judd, Congressman from Minnesota, who should know from his experience on the spot what he is talking about. He continues,

We cannot ignore the fact that the quality and distribution of medical care in America today is madequate and imperfect. This does not affect a large proportion, perhaps less than 10 per cent. At least 80 to 90 per cent of our population has the best medical care in the world.

There are groups, however, who focus their attention only on the 10 per cent, and then plan to scrap the 90 per cent good to salvage the minority. Moreover, these groups have access to machinery that is influential and they mean to carry their program.

When you look at medical care as a purchasable commodity and compare it with food, for instance, you can see why their plans gain an audience. Whenever a shortage exists in any necessary commodity this must either be rationed or it will be acce-ible only to the highest bidder. One or the other of these results will grow out of our present shortage of physicians. It now rests with us to choose. "If we don't lead, I promise we will have imposed on us the solution."

Of course our hope is to salvage what is good in our present system and ultimately to perfect the part that is lacking today. But we will not do that if we permit politicians to work out their own plan. In this, the relationship between the doctor and his patient is destroyed. In this plan inefficiency is uplicle.

We must have better representation in Washington We need a har-on between government and

our profession. "Those who sell what's bad are getting away with it. Why cannot we, who merely want to hold to what's good and add that which is better, do the same?"

And why not? We ask with him. Is there any valid reason?

The seven doctors in the House cannot represent medicine. It would be most harmful if we tried to. We represent the people who send us to Washington. But, and I speak from experience, we need to know what you want and you need to know our problems.

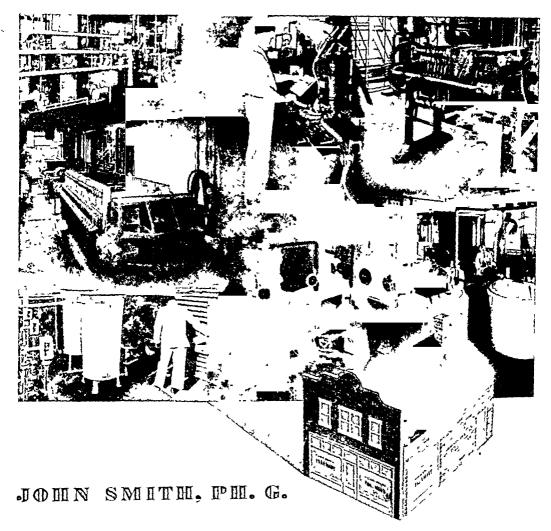

That the medical profession is weak on this point can be shown in two illustrations. First, you recall the amendment on standards that passed with the Soldiers' Wives Bill. We had no previous knowledge that this amendment was coming up. We were not warned beforehand. Not one single doctor wrote us, presumably because they didn't know about it either. But the chiropractors and the osteopaths knew about it. They went to their friends and urged the passage of this amendment. They had organized their forces and the amendment passed.

The second illustration is on the same subject. A congressman friend of mine told me this story. He voted against the amendment. Then later when he visited in his state, fifty-three quacks of all descriptions called him to complain about his action, but not one doctor remembered to thank him.

Please help us. Show us what you want us to do. I plead for unity, but not blind unity You must have a good program first.

It seems to us that Dr. Judd has said a great deal in a few words when he remarks, "If you can't change your Senator's mind, change your Senator!"

We have a great nation. We have come a long way but we cannot stop now to coast on yester-day's victories. We must go ahead, and the only way to reach a better harbor is to leave the harbor we are in now.

JOHN SMITH is one of the many highly-respected pharmacists of the Central West. His professional service, not only to physicians but to their patients as well, is unexcelled. His stocks are complete in every detail and, whether he makes it in his own laboratory or buys it from an outside source, the medicament prescribed is always promptly available.

As a matter of fact, Mr. Smith does make many preparations himself. But there are others which it is much more practicable to buy. For example, shortly after Mr. Smith opened his store in the early twenties, the medical press hegan to carry stories concerning a group of scientists in the East, who had found that the feeding of liver would produce new red blood cells. In a little while, Lilly medical service representatives were discussing liver extract with the medical profession.

#### Primary Atypical Pneumonia

On page 869 of this issue Drs. Norman S. Moore, Henry B. Wightman, and Edward D. Showacre of Cornell University, Ithaca, New York, report a statistical study of 196 cases of this disease variously known as primary atypical pneumonia, acute interstitial pneumonitis, virus pneumonia, acute influenzal pneumonia, or pneumonitis. Eighty-six cases of this disease had been previously reported in 1939 as acute interstitial pneumonia, from Cornell University by Smiley, Showacre, Lee, and Ferris.

The present cases represent those occurring in a population of 7,000 men and women, of whom 6,000 were students and 1,000 officers at the Naval Training Station at Cornell. Of their cases, the authors say:

During the six-year period since 1937, when the existence of the disease was first accepted at Cornell, we have seen a total of 354 cases of primary atypical pneumonia. The yearly incidence has varied from a low of 20 in 1940–1941 to 196 in 1942–1943. Until more is known about the cause and the means of spread we cannot account for this seasonal variation. Our experience in late 1943 would indicate a falling off in the number of cases for this year.

We realize that in reporting this series we are dealing with only the young adult group. In a university community this would, of necessity, be true. Dingle and Finland write: "The vast majority of the reported cases have occurred in adolescents and young adults."

The patient experienced a degree of disability in proportion to the severity of his illness. The patients with severe cases had a long hospital stay, had persistent rales in the chest after the x-ray showed that the lungs had cleared, and suffered considerable weight loss. It took at least two weeks for the weight to be regained....

Our experience differs from that of Van Ravenswany et al. While in our series there were no deaths and few complications and short convalescences were the rule, the report from Station Hospital, Jefferson Barracks, Missouri, includes several deaths, serious complications, and long convalescences....

The question of sulfonamide therapy is raised with each series of cases reported. It is now defi-

nitely established that sulfonamides have no influence on the disease itself, and in this we readily concur. In fact, the failure to react to sulfonamides should guide one in part in arriving at the diagnosis of atypical pneumonia....

We believe that there is an indication for sulfonamide therapy during the initial phase, before definite diagnosis of primary atypical pneumonia is established, and during the course of the disease if involvement from secondary organisms occur.....

The considerable temporary disability occurring among those afflicted has caused the Surgeon General to assign a special commission to study the disease, as to its cause and the clinical problem presented.

The cause has been suspected but not universally accepted; the clinical course has been repeatedly described, prognosis has been reported generally good, the treatment advocated has been largely symptomatic, and the complications encountered have been few....

The prolonged temporary disability involved would seem to be a matter of concern to industry also as considerable periods of hospitalization and loss of time are involved at a moment when manpower shortage is becoming increasingly acute.

In their second article in this issue the authors say: .

Radiographic studies, so far in the literature, have been confined to the description of a series of cases in a single epidemic and have differed considerably as to appearance, course, and complications. This may be explained by our observations of variation in x-ray pattern from one season to another and, at times, during the same season. This change in pattern may be due to a variation in virulence or in the type of virus, assuming that a virus is the causative agent.....

They then describe five types of x-ray patterns, and conclude that:

The radiographic appearance is characteristic but not diagnostic in the majority of cases. Similar patterns may arise from the inflammatory reaction to many irritants—virus, rickettsia, protozoa,

From the A.M.A. News of March 9, 1944. we learn:

In July, 1943, the National Physicians' Committee employed the largest opinion research group in this country to make a comprehensive study of the people's opinion about medical care. The results of that study have just been made available. . . . .

This is excellently summarized in the A.M.A. News:

The report should be of great help to medical leaders by pointing the way in planning for the extension of medical service. The report indicates the necessity for more education of the public regarding the issues involved in proposals for changing the nature of medical service. When people understand the issues, an overwhelming majority are unqualifiedly opposed to any such proposals as the Wagner-Murray-Dingell bill, which would establish federal control of medical practice. Even though the people sense the need for the extension of facilities designed to meet the costs of unusual or prolonged illness, only a small minority, as shown by this report, believe that compulsory sickness insurance would provide a satisfactory solution to the problem.

Many of the questions in this research concerned the personal experiences of the people with medical care as now provided in the United States. The replies, in great majority, indicated that the people are deeply conscious of the value of individualized service in the effectiveness of medical care, that they want complete freedom of choice in time of illness, and that they believe choice would be limited and restricted by administration of medical care under the auspices of the federal government.

Out of this report came the conviction that many persons find difficulty in meeting bills for unusual or prolonged illness and desire to participate in plans or methods for insurance against the hazards of emergency illness. Already great numbers of people are familiar with the various prepayment plans for medical service available throughout the country. The investigat ons extended into many communities in which such plans are operating and covered the experiences of the participants. To summarize the many questions asked on this phase of the report: Persons who participate in prepayment plans approve them; in every instance such persons believe they are better off than their neighbors who have no such opportunity; the doctors in areas where such plans are in operation believe that the people are better off because of the operation of the plan. More than 50 per cent of the doctors in such areas stated that it would be a good thing if all industries would operate prepayment medical and hospital service plans for their employees. . . . .

The information elicited by this survey. if intelligently used, should furnish material for calm and reasonable argument, and should surely stimulate efforts to provide

prepaid medical care. Apparently the American people do not favor a 6 per cent pay-roll deduction from wages for the federal government to provide medical care and hospitalization. "Only 8 per cent," says the report, "expressed the opinion that compulsory insurance would provide a satisfactory solution to the problem of payment for medical care costs; only 24 per cent thought it would be a good thing for the medical profession to be controlled by the national government."2

A majority of the people who participate in prepayment plans approve them, according to the report; in every instance such people believe they are better off than their neighbors who have no such opportunities. Where plans are in operation, over 50 per cent of the doctors approve them and over 50 per cent of the doctors believe "it would be a good thing if all industries in the nation would operate prepayment medical and hospital service plans for their employees."

Not only are the doctors opposed to the proposals for medical care and hospitalization of the Wagner-Murray-Dingell bill, but also the House of Delegates of the American Bar Association. The Association's report, in part:

Criticizes the proposed legislation because it is "prepared in a form which has become popular in the past ten years, being replete with involvement, cross references, new terminology, percentages, and other confusing matter," so that the chapter on socialized medicine leaves the reader in utter confusion as to its meaning. The distinguished lawyers who prepared this statement point out that "no one can estimate how much tax money is involved or how many people are covered" from the face of the

Since, however, the bill would propose to include every individual worker and since every family in the United States has at least one and one-half employed working members, the coverage would include practically every family in the United

The final paragraph of this report of the American Bar Association merits quotation and requotation as a fundamental appeal to the citizens of the United States to protect the Constitution. This statement

says: "The Constitution of the United States is designed to protect the citizens of this republic in the exercise of the rights of free men. The provisions of that instrument can be rendered impotent when our citizens, for the sake of an apparent immediate benefit, surrender to their government such direct

#### PRIMARY ATYPICAL PNEUMONIA, I\*

A Statistical Report of 196 Cases

NORMAN S. MOORE, M.D., HENRY B. WIGHTMAN, M.D., and EDWARD C. SHOWACRE, M.D., Ithaca, New York

IN 1939, under the title of "Acute Interstitial Pneumonitis," 86 cases of this "new disease entity" were reported from Cornell University. This condition was thought to be similar to that reported by Bowen from Hawaii in 1935, by Allen from Texas in 1936, and by Reimann from Philadelphia in 1938. All of these reports described a similar disease entity and emphasized the importance of the roentgenogram.

During the following years this disease received much attention. Its importance increased when many millions of young men were assembled in military camps, for it attacks young adults more frequently than other age groups. Because of the considerable temporary disability occurring among those afflicted, the disease has created much interest among the medical officers of the armed forces.5,6 The Surgeon General has assigned a special commission to study the cause as well as the clinical problem. Through the many reports on the subject a clinical picture of the disease is now well established. The cause has been suspected but not universally accepted;7 the clinical course has been repeatedly described, prognosis has been reported generally good, the treatment advocated has been largely symptomatic, and the complications encountered have been few 8

No one name for the disease syndrome has been accepted. Primary atypical pneumonia, acute interstitial pneumonitis, virus pneumonia, acute influenzal pneumonia, and pneumonitis are some of the names that have been used.

During the years 1935 and 1936 the possibility of a separate disease entity, apart from bronchopneumonia, was not entirely accepted by the attending staff at Cornell even though considerable x-ray evidence had accumulated during those years. By 1937, however, the term "pneumonitis" was employed for diagnostic record purposes at the Cornell Infirmary, and since that date the medical staff has been much interested in this new disease entity. The apparent prevalence of the disease in this locality contributed to the special interest. Our experience from 1937 to 1941, source volume being constant, may be summarized as follows: 1937-1938, 55

cases; 1938-1939, 39 cases; 1939-1940, 20 cases; 1940-1941, 21 cases; 1941-1942, 21 cases. During the twelve-month period between July 1, 1942, and July 1, 1943, a sharp rise in the incidence of the disease was noted. One hundred and ninety-six cases of primary atypical pneumonia occurring during that period were studied and provide the statistical data for this paper.

The cases represent those occurring in a population of 7,000 men and women comprised of 6,000 students and 1,000 officers at the Naval Training Station at Cornell. The statistical data of 196 cases are presented as follows:

Age.—The age is fairly uniform. The youngest patient was 16 and the oldest was 42 years. Only 12 per cent of the group was over 22 years, and this older group was made up essentially of older naval officers. The average age was 20.4 years.

Sex.—One hundred and sixty-three, or 84 per cent, were males, and 33, or 16 per cent, were females. The higher proportion of males is more significant than the figures show, for during the year the campus

population was 23 per cent female.

Months of Admission.—The series was started on July 1. During the course of the study a rapid rise in the incidence of cases was noted, which reached a peak in November and fell off in midwinter and spring. This may have been influenced in part by two weeks' University vacation in December, one week in May, and all of June. In July, 5 cases were admitted; in August, 15; in September, 13; in October, 38; in November, 53; in December, 22; in January, 19; in February, 14; in March, 7; in April, 5; in May, none; and in June, 5 (Fig. 1). During the first six months of the series (July to January) 146 cases, or 73 per cent of the series, occurred. This seasonal incidence conforms with the report from Camp Eustis. 5

Degree of Illness.—One must be guided in appraising the degree of illness by observations of the patient's temperature and the extent of lung involvement, together with toxic manifestations. Using these criteria, 115 patients, or 58 per cent, were classified as mild; 59, or 30 per cent, as moderate; and 22, or 11 per cent, as severe. There were no deaths.

Onset.—In 20 patients, or 10.2 per cent, the onset was sudden; that is, a matter of a few hours. In the majority of cases it was gradual. Fifty-eight patients said they had been ill for one day, 42 for two days, 34 for three days, 12 for four days, 11 for five days, etc.; 134, or 67 per cent, had been ill for three days or less. Cough with fever and malaise was frequent, both being present in 152, or 75 per cent, of the cases. Headache was the next most

A second paper on "Primary Atypical Pneumonia" by Drs. Moore, Wightman, and Showaere, subtitled "Observations of Radiographic Patterns," appears on page 672 of this issue.—Editor

fungi, bacteria, chemical fumes, or mechanical

Diagnosis is dependent upon correlation of history, clinical findings, radiographic evidence, and bacteriologic study.

The onset, development, and recession of the disease as revealed by serial films are its most distinctive roentgenographic features when differentiating primary atypical pneumonia from other pulmonary pathology.

We hope that this timely contribution to the scientific study of primary atypical pneumonia will receive the careful reading and attention it merits.

#### The Annual Meeting

On May 8-11, 1944, the Annual Meeting of the Medical Society of the State of New York will be held for the first time at the Hotel Pennsylvania, New York City. This is a last reminder for those who have so far neglected to make reservations, and a hope that the meeting will be attended by more people than ever before

The scientific program has been given much thoughtful attention by the section chairmen, with the result that section meetings this year will provide a wide variety of stimulating papers and discussions. Much attention is being paid to penicillin and its uses. Recent advances in the study of problems of infected wounds and the effect of treatment will be discussed at the general sessions, with Dr. D. Dexter Davis presiding, and the practical management of certain endocrine disorders will be presented by Dr. Lewis Hurxthal of the Department of Internal Medicine, The Lahey Clinic, Boston, Massachusetts, at the session on Thursday, May 11. .

Continuous caudal analgesia, the intensive treatment of syphilis, atypical pneumonias, problems of treatment of tropical diseases, penicillin treatment in sulfa-resistant cases of gonorrhea in the female, the interpretation of visual fields in the neurotic patient, anomalies of the speech mechanism, management of war amputations in a general hospital, and many other topics of current interest will be discussed in section meetings.

The session on the history of medicine will hear of the progress of medicine in New York City and the Negro physician; the history of public health in Cattaraugus, Chautauqua, and Allegany counties, and also a brief history of dermatology in New York City.

There will be no banquet this year, as last, nor, probably, for the duration, as a measure of cooperation by the Society with the government's program of conservation for war. But there will be an address by Vice-Admiral Ross T. McIntire, Surgeon General, U.S. N.

As we have said before, it is this year more than ever important for everyone to attend the Annual Meeting. The real hardships and shortages of this war are just now beginning to be felt. Responsibilities are being loaded upon the backs of those of us who serve at home as never before. They are being carried willingly; they must be carried efficiently, for to do more with fewer hands, better methods must be devised to conserve time and energy. Better methods of diagnosis and treatment are being constantly worked out, new modalities created. At the Annual Meeting all these things are brought to a focus for your convenience. No one in these days of crowded hours can hope to acquire this information by reading Nor can one obtain that impression of the trend of thought within the profession in the isolation of the office or even in the larger but yet insulated contacts in the hospital and the county society. Personal contact with one's friends and acquaintances in the profession is a good and necessary thing. To learn something is always good, but to cultivate a new friendship or to renew a neglected one is better.

Time marches on inexorably. Our young friends have departed somewhat from us, our older friends remain yet a while, mellowed by the years, strengthened by life itself, broadened by sorrow, needing your help to carry on yet another year. You will not fail them. You will not fail the You will brothers in the armed forces. come; you will learn much, laugh a little, help as you always have and always will to make the meeting a success and encourage others to carry on under increasing difficulties, with cheerfulness and renewed energy and courage.

previously stated, there were no deaths However, two factors seem to be evident. First, the signs of moisture occasionally persisted for weeks, and the fact that they were present was not an indication to keep the patient in bed or in the hospital. The accompanying cough during convalescence usually disappeared before the signs of moisture cleared Second, there was a feeling of weakness and easy fatigability which lasted for one to two weeks. One must take this into account when considering the time at which these patients are able to assume physical evercise. Weight loss, while prominent early in convalescence, was usually regained within two weeks after the fever subsided.

Treatment.—In general, the treatment was symptomatic. Cough mixtures and analgesics were commonly used. Occasionally steam inhalations made the patients more comfortable. Rest in bed and forced fluids were employed during the febrile period. On discharge from the hospital, modified duty was prescribed for both the civilian and the naval officer groups. Follow-up observations in the Outpatient Department enabled each patient to receive instructions regarding the time of his return to full duty, according to indications. Modified activity ranged from five to twenty days. The average time from hospital discharge to full duty was ten days.

#### Discussion

During the six-year period since 1937, when the existence of the disease was first accepted at Cornell, we have seen a total of 354 cases of primary atypical pneumonia. The yearly incidence has varied from a low of 20 in 1940–1941 to 196 in 1942–1943. Until more is known about the cause and the means of spread we cannot account for this seasonal variation. Our experience in late 1943 would indicate a falling off in the number of cases for this year.

We realize that in reporting this series we are dealing with only the young adult group. In a university community this would, of necessity, be true. Dingle and Finland's write: "The vast majority of the reported cases have occurred in adolescents and young adults."

The patient experienced a degree of disability in proportion to the severity of his illness. The

patients with severe cases had a long hospital stay, had persistent rales in the chest after the x-ray showed that the lungs had cleared, and suffered considerable weight loss. It took at least two weeks for the weight to be regained. In a few cases the cough and coarse rales persisted for weeks after discharge from the hospital. There was no case, however, in which it was felt that the signs in the chest and the volume of sputum would warrant the diagnosis of bronchiectasis. This may take months to develop and is a question that can only be answered in the future. However, we did not see it in our Outpatient Clinic months after recovery from the disease.

When studying the report from Camp Claibourne by Dingle et al.<sup>9</sup> we were impressed by a similarity in onset, in symptoms on admission, and in symptoms while in the hospital. Table 1 shows this similarity. Likewise, Table 2 lists distribution of lung pathology as shown by roentgen examination. Similarity between the two groups of cases is apparent, particularly in the high incidence of lower lobe involvement.

Our experience differs from that of van Ravenswaay et al.<sup>6</sup> While in our series there were no deaths and few complications and short convalescences were the rule, the report from Station Hospital, Jefferson Barracks, Missouri, includes several deaths, serious complications, and long convalescences. The experiences of others<sup>5,5,9</sup> follow our own more closely.

The question of sulfonamide therapy is raised with each series of cases reported. It is now definitely established that sulfonamides have no influence on the disease itself, and in this we readily concur. In fact, the failure to react to sulfonamides should guide one in part in arriving at the diagnosis of atypical pneumonia. We do feel that secondary invaders play an important role in certain cases in which there is a secondary rise in temperature which cannot be justified by a spread of the pneumonia involve-

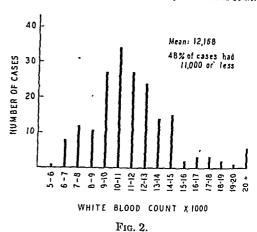

F1G. 1.

common symptom from the onset, being present in 57 per cent of the cases; 43 patients, or 22 per cent, had a sore throat; and 31, or 16 per cent, complained of a preceding cold. A few reported chills, but this was chilliness rather than shaking and rigor. A moderate grade of malaise was the rule.

Symptoms While in the Hospital.-Cough was the most consistent symptom, occurring in 179, or 90 per cent, of the cases. Headache occurred in 40 per cent, profuse sweating in 21 per cent, and sore throat in 16 per cent. Fifty cases, or 25 per cent, had some form of upper respiratory congestion; that is, a discharging or obstructed nose or a feeling of fullness in the head. The cough was of the dry, nonproductive type at the onset, gradually changing to the productive type as the disease progressed and the signs of moisture became evident in the chest. Appetite was poor during the fever phase. Weakness and lassitude were the rule, although the patients did not appear acutely ill. It was noteworthy that even when the patients were running a high temperature and had considerable lung involvement they were not toxic, were readily amused, and were interested in their surroundings and the activities of their ward mates.

Duration of Fever,-The hospital fever averaged 5.94 days, varying from no days to twenty. If the estimated prehospital fever is included, the average is nine days; 64 per cent had a fever for less than ten days.

Pleural Involvement and Other Complications.—As indicated by complaints of localized chest pain, or on the basis of x-ray evidence, pleurisy was present in 20 cases. In only one case was a pleural rub heard. Effusion in the mediastinal pleural space developed in one case. Drainage was not required and a residual adhesion from mediastinal pleura to diaphragm was present four weeks after all evidence of fluid had disappeared. A small effusion may have been present in 2 cases; both cleared without diagnostic or therapeutic drainage. One case of sinusitis developed. Two patients with an old history of asthma had a recurrence of asthma. There was one case of a severe, bilateral femoral thrombophlebitis. No otitis, tonsilitis, or empyema was noted.

Temperature Curves .- An irregular, peaked temperature curve was observed in all moderate and severe cases. In the mild ones the temperature dropped abruptly after one to two days and remained normal. Elevation of temperature in the early morning occurred in 38 cases. There were peaks, however, at various other times of the day in an equal number of individuals.

Blood Counts.-White blood counts were done on all but 6 patients. Only the highest count from each case was included. The counts varied from a low of 5,000 to a high of 25,000. There was one patient with a white blood count of 5,000-6,000; 8 with 6,000-7,000; 12 with 7,000-8,000; 27 with 9,000-10,000; 34 with 10,000-11,000 up to 20,000, the average being 12,168. Forty-eight per cent of the cases had a count of 11,000 or under (Fig. 2).

Total Days in Hospital.-Hospital days varied from three to twenty in the series. The average was twelve days.

Days on Which Signs Were First Heard .- In a selected group of 60 patients particular attention was given to the time of onset of lung signs. In 10 per cent of this group the signs were evident on the second day, in 15 per cent on the third day, in 15 per cent on the fourth day, in 17 per cent on the fifth day, in 7 per cent on the sixth. Sixty-six per cent of the patients had signs evident during the first week; the other 34 per cent took more than a week for the signs to develop.

X-Ray Evidence.—A chest radiograph was taken of all patients and no case is included which did not show specific x-ray evidence. The left lower lobe alone was involved in 82 cases, or 43 per cent. The right lower lobe alone was involved in 66 cases, or 34 per cent. Both lower lobes were involved singly or together in 84 per cent of the cases. The right upper lobe area was involved in 12 cases, the left upper in 5, the right middle lobe area in 2 cases, the whole right lung in 2, the whole left lung in 4; other combinations were present in 10 cases. The lower lobes were involved most frequently, the left more often than the right.

Prognosis.-Prognosis was found to be good, with complete clearing of the lung eventually. As

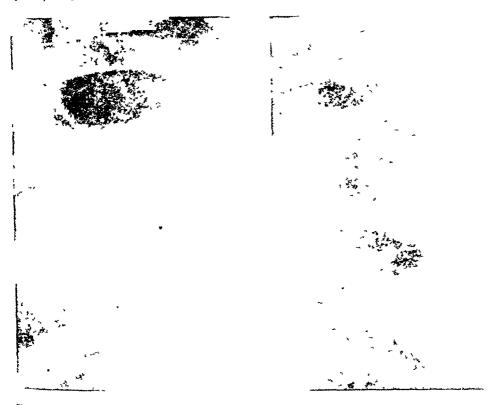

Fig. 1. Fan developing from hilum containing numerous soft nodules in hazy background

Fig 2. Portion of lung field showing scattered small, soft nodules and several larger patchy or soft nodular areas

thirty-six to seventy-two hours generally rerealed pathologic shadows. Seldom were these shadows maximum for the individual case, but, on the contrary, spread in area, became denser or became confluent. In rare instances, initial shadows were noted after seventy-two hours. One case in our series developed evidence of the disease on the seventh day. (3) The initial \ray taken after a neek or ten days of illness generally showed pathology to be at its maximum or receding. Exceptions were cases showing spreads when the maximum area involved was not reached for two or three weeks.

#### Variety of X-Ray Patterns

We have, so far, been able to distinguish a number of patterns when the primary film has been taken from twelve to seventy-two hours of ouset.

The Common Type.—This pattern occurs most frequently and, in our experience, was present in one-half the cases. It is characterized by increase in hilar density, swelling of the larger trunk branch shadows, and the presence of finer branch shadows which are normally not visible. These linear shadows are soon obscured but not obliterated by a veil of haze, the entire area forming a fan or band extending from the hilum into the adjacent lung irrespective of lobe margins. The fan is less dense toward its periphery and gradually merges into the normal lung pattern. An infrequent variation is the development of a homogeneous hazy fan with no definite change in the underlying linear markings.

The Nodular Type.—(1) The fine nodular type is essentially the preceding pattern plus scattered denser, soft nodular areas. It presents soft nodules (2 to 4 mm.) usually filling a section of lobe or lobes and associated with swelling of the trunk branch shadows, an increase in the finer pulmonic markings, general haziness of the entire involved area, and an appearance of tubercle formation. These minute spots may be so faintly outlined that a high speed exposure with later study of the film under a hand lens may be necessary to demonstrate them in their hazy background. They are best visualized in the margin of a fan since the denser central portion tends to obliterate them. Their occurrence in our series was quite variable, being uncommon

ment. We feel that the sulfonamides have an effect, even in low dosage, in controlling the pathogens of the respiratory tract. This is based on the work of Cecil, Plummer, and Smillie<sup>10</sup> and on our own experience. Throat and sputum cultures should be retaken if there is evidence of additional infection. Sulfonamides. in our opinion, are indicated at this time and seem to have a definite effect in reducing the subsequent complications of the disease. Also, we feel that their use is justified in a patient who appears acutely ill on admission, before the pneumonia has been classified. Not infrequently. in our experience, has the result of sulfonamide therapy contributed strong evidence in support of a pneumococcus pneumonia before the organism was obtained from sputum or blood. We are of the opinion that to do otherwise might deny a worthy patient the use of sulfonamide while one is waiting for cultural studies to determine the causative factor.

#### Summary

1. The yearly incidence of primary atypical pneumonia at Cornell University is reviewed from 1937 to 1943.

2. One hundred and ninety-six cases of primary atypical pneumonia occurring in the year 1942-1943 are studied statistically from the standpoint of age, sex, month of admission, degree of illness, symptoms at onset and while in the hospital, duration of fever, hospital days, blood counts, prognosis, and x-ray location.

3. We believe that there is an indication for sulfonamide therapy during the initial phase, before definite diagnosis of primary atypical pneumonia is established, and during the course of the disease if involvement from secondary

organisms occurs.

#### PRIMARY ATYPICAL PNEUMONIA, II

Observations of Radiographic Patterns

EDWARD C. SHOWACRE, M.D., HENRY B. WIGHTMAN, M.D., and NORMAN S. MOORE, M.D., Ithaca, New York

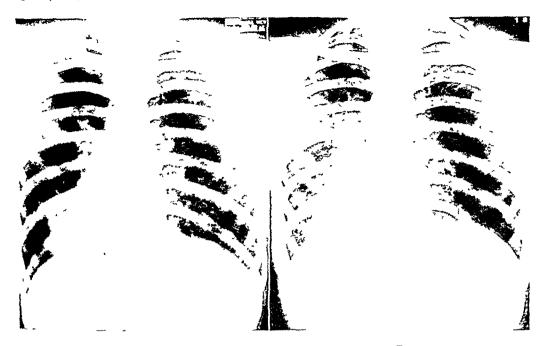

UR first experience with primary atypical pneumonia began in 1935 with one of us (E. C. S.), when several cases of mild and unusual lung infections were noted at the Cornell University Infirmary. These pneumonias did not fit any known classification in existence at that time and, after considerable staff discussion, the term "acute interstitial pneumonitis" was finally adopted in 1937 as the official hospital diagnosis. This name evolved from the previous use of "acute pneumonitis," a term used by Bowen1 in 1935 and by Allen<sup>2</sup> in 1936, together with our impression that the tissue reaction was in the interstitial structures of the lung along the bronchovascular trunk branches. This term was subsequently changed to "virus pneumonia" and more recently to "primary atypical pneumonia" in order to conform to common usage.

Radiographic studies, so far in the literature, have been confined to the description of a series of cases in a single epidemic and have differed

considerably as to appearance, course, and complications. This may be explained by our observations of variation in x-ray pattern from one season to another and, at times, during the same This change in pattern may be due to a season. variation in virulence or in the type of virus, assuming that a virus is the causative agent.

The appearance in the initial film will depend on the length of time elapsed since the onset of the disease. By onset we mean the date of the earliest symptoms as elicited by the history and not from the time of medical consultation or hospital admission. (1) Films taken within thirtysix hours of onset have usually shown no definite pathology. This has been particularly true of those patients whose illness had a gradual onset, the greater number of whom do not seek medical attention within twenty-four to thirty-six hours. Lung densities, when they appeared within this time, were more frequent among those with an abrupt influenzal type of onset. The practical importance of this observation is that an early film, read as a negative, does not rule out developing atypical pneumonia. (2) Films taken from

soft-edged appearance of an acute infection but appeared subacute in a few instances, or even resembled the residual fibrosis of an old, burned-out infection in others. Rapid change within a few days quickly established the true status of this infiltration (Fig. 7).

## Spread or Development to Maximum Extent

We have observed three varieties of spread: the continuous, the unit, and the explosive types.

The continuous type of spread is characterized by marginal enlargement of the original area of infiltration during the first few days after onset. It is comparable to an inflammatory process gradually reaching maximum proportions, rather than a true spread in the sense of a fresh or new area of infection (Fig. 3). This enlargement of the early lesion is not usually associated with exacerbation of the clinical course.

The unit type of spread is characterized by the formation of a fan or band which remains relatively constant as a unit for a few days and re-

cedes, but while clearing is followed by the development of another fan as a separate unit. The final film in a series of x-rays from a single case may, therefore, show several fans in various stages of development and recession in both lung fields (Fig. 5). The development of each fresh unit is ordinarily accompanied by clinical evidence of relapse.

The evplosive spread is indicated by the development of an initial lesion and the ensuing sudden, generalized involvement of the remainder of the lung or large areas of both lungs after a few days.

This spread of infection, in our experience, was invariably manifested by generalized soft swelling of the linear markings with scattered areas of patchy or soft nodular zones of infiltration and never by a homogeneous increase in density. Patients showing this type of spread, in our experience, have been very ill, often cyanotic, and occasionally required oxygen. These cases are apt to run a protracted clinical course (Fig. 6).

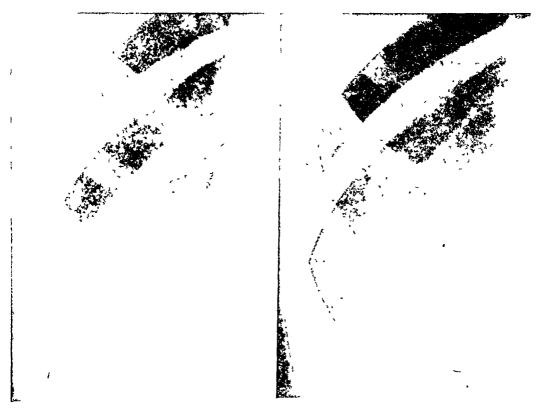

Fig. 7. A—Homogeneous zone of increased density in left base with enlarged trunk shadows leading from hilum. B—Six days later: pseudo-fibrotic interstitial infiltration frequently seen during resolution. In rare instances, beginning infiltration may have this same appearance

during some years and frequent during others. (2) The large nodular pattern, again, is basically the common type plus scattered soft nodules or patches (2 to 4 cm.) and has the appearance of a lobular pneumonia. A variable number of finer spots or nodules are usually associated with the larger ones. This type of infiltration was infrequent in early fans, but was the predominating pattern in the secondary areas of a spread (Figs. 1 and 2).

The Reverse Fan Type.—This type was next in order of frequency among our cases and was evidenced by a small area of infiltration developing in the outer portion of the lung field or in the cardio- or costophrenic angles, spreading back to the hilum to form a fan or band (Fig. 3). A variation occurred when these initial areas failed to extend and hence failed to connect with the hilum except by swollen trunk shadows (Fig. 7).

The Hilar Type.—Our criterion of hilar infection is increase in density, obscuring the hilar structures on one or both sides and not involving the adjacent lung field. This diagnosis is diffi-

cult and often impossible without comparative films. We were fortunate many times in being able to compare the initial film with the routine entrance physical examination film of the student and then to follow the recession by serial roent-genograms.

Unusual Types—(1) One per cent of our cases developed lobar consolidation. They began as partial infiltration and gradually spread through the remainder of the lobe (Fig. 4). (2) Apparent atelectasis, as evidenced by lobe contraction and elevation of the diaphragm, was rarely noted and the complete picture of lobe contraction, elevated diaphragm, mediastinal shift, and rib retraction was not encountered by us in atypical pneumonia. Fleishner lines, denoting residual atelectatic areas, have been noted in the bases of resolving cases in from one to two per cent of our atypical pneumonias.3 An early film showing productiveappearing infiltration, though infrequently encountered, is especially worthy of note. The first film showed, along the normal linear shadows, an irregular thickening which did not have the

toms and extent of the x-ray involvement cannot be expected to always coincide. At times, cases with a small area of involvement in some portion of the lung showed marked toxicity and others, with extensive areas of infiltration, did not appear very ill. Clinical improvement has been noted in the face of an apparent x-ray spread.

Walking cases among individuals were not The incidence was high among those reporting a persistent cough or a feeling of unusual weakness, following what they thought to be an ordinary grippy cold. A few such cases were found on ordinary routine physical examination.

#### X-Ray and Physical Findings

X-ray and physical findings did not coincide in a high percentage of the cases as is the usual experience of others. The exudative-appearing types were readily found and the central interstitial patterns were apt to be silent. In some instances, moist rales persisted for a few days to several weeks after the x-ray was negative and, in many others, radiographic evidence of residual interstitial thickening persisted after all physical signs had cleared. Occasionally a case was seen which presented the clinical course of an atypical pneumonia with physical signs of a bronchitis and with no definite lung infiltrate visible on repeated radiographs.

#### The X-Ray and Lung Pathology

Extensive pathologic study of atypical pneumonia has been impossible because of the rarity of postmortem material. However, during the past few years a sufficient number of reports from scattered cases have accumulated to give us a fair idea of the lung changes in the severer types of infection.

There has been considerable speculation as to the exact nature of the pathology in the mild, common type of case with the hazy overlay of the widened trunk shadows. The majority opinion, and it must be opinion, since no pathologic material is available, is that an edematous exudate is present; others think that atelectasis must be strongly considered as a factor.5 The basis for the nodular or patchy type of x-ray pattern is much clearer, for we now have definite reports of marked inflammation of the bronchial mucosa, infiltration and necrosis of the bronchial walls, peribronchial and perivascular infiltration, and edematous exudation into the alveoli. Small,

nodular infiltrations around the terminal bronchioles are commonly noted. Polymorphonuclear cells are abundant in the bronchi but not in the alveoli, where the mononuclear type dominates the picture. The large numbers of mononuclear cells arranged around the margins of the alveoli are considered by many as characteristic of this type of pneumonia. It is interesting to note that the particular combination of mononuclear cellular infiltration with the formation of fine peribronchiolar nodules has been frequently described during the past half century in association with bronchopneumonias secondary to viral infections in general, measles and influenza in particular.6-11

#### Summary and Conclusions

A résumé of nine years radiographic observation of primary atypical pneumonia is presented, describing original patterns, modes of spread, and methods of clearing. Experience in studying this disease through various outbreaks during the same year and during different years has led us to draw certain conclusions, namely:

- 1. The radiographic appearance is characteristic but not diagnostic in the majority of cases. Somewhat similar patterns may arise from the inflammatory reaction to many irritants-virus, rickettsia, protozoa, fungi, bacteria. chemical fumes, or mechanical agents.
- Diagnosis is dependent upon correlation of history, clinical findings, radiographic evidence, and bacteriologic study.
- 3. The onset, development, and recession of the disease as revealed by serial films are its most distinctive roentgenographic features when differentiating primary atypical pneumonia from other pulmonary pathology.

#### Recession or Clearing

Our cases presented two distinct methods of clearing: (1) Many of the single homogeneous fans became progressively less dense and disappeared within a week from beginning resolution. (2) All of the nodular and some of the homogeneous density types gradually lost their soft appearance as the acuity of infection subsided, developing into a more organized-appearing infiltrate (Fig. 7). This pseudofibrotic infiltration was either linear or finely nodular or consisted of small irregular deposits. These deposits, in turn, were frequently observed to be aggregates of minute nodules. Complete resolution usually required from one to two weeks. The longest time observed by us from beginning of resolution to complete clearing was ten weeks.

A case first found during this stage might readıly be labeled chronic lung disease unless diagnosis is reserved for several weeks. This problem arises where large numbers of routine physical examinations are being done. History of grippe or a cold with cough during the past month or so leads one to suspect that these shadows represent the clearing stage of an atypical pneumonia; later x-ray confirms it (Fig. 8).

#### Complications

Reports concerning pulmonary complications

have been rather inconsistent. Many observers have seen no complications while others have reported considerable severe complicating pleuritis. We have seen a variation in pleural complications; none during some seasons and about 2 to 3 per cent in others. The pleural involvement was confined with equal frequency to small collections of fluid or pleural thickening in the costophrenic angle or to localized effusions in the various fissures. These fissure effusions, when between the upper and lower or middle and lower lobes, resemble a light, hazy, uniform lung infiltration but are much more persistent. We feel that such a shadow, persisting for a week without change, warrants a lateral or oblique view (Fig. 9).

A few relapses were noted after the disappearance of the lung shadows and apparent clinical recovery. They presented recurrence of clinical findings with reappearance of radiographic density in the original area involved. The recovery course was similar to that of the original attack.

## X-Ray and Toxicity of the Patient

Obviously, a radiograph cannot reveal extensive infection before definite inflammatory reaction has occurred; neither can it determine virulence of the infective agent nor the resistance of the patient. Hence the severity of the symptoms and extent of the x-ray involvement cannot be expected to always coincide. At times, cases with a small area of involvement in some portion of the lung showed marked toxicity and others, with extensive areas of infiltration, did not appear very ill. Clinical improvement has been noted in the face of an apparent x-ray spread.

Walking cases among individuals were not uncommon. The incidence was high among those reporting a persistent cough or a feeling of unusual weakness, following what they thought to be an ordinary grippy cold. A few such cases were found on ordinary routine physical examination.

#### X-Ray and Physical Findings

X-ray and physical findings did not coincide in a high percentage of the cases as is the usual experience of others. The exudative-appearing types were readily found and the central interstitial patterns were apt to be silent. In some instances, moist rales persisted for a few days to several weeks after the x-ray was negative and, in many others, radiographic evidence of residual interstitial thickening persisted after all physical signs had cleared. Occasionally a case was seen which presented the clinical course of an atypical pneumonia with physical signs of a bronchitis and with no definite lung infiltrate visible on repeated radiographs.

#### The X-Ray and Lung Pathology

Extensive pathologic study of atypical pneumonia has been impossible because of the rarity of postmortem material. However, during the past few years a sufficient number of reports from scattered cases have accumulated to give us a fair idea of the lung changes in the severer types of infection.

There has been considerable speculation as to the exact nature of the pathology in the mild, common type of case with the hazy overlay of the widened trunk shadows. The majority opinion, and it must be opinion, since no pathologic matetial is available, is that an edematous exudate is present; others think that atelectasis must be strongly considered as a factor.5 The basis for the nodular or patchy type of x-ray pattern is much clearer, for we now have definite reports of marked inflammation of the bronchial mucosa, infiltration and necrosis of the bronchial walls, peribronchial and perivascular infiltration, and edematous exudation into the alveoli. Small,

nodular infiltrations around the terminal bronchioles are commonly noted. Polymorphonuclear cells are abundant in the bronchi but not in the alveoli, where the mononuclear type dominates the picture. The large numbers of mononuclear cells arranged around the margins of the alveoli are considered by many as characteristic of this type of pneumonia. It is interesting to note that the particular combination of mononuclear cellular infiltration with the formation of fine peribronchiolar nodules has been frequently described during the past half century in association with bronchopneumonias secondary to viral infections in general, measles and influenza in particular.6-11

#### Summary and Conclusions

A résumé of nine years radiographic observation of primary atypical pneumonia is presented. describing original patterns, modes of spread, and methods of clearing. Experience in studying this disease through various outbreaks during the same year and during different years has led us to draw certain conclusions, namely:

1. The radiographic appearance is characteristic but not diagnostic in the majority of cases. Somewhat similar patterns may arise from the inflammatory reaction to many irritants-virus, rickettsia, protozoa, fungi, bacteria, chemical fumes, or mechanical agents.

2. Diagnosis is dependent upon correlation of history, clinical findings, radiographic evidence,

and bacteriologic study.

The onset, development, and recession of the disease as revealed by serial films are its most distinctive roentgenographic features when differentiating primary atypical pneumonia from other pulmonary pathology.

#### CANCER REPORTING IN NEW YORK STATE

Morton L. Levin, M.D., Dr.P.H., Albany

ANCER reporting in upstate New York began on January 1, 1940, following legislation enacted in accordance with recommendations made by the State Legislative Cancer Survey Commission1 in its "Final Report" of February, 1939. These recommendations had previously received the endorsement of the Medical Society of the State of New York, through its Council. Thus from its inception cancer-morbidity reporting in New York State has had the active support of the medical profession.

The first step taken to institute reporting was to inform, by letter, each physician, hospital superintendent, and director of a pathologic laboratory of the provisions of the reporting law, which states that hospital and laboratory authorities as well as physicians shall report any case of cancer or other malignant tumor which comes to their notice. The reporting form was made as simple as possible; the information called for includes the patient's name, address, age, sex, color, marital status, the date of onset, the clinical and pathologic diagnosis, and the stage of disease. Pathologic laboratories were permitted to report by means of a carbon copy of the report which they would ordinarily make to the physician or for the hospital record. This greatly facilitated reporting by the laboratories, most of which have insufficient clerical help to make out separate cancer reports.

During the first year of cancer reporting Dr. Louis C. Kress, Director of the Division of Cancer Control, spoke before each meeting of the various District Branches of the Medical Society throughout the State, describing the system of cancer reporting and the purposes it was designed to serve. The fact that cancer reports are handled as confidential communications was emphasized.

The steps taken to inform the physicians and to obtain their active support are stressed because physician cooperation is essential to the success of any new type of morbidity reporting. The results in New York State, judged from the volume of total reports, the number of new cases reported, and the ratio of cases to deaths justify this view and indicate that cancer reporting has had the continued support of the physicians of the State.

Presented before the Cancer Symposium, in association with the Seventy-Second Annual Meeting of the American Public Health Association, New York City, October 11, 1943.
Assistant Director, Division of Cancer Control, New York
State Department of Health.

As would be expected in the reporting of any chronic disease, the largest number of reports was received during the first year (as will be seen from Table 1). The number of reports of "new" cases (that is, those reported for the first time) has decreased each year by approximately 20 per cent; this decrease is expected to continue until the number of new cases is stabilized at a level approximating the number of deaths plus the number of cured cases. In 1942, the third year of reporting, the number of new cases reported exceeded the number of deaths by 36 per cent.

#### Completeness of Reporting

Probably the most severe criterion of the completeness of cancer reporting is the percentage of deaths which have been reported previously as cases. This is a severe test because many cases of cancer are not correctly diagnosed until after death or shortly before death. The autopsy studies of Pohlen and Emerson<sup>2</sup> indicate that in certain classes of hospitalized patients as many as 20 per cent of cancer cases may be unrecognized clinically. Obviously such cases would not be reported prior to death. The percentage of cancer deaths previously reported was 55 per cent during the first year of reporting and now varies from 55 to 63 per cent. In two-thirds of the remaining unreported deaths a separate case report is received after death. These are of value because often they contain more accurate data than that obtainable from the death certificate. A case report is thus obtained for almost 90 per cent of all deaths from cancer in the State. Judged in this way, the completeness of cancer reporting compares favorably with that of other diseases which have been reportable for a much longer time.

#### Cancer Prevalence

The total number of known individuals with cancer alive at some time in 1942, as indicated by reporting during 1940-1942, was 35,378, giving an annual prevalence rate of 579 cases per 100,000 population. This is 3.6 times the mortality rate (Table 2). It will be recalled that usually an estimate of cancer prevalence is based on a ratio of 3 cases per death. Allowing for incompleteness of morbidity reporting, these figures for New York State indicate that this ratio is probably too low, and that prevalence may be four or five times as great as mortality. Estimates of prevalence based on mortality are

Table 1.—Cancer Reporting in New York State, Exclusive of New York City—Number of Reports and New Cases

			Reports per
Year	New Cases	All Reports	New Case
1940	. 20,792	41,783	2.0
1941	. 16.231	32,304	2.0
1942	13,391	24,737	1.8

used extensively to gage the extent of the cancer problem in terms of living cases. For example, recently in a New York State Health District, the District Health Officer had occasion to estimate the number of nurses needed to provide home nursing care for cancer patients in his district. Since nursing care varies with the type of cancer, one of the factors entering the health officer's estimate was the number of cases of each type of cancer which would be expected to occur in the district. Reference to Table 2 will show how greatly the ratio of living cases to deaths varies by site of cancer. According to these figures, for each death from skin or lip cancer there are 30 living cases; from breast and uterine cancer there are 5 cases; from cancer of the stomach and intestines, fewer than 2 cases; and from lung cancer, one case.

Information of this kind makes possible more accurate estimates regarding the extent of cancer as a health problem in terms of living patients having various forms of cancer. These figures indicate that the types of cancer which will be encountered most frequently in any program directed toward living cases will be in the following order: cancer of the skin, the breast, the uterus, the stomach, and the intestines. Among men the five most frequent sites, in order of decreasing prevalence (rather than mortality), are the skin, the prostate, the stomach, the lip, and the lower intestinal tract. Among women, the breast, the uterus, the skin, and the upper and lower intestinal tract are the most frequent sites, in decreasing order.

#### Duplication of Reports.

, 1

;

4

4

ŧ

;

į

Many physicians interested in cancer morbidity data were apprehensive lest duplicate reports on the same patient would be counted as separate cases. Duplication of reports is to be expected, since a patient may be treated by more than one physician, or may have several hospital admissions or more than one biopsy. An average of two reports for each new case was received during the first two years of reporting; the number has decreased slightly since then (Table 1). To prevent counting duplicate reports twice, each new case report as it is received is checked against a master file of all previously reported cases to determine whether or not it is a duplicate report.

Diagnosis classification in this column is as stated on the death certificate.

Reference to Table 3 shows that approximately half of the first reports are made by physicians and 40 per cent by hospitals. Second or duplicate reports come chiefly from hospitals and labora-The second report often supplements the first and furnishes more accurate or additional information. At the end of the year all reports on the same patient are combined and the pooled information is punched on a master punch card for filing and tabulation in the state wide cancer roster at Albany.

#### Cancer Rosters

In addition to the state-wide cancer roster or register, a cancer roster is maintained in upstate New York by each city department of health, each county department of health, and in nineteen of the twenty district state health offices throughout the State. The one district omitted is that covering the area surrounding New York City, which is served by full-time county and

city health departments. Thus in each area served by a local health unit, whether district, county, or city, there exists a current cancer register for use in connection with whatever cancer activities may concern the local health agency.

These local cancer rosters are inter-related. If a patient moves from one district to another, or if a patient living in one district attends a clinic or is admitted to a hospital in another district, the system of reporting records this fact in both cancer rosters. Through the central cancer roster in Albany, information regarding a patient listed in any local roster is made available to any other district which may be interested in the same patient.\*

#### Discussion

The two questions regarding cancer reporting which are probably of greatest interest to those engaged in cancer control are: first—is cancer reporting useful, and, second—is it practical or workable?

As has been indicated, the practicability of cancer reporting depends principally upon the cooperation of the medical profession. In addition, special efforts must be made to obtain case reports from hospitals, laboratories, and physicians who, for one or another reason, fail to report their cases.

The usefulness of cancer reporting, assuming that a large proportion of cases will be reported, depends in part on the type of cancer control program in operation and the facilities at the disposal of this program. In a program devoted largely to public education, for example, cancer reporting would serve chiefly two functions: first, to furnish statistical information regarding cancer morbidity in various localities; second, to furnish information regarding progress in cancer control as indicated by the stage of the disease and the cure rates in each local area. If the control program involves active aid to or interest in tumor clinics, cancer reporting can be made to serve an important function in the operation of such clinics. If the control program includes some type of nursing or follow-up service in the patient's home, reporting may be highly useful in the efficient administration of such a service.

The utilization of cancer reports as a basis for epidemiologic or clinical investigations is a field bounded almost solely by the ingenuity and the resources of the investigator.

#### Uses of Cancer Reporting in New York State

In the New York State cancer program, cancer reporting has proved to be of value in each of the ways outlined hereinbefore.

In epidemiologic research, cancer reports are providing basic information which will make it possible to measure progress in early diagnosis and reduction of mortality. From 1940 on, reporting made possible the measurement of trends in mortality on the basis of accurately diagnosed cases, as distinct from other cases. It will be possible to estimate the cure rates of different types of cancer in different age groups in different sections of the State and in different population segments.

We believe the outstanding epidemiologic problem in cancer to be the discovery of groups which are exposed to increased risk of developing cancer. For such research, detailed histories are usually necessary. Cancer reports, however, can be used as a basis for obtaining such histories in a random sample of reported cases, eliminating whatever selective factors might operate if only hospital cases were utilized. The correlation of cancer reports with other morbidity and mortality data routinely received by a health department also offers interesting possibilities for research. For example, by comparing reported cancer cases with the state-wide file of previously reported syphilis cases, there appeared an unexpected correlation between syphilis and cancer of the cervix.3 Such an observation points the way for further investigation, especially along the lines of case finding. Obviously, research in the epidemiology of cancer can be made on various types of data, of which cancer reports are only one.

From the standpoint of public education, the most useful contribution of cancer reporting has been that it enables us to base our facts and figures on living cases rather than on deaths. A second point of value is that speakers in a particular community can refer to the data for that locality. News reports based on local case incidence are more readily accepted by the press and receive greater attention from the public. Physicians lecturing before medical meetings also make use of the information on the incidence of various types of cancer in preparing their material.

A valuable further use of the cancer roster is in helping tumor clinics to maintain a follow-up system. Complete follow-up of cancer patients is essential for the evaluation of therapy, as well as for proper health supervision of patients. Most clinics experience great difficulty in tracing all their patients. The cancer roster, through its

<sup>\*</sup> It is a pleasure to acknowledge here the work of Miss Frances King, formerly supervisor of Local Health Records, New York State Department of Health, whose early interest in the office organization of the cancer rosters contributed greatly to their efficient functioning.

correlation with mortality records, makes it possible to inform a clinic of the death of any of its patients in or outside the state, thereby eliminating unnecessary attempts at follow-up in such cases. The roster also enables one clinic to ascertain whether a patient has come under the care of another clinic, physician, or hospital anywhere in the State and to obtain the benefit of the observations of the latest physician who sees the patient, as recorded on the cancer case report. This latter use of the roster, of course. must be such as not to violate the confidential character of cancer reports, prescribed by law.

Probably the most important administrative function of cancer reporting is its use in connection with nursing service to cancer patients. The need for home nursing care of cancer patients is generally recognized. In several counties and districts of the State, cancer reports are routinely used in the same manner that other morbidity reports have been used in the past-as a means of determining whether nursing service is needed and desired, and, if it is, what type of service should be rendered. The system of cancer reporting also makes it possible to remind the physician of the availability of the nursing service at a time when he is most interested—i.e., when he has a patient who may need it. extension of nursing service to cancer patients has been considerably hampered by the shortage of nurses caused by the war. On the other hand, the need for such service for cancer patients has increased. Cancer reporting has greatly aided in the efficient utilization of such public health nursing facilities for cancer patients as are avail-

#### Summary and Conclusion

In summary, our experience with cancer reporting in New York State indicates that reporting is practicable in areas where the medical profession is informed about and sympathetic with the aims of reporting and the cancer program in general. The completeness of cancer reporting compares favorably with that of other reportable diseases. Cancer reporting has proved usefulfirst, in providing material for epidemiologic investigation and for evaluation of progress in cancer control: second, in public education; third, in professional education; fourth, in aiding the follow-up of cancer patients: and, fifth, in the administration of public health nursing service to cancer patients.

#### APRIL—CANCER CONTROL MONTH

By proclamation of the President, as authorized by Congress, the month of April will again be observed as Cancer Control Month throughout the United States. During this time, the Women's Field Army of the American Society for the Control of Cancer will applied a intensive petiton-wide of Cancer will conduct an intensive nation-wide educational campaign against a disease which is one of the most ruthless killers on the homefront.

Tens of thousands of persons in the United States die needlessly from cancer each year because they put off a visit to their physician after they have discovered telltale signs. Delay makes cancer the second highest cause of death in the United States.

With every tick of the clock, the Women's Field Army is spreading knowledge, given to them by the medical profession, which will help to guard themselved selves, their families, and their friends against this

More and more people are learning that time is the crucial factor in cancer control and are being treated when the disease is still localized and susceptible to complete removal or destruction. The Women's Field Army in some areas also gives direct help to the medical profession throughout the year by making surgical dressings and bandages for needy cancer patients and by helping them to obtain diagnosis and treatment.

Both men and women are asked to enroll in this organization and to participate actively in its

Enlistments may be arranged through local units of the Women's Field Army or through the American Society for the Control of Cancer, Incorporated, 350 Madison Avenue, New York 17. New York .--Health News

#### ACADEMY ANNOUNCES 1944 GRADUATE FORTNIGHT

The annual Graduate Fortnight of the New York Academy of Medicine will take place October 9-20, on the subject, "Infections and Their Treatment."

Special emphasis will be placed upon the more recent chemotherapeutic agents.

The Fortnight, as in the past, will include morning panel discussions, afternoon hospital clinics, evening lectures, and pathologic demonstrations. There will also be a scientific exhibit, including the more recent pharmaceuticals and an appropriate library exhibit.

For information and registration, address the Secretary, Committee on Medical Education of The New York Academy of Medicine, 2 East 103rd Street, New York 29, New York.

city health departments. Thus in each area served by a local health unit, whether district, county, or city, there exists a current cancer register for use in connection with whatever cancer activities may concern the local health agency.

The utilization of cancer reports as a basis for epidemiologic or clinical investigations is a field bounded almost solely by the ingenuity and the resources of the investigator.

#### Uses of Cancer Reporting in New York State

In the New York State cancer program, cancer reporting has proved to be of value in each of the ways outlined hereinbefore.

In epidemiologic research, cancer reports are providing basic information which will make it possible to measure progress in early diagnosis and reduction of mortality. From 1940 on, reporting made possible the measurement of trends in mortality on the basis of accurately diagnosed cases, as distinct from other cases. It will be possible to estimate the cure rates of different types of cancer in different age groups in different sections of the State and in different population segments.

We believe the outstanding epidemiologic problem in cancer to be the discovery of groups which are exposed to increased risk of developing cancer. For such research, detailed histories are usually Cancer reports, however, can be necessary. used as a basis for obtaining such histories in a random sample of reported cases, eliminating whatever selective factors might operate if only hospital cases were utilized. The correlation of cancer reports with other morbidity and mortality data routinely received by a health department also offers interesting possibilities for research. For example, by comparing reported cancer cases with the state-wide file of previously reported syphilis cases, there appeared an unexpected correlation between syphilis and cancer of the cervix.3 Such an observation points the way for further investigation, especially along the lines of case finding. Obviously, research in the epidemiology of cancer can be made on various types of data, of which cancer reports are only one.

From the standpoint of public education, the most useful contribution of cancer reporting has been that it enables us to base our facts and figures on living cases rather than on deaths. A second point of value is that speakers in a particular community can refer to the data for that locality. News reports based on local case incidence are more readily accepted by the press and receive greater attention from the public. Physicians lecturing before medical meetings also make use of the information on the incidence of various types of cancer in preparing their material.

A valuable further use of the cancer roster is in helping tumor clinics to maintain a follow-up system. Complete follow-up of cancer patients is essential for the evaluation of therapy, as well as for proper health supervision of patients. Most clinics experience great difficulty in tracing all their patients. The cancer roster, through its

<sup>\*</sup> It is a pleasure to acknowledge here the work of Miss Frances King, formerly supervisor of Local Health Records, New York State Department of Health, whose early interest in the office organization of the cancer rosters contributed greatly to their efficient functioning.

ously, and formerly it was felt that in the hypertensive individual there was an increase in the peripheral resistance because of an increased tone of the splanchnic arterioles. If vasoconstriction were limited to the splanchnic vessels, it would be expected that the resulting hypertension should increase the flow of blood in other organs, particularly the skin. Yet it is known that the blood flow in the extremities remains normal. It appears that in a patient with essential hypertension there is a widespread increase in arterial tension throughout the entire vascular system. In view of the fact that the capacity of the vascular bed is greater than the total volume of the circulatory blood, active vasoconstriction must be in force over the arterial system to insure the vital organs an adequate blood flow (White and Smithwick).8

Because spasm of the splanchnic vessels was considered to be an exciting factor in essential hypertension, the surgical attack upon the sympathetic nervous system was undertaken to increase the flow of blood to the splanchnic bed by resection of the sympathetic ganglia for hypertension. Craige in 1934 and Craig and Adson<sup>10</sup> in 1939 advocated the removal of the first and second lumbar ganglia with division of the greater splanchnic nerve and a portion of the celiac ganglion. This operation was a two-stage procedure below the diaphragm and is referred to as a subdiaphragmatic sympathectomy. Peet<sup>11</sup> in 1935 advocated the removal of the lower three dorsal ganglia and trunk with a segment of the greater splanchnic nerve on each side by removing a portion of the eleventh rib. This procedure was carried out as a one-stage operation. Crile12 in 1937 removed the celiac ganglion with the greater and lesser splanchnic nerves as a twostage procedure. Smithwick13 in 1940 advocated the supra- and infradiaphragmatic sympathectomy, which in reality is a combination of the Adson and Peet operations. After the supradiaphragmatic operation, the blood-pressure did not remain down and Smithwick added a subdiaphragmatic procedure, with improvement in the patient's condition.

The splanchnic bed cannot be completely denervated of its sympathetic fibers by either the supra- or subdiaphragmatic procedure and therefore one should not expect to get the maximum result from operative procedure unless the splanchnic bed is completely denervated, as has been emphasized by White and Smithwick. Sympathetic fibers go from the lower sixth thoracic and the first and second lumbar ganglia and, of course, through the greater, lesser, and least splanchnic nerves. The celiac ganglion sympathectomy seems to be contraindicated, as it results in a postganglion denervation which

makes the vessels sensitive to adrenalin, according to the work of White, Okelberry, and White-law.<sup>15</sup>

In Doctors' Hospital and New York Post-Graduate Hospital between February, 1942, and October, 1943, thoracolumbar sympathectomy, which includes removal of the ninth, tenth, eleventh, and twelfth thoracic and first and second lumbar ganglia and chain, with 6 inches of the greater splanchnic nerve and the lesser and least splanchnic to the celiac ganglion, has been performed on 40 patients. Dr. Carnes Weeks had operated upon over 40 cases of essential hypertension before entering the service in February, 1942, and asked me to continue the work. Therefore I had the opportunity to assist him with ten operations before undertaking any personally. This series of cases is obviously not large, but one can draw some conclusions as to selection of patients, anesthetic problems, and the technical difficulties encountered by the novice in this field of surgery.

The great difficulty is the selection of patients for operation. Even in advanced cases, the operation may provide some relief, particularly from disabling headaches, and may add months, if not years, of life. The four groups into which hypertensive cases have been divided merely provide a means of expressing the degree of associated pathologic changes, and obviously if the majority of cases fall into Groups 1 and 2, the mortality will be essentially zero, and the end results most gratifying. Unfortunately, cases which belong in Groups 3 and 4 are frequently seen and naturally they are not the ideal type for the best end results, but they may be entitled to the benefits of surgery after careful clinical study.

It was with definite mental reservations as to end results that I undertook sympathetic surgery for essential hypertension and for that reason I was more than willing to operate upon the advanced cases if the internist and the patient requested surgery. If relief could be afforded individuals with papilledema, renal insufficiency, impending uremia, and marked cardiac damage. then obviously the more favorable cases would give excellent results. Patients in Group 1 or 2 may go for some years before developing papilledema, renal insufficiency, and marked cardiac damage, and the internist has a logical argument as to whether surgery has done all one claims for it in the uncomplicated cases and whether medical management could not have accomplished just as much in these early cases. It is obvious that improvement in these advanced cases after operation must be attributed to the interruption of the vascoconstrictor fibers of the sympathetic system with a pooling of the blood in the splanchnic area.

The type of anesthesia to be employed in

## THORACOLUMBAR SYMPATHECTOMY IN ESSENTIAL HYPERTENSION

#### J. WILLIAM HINTON, M.D., New York City

A DIAGNOSIS of essential hypertension indicates an abnormally high systolic and diastolic arterial pressure, in the absence of inflammatory kidney disease, urinary tract obstruction, or other disorders which are known to cause high blood pressure.

Hypertension is frequently encountered in clinical practice. Master, Marks, and Dack¹ found that among 15,000 persons over 40 years of age 41 per cent of the men and 51 per cent of the women had a blood pressure reading of 150/90 or higher. The New York City Department of Health in 1941 reported an incidence of hypertension in one-third of the population 40 years of age or older.² The disease is therefore of vital interest to every physician.

In 1939 Schroeder and Steele<sup>3</sup> reported that of 218 cases of essential hypertension studied at the Rockefeller Institute over a period of ten years, 90 of the patients were dead, 11 were not followed, and 117 were living. These 117 cases were studied within two years from the onset of the disease. A classification of hypertension cases

is most difficult, but Schroeder and Steele gave four organic classifications which include:

Renal disease:

(a) Glomerulonephritis

(b) Urinary obstruction

(c) Polycystic kidneys

(d) Pyelonephritis

- (e) Aberrant arterial supply to the kidney
- (f) Wilms' tumor
- 2. Diseases of the nervous system:

(a) Tumors of the brain

- (b) Diseases of the nervous system, such as bulbar poliomyelitis
- 3. Diseases of the endocrine system:
  - (a) Basophilic tumors of the pituitary
  - (b) Tumors of the adrenal gland
  - (c) Tumors of the ovary—namely, arrhenoblastoma
- 4. Diseases of the arterial system:

Generalized arteriosclerosis

5. Unclassified, which probably fell chiefly into Groups 2 and 3.

A most careful clinical investigation must be carried out before patients can be grouped into the so-called "essential" hypertension category. Schroeder and Steele suggested that essential

before the joint meeting of the Onondaga County Real Society and the Syracuse Academy of Medicine, Medical 9, 1943.

hypertension is not a primary disease, and the fact that the diagnosis is made by exclusion should indicate multiple causes.

Hypertension cases have been divided into four groups, depending upon the severity of the eye-ground changes, for purposes of clinical correlation of end results:

Group 1. Arteriolar construction only, with normal renal function.

Group 2. Tortuosity and nicking veins at crossings, with normal renal function.

Group 3. Marked arteriolar changes, associated with retinitis with hemorrhage or exudate, or both, with impaired renal function.

Group 4. Malignant hypertension because of the papilledema with hemorrhage and exudate, and marked impaired renal function.

#### Technic of Operation

The surgical approach to hypertension has been through the sympathetic nervous system. Gaskell and Langley divide the autonomic system into the sympathetic or thoracolumbar division, including the thoraco- and first and second lumbar segments, and the parasympathetic or the craniosacral division. It is the sympathetic or thoracolumbar division that interests us in this presentation, and more specifically the portion of the thoracolumbar which supplies the splanchnic area. The sympathetic fibers come from the seventh, eighth, ninth, tenth, eleventh, twelfth thoracic and first and second lumbar ganglia, in conjunction with the greater, lesser, and least splanchnic nerves, which supply the splanchnic bed.

The body is constantly protected by the sympathico-adrenal system, as this mechanism prevents loss of heat during exposure to cold by vasoconstriction of the peripheral vessels. It is likewise a means of preventing shock from trauma due either to accident or to operation. Therefore the surgeon is constantly aware of the protection afforded by the sympathico-adrenal system, whenever excess stress or strain is placed upon the individual, as has been emphasized by Cannon. He states that if emotion cannot be controlled, it should be worked off by physical exercise. Fulton states that the mental energy expended in an armchair can produce as much stress and strain as that produced from the crew

constriction of the splanchnic vessels can clevate the systemic blood pressure conspicu-

EKG: Reveals considerable myocardial damage, probably left axis deviation, digitalis effect.

X-Ray of Kidneys: Both kidneys small; both concentrate intravenous dye to a fair degree.

Course.—Because of persistent vomiting, digitalis finally was discontinued. Belladonna was no longer given. The patient received intramuscularly vitamin B complex, 3 cc. four times a day, and phenobarbital, 1 grain three times a day, by mouth. During the next five days the blood pressure fell to 203/130 and the pulse rate fell to 100. However, the urea nitrogen rose to 54 mg. per cent.

Autopsy.-Autopsy revealed marked cerebral arteriosclerosis, generalized arteriosclerosis, cardiac hypertrophy and dilatation, bilateral advanced pulmonary tuberculosis (cavity in left lung containing 500 cc. of fluid), chronic glomerulonephritis, and terminal bronchopneumonia.

This case gives evidence of reversibility of kidney function following a thoracolumbar sympathectomy. Previous to the first-stage operation the urea nitrogen was 54 mg. per cent and the urine contained 400 mg. per cent of albumin. Twelve days following the first-stage operation the urea nitrogen dropped to 38 mg. per cent and the urine showed 85 mg. per cent of albumin. Seven days after the second-stage operation the wea nitrogen dropped to 27 mg. per cent and the urine contained 65 mg. per cent of albumin. The patient survived the second-stage operation for two weeks and was ready to get out of bed when he suddenly became evanotic and dyspneic and died seventeen days later.

The question may arise, why was a patient in such an advanced stage of hypertension operated upon? The answer is that surgical intervention was urgently requested by one of the outstanding internists of New York, who had been an intimate friend of the patient for twenty-five years, and also by the patient and his wife. The patient's ambition was to live one more year in order to complete a particular assignment in Washington which he believed he could accomplish in that period of time if his life could be prolonged. It was felt by all concerned that his only chance lay in the performance of a thoracolumbar sympathectomy.

It is still too early to draw definite conclusions regarding the remaining 37 cases.

Cases 2 and 3.—Two of the patients are dead. One of them, a young man 27 years of age with papilledema and complete loss of vision, had a return of normal vision and returned to work ten weeks after leaving the hospital. He worked regularly for six months, but died from uremia ten months following operation. In this case operation was performed at the insistence of the patient's wife, as he had been refused surgery in one of the large clinics. The other patient was a young man, 21 years of age, who went blind in the interval between the two operations, regained his vision and lived for six months, but died from uremia after having returned to work for a period of three and a half months following opera-

Several of the remaining 35 cases were far advanced.

Cases 4 and 5.—One patient, a young man 21 years of age, referred by Dr. Mosenthal, had papilledema, 8 mg. per cent of albumin in the urine. blood pressure of 265/165, and was totally disabled.

He had had symptoms of hypertension for five years and had been treated at the Rockefeller Institute for hypertension with a blood pressure of 180/130 for two years before being operated upon. At the time of writing, one year after operation, he has been working regularly in a defense plant for the entire year of 1943. In the early part of September, 1943, he was married. His blood chemistry findings are normal. The urine shows a faint trace of albumin The blood pressure on September 15, 1943, was 150/106. This case also would seem to indicate that there is a reversibility in kidney function follow. ing thoracolumbar sympathectomy.

Another patient had been totally disabled for four and a half years and was retired on a small pension from a bank where he had been formerly employed. His blood pressure at the time of operation in June, 1942, was 200/120. Papilledema and blurring of vision were present. He had been seen at the Rockefeller Institute in January, 1942, by Dr. Harry Schroeder, who had advised against a sympathectomy, in view of the advanced condition of the patient's disease. At that time Dr. Schroeder was referring more patients for sympathectomies than any other physician in New York and was enthusiastic over the results. This case merely proves the difficulty of selecting patients for opera-This patient has been working for the past twelve months as a freight handler for the Pennsylvania Railroad, and his blood pressure, taken Ocber 12, 1943 by Dr. Blake Donaldson, was 130/90. His headaches, which were excruciating in character previous to operation, have entirely disappeared. A stellate ganglionectomy performed three years before the sympathectomy had failed to give any relief.

I have a number of patients in the more favorable groups who show excellent results, but it would be premature at this time to draw conclusions as to what percentage may be cured during this period of time in which I have been performing this operation. One definite impression is that in spite of all the various methods of studying these cases, including the sodium amytal test, cold pressor test, and refusing operation to patients over 50 years of age, it is difficult if not impossible, in the advanced cases, or in those falling in Groups 3 and 4, to forecast the end results of a thoracolumbar sympathectomy.

operating on patients with essential hypertension is most important. In Dr. Weeks' cases and in mine, we were fortunate in having Drs. Phelps and Burdick of Doctors' Hospital administer the anesthetic in the majority of instances. These authors recently presented a paper on this subject.16 In our experience we have found that endotracheal anesthesia is essential. cyclopropane or either is used will depend upon the physical findings in the individual case. It is essential that the blood pressure be maintained at 100 mm. of mercury or thereabouts. The blood pressure will drop to zero very suddenly when the operator grasps the greater splanchnic nerve. particularly in the second-stage operation. The anesthetist should be ready to administer neosynephrin as soon as the pressure drops to 100 mm. of mercury or below. A small amount of saline should be kept running intravenously; a 250 cc. bottle is adequate in order not to impose an excessive fluid load on the damaged circulatory system. One minim of 0.25 per cent neosynephrin is inserted directly into the tube, and is thus absorbed into the circulatory system instantaneously. The neosynephrin administration is repeated as often as is necessary to keep the blood pressure elevated at 100 mm. of mercury. The parenteral administration of fluids postoperatively should be guarded against, as overloading of the circulatory system may occur. If any supportive measure is needed it is better to give concentrated plasma, not over 250 cc.

One of the technical difficulties encountered in the operative procedure is the danger of opening the pleural cavity. If this occurs and positive pressure anesthesia by endotracheal administration is being employed, the lung is kept expanded during operation. After the operation has been completed air can be aspirated from the pleural cavity and the extrapleural space by catheter and suction. The opening in the pleura may be too small to be noticeable, but the patient will have a pneumothorax which may prove fatal. If there is any question of the lung's not being expanded after the operation has been completed it is better to insert a needle in the chest cavity and aspirate any air that may be present. In this way the circulatory system is relieved.

#### Results

Of the 40 patients upon whom I have operated, one case fell in Group 1, 4 in Group 2, 15 in Group 3, and 20 in Group 4. Ten of the 40 patients had been refused operation in well-known clinics. Among the 20 cases in Group 4 there were three hospital deaths, two from myocardial insufficiency, one of which occurred on the thirteenth day and the other on the third day following the first-stage operation. The third death was due to

the filling of a tuberculous cavity which had been present for twenty years.

Case 1.—This patient was a white man, 40 years of age, who had had pulmonary tuberculosis since The onset occurred two years after an attack of influenza. During the course of the tuberculosis there were several episodes of cough, fever, and marked hemoptysis. In 1924 a left posterior thoracoplasty was performed, followed in 1934 by a left axillary thoracoplasty. In spite of these two procedures, the cavity in the base of the left lung did not collapse and the sputum was persistently positive. In December, 1941, the patient became conscious of dyspnea on effort, which was mildly progressive. Since February, 1942, he had suffered from occipital headache, blurring of vision, occasional tinnitis, and nosebleed. In March, 1942, he noted occasional ankle edema, oliguria, and orthopnea. During that month, while he was in Boston, he had several attacks of paroxysmal dyspnea, apparently progressing to severe circulatory failure, evidenced by orthopnea, dyspnea, ankle edema, oliguria, and vomiting. He was given digitalis and belladonna and put on a low salt and liquid diet. He apparently recovered from cardiac failure, since at the time of admission to the hospital the only symptoms were mild dyspnea and vomiting.

Physical Examination.—Physical examination revealed a mildly dyspneic, malnourished individual, with no icterus, edema, or ascites. The fundi showed bilateral papilledema, considerable auriculoventricular nicking, a/v = 1/3, and numerous old and Mild tinnitis was present. fresh hemorrhages. The neck veins were moderately dilated but did not fill from below. There were no arterial pulsations. The left side of the chest showed evidence of a previous thoracoplasty in the axillary and posterior basal areas. The chest did not expand to a normal degree. Some dullness and amphoric and bronchial vesicular breath sounds with medium and coarse moist rales were noted over the left posterior and axillary lower half of the lung. A pleural rub was heard consistently over the precordial area. The right lung was clear to percussion and auscultation.

Heart: RMD, 6 cm.; ML, 10 cm.; MR, 4.5 cm. The sounds at the apex and base were loud and of good quality. The aortic second sound was snapping and considerably greater than the pulmonic second sound. There were no thrills or murmurs. RSP, VP = PR = 130; blood pressure 260/160.

Abdomen: No viscera palpable, no ascites, no peripheral edema or arterial sclerosis.

Laboratory Data.—Blood: Red blood cells 4.03, hemoglobin 83 per cent, white blood cells 8,800, polymorphonuclears 77 per cent, lymphocytes 18 per cent, monocytes 4 per cent, and urea nitrogen 30.6 mg. per cent.

Urine: Specific gravity 1.012, albumin 3 plus, fine granular casts, occasional red blood cells, fish-berg-concentrates to 1.020, PSP—25 per cent excreted in two hours; and the specimen did not reveal presence of acid-fast organisms in fresh sediment or in concentrates.

Sputum: Positive for tuberculosis.

### Diagnosis

#### CLINICOPATHOLOGIC CONFERENCES

FOURTH MEDICAL DIVISION OF BELLEVUE HOSPITAL

Date: March 2, 1944

Conducted by: Dr. Emanuel Appelbaum

Dr. Mary B. Finck: R. A., a 39-year-old Jewish housewife, was admitted to Bellevue Hospital on November 27, 1943. Her illness began in January, 1943, eleven months before admission. At that time the patient caught a "head cold" which persisted for three months. A diagnosis of nasal polyps and sinusitis was made at the outpatient department of another hospital and drainage of the left antrum was done, with little benefit. Skin tests for allergy revealed sensitivity to weeds and asparagus. The patient gradually improved and in June went to her accustomed place in the country. One week after arrival she had her first attack of bronchial asthma. This was relieved by adrenalin and the patient remained well until she returned to the city in September, when she again developed bronchial asthma and was treated at an institution near her home. On discharge from that hospital, four weeks before admission to Bellevue Hospital, the patient noticed weakness, dyspnea, marked difficulty in walking because of sharp, stabbing pains in the legs, loss of appetite, rapid weight loss, and numbness, tingling, and weakness of the hands. Sulfathiazole, prescribed by a private physician, produced nausea and epigastric burning, and was discontinued after two days.

The past history was negative except for several mild attacks of "rose fever" on first going to the country in the summer. The family history revealed that the patient's mother had died of asthma at the age of 51, and both of the patient's sons have "rose fever" in the spring.

Physical examination on admission revealed a moderately well-nourished and well-developed white woman. She did not appear ill but was extremely apprehensive and emotionally unstable. The temperature was 100.2 F.; the pulse, 90; respirations, 28; and the blood pressure, 142/88. The head and neck appeared normal except for a small nodule in the right lobe of the thyroid. The lungs showed a few scattered rales in the right lower chest. The heart was rapid in rate but it was otherwise normal. Examination of the abdomen disclosed only a barely palpable, slightly tender liver edge.

The deep reflexes were hyperactive but there were no abnormal neurologic signs.

Laboratory Data.—On admission, the red blood count was 4,200,000, with 14.5 Gm. of hemoglobin. The white blood count was 46,600, with 38 per cent polymorphonuclears, 4 per cent stab forms, 18 per cent lymphocytes, and 48 per cent eosinophils. Urinalysis showed a specific gravity of 1.024, 2 plus albumin, and a few hyaline casts and white blood cells. The phenolsulfonphthalein kidney function test showed 11 per cent excretion in two hours. The blood Wassermann reaction was negative. Blood agglutinations for typhoid, paratyphoid, Brucella, and Weil-Felix were negative. The blood nonprotein nitrogen was 34 mg. per cent; the calcium, 8.4 mg. per cent; and the phosphorus. 3.85 mg. per cent. The albumin-globulin ratio was 3.6/3.2 Gm. per cent. Liver function tests showed normal results. Erythrocyte sedimentation rate was 25 mm. per hour. The cerebrospinal fluid showed no abnormality. Trichinosis precipitation test and complement fixation test for same were both negative. A muscle biopsy was done on December 15, 1943. An electrocardiogram on admission showed a sinus tachycardia and a seagull T wave in lead I. Later electrocardiograms showed a gradual improvement in the T wave. X-rays of the sinuses showed diffuse clouding of all the accessory sinuses. Chest plates on December 22 and December 27 showed diffuse bronchopneumonic infiltrations of both lungs, more marked in the left mid-lung field. Chest x-ray on January 20. 1944, revealed clear lung fields and a normal heart and aorta.

Course.—The patient ran a low grade fever with relative tachycardia. The blood pressure remained around 130/80. Muscle pains required almost constant analgesia and sedation and there were frequent attacks of abdominal cramps and diarrhea. On December 20 the patient coughed up a moderate amount of old and fresh blood and the chest showed duliness and moist rales over the left lower lung field. The liver was felt three fingerbreadths below the costal margin and the tip of the spleen was palpable. Sulfadiazine was started and continued to 13 Gm. On December 24 the patient began to complain of dyspnea and rapidly went

#### Comment

It must be remembered in discussing surgery of the sympathetic nervous system for essential hypertension that several types of operation have been performed; we cannot group the end results from these different types of operations into one category. Operations which come closest to a complete denervation of the splanchnic bed should give the best end results

Patients suffering from essential hypertension are entitled to the benefit of a consultation, but the consultation should be held with an open mind. Those of us doing surgery are seeing patients who have been refused the opportunity of having the facts, as they now exist, as to the possible benefit of sympathetic surgery, honestly and clearly presented to them so that they, as intelligent individuals, may make a choice as to the course to be followed; namely, further medical management and later surgical intervention, or early surgical intervention before advanced cardiorenal changes have become manifest. This decision rests with the patient.

The following case will illustrate the difficulty of presenting a clear picture of the problem to the patient.

Case 6.—A woman 44 years of age, married, with no children, was known to have a normal blood pressure in October, 1941. Six weeks later she consulted another physician, for a condition unrelated to the cardiovascular system, who found a blood pressure of 225/120. She was under this physician's care for several months. She then consulted a gynecologist for another complaint, at which time (six months after the onset of the hypertension) he advised her to seek an opinion as to the possibility of a thoracolumbar sympathectomy. Six weeks later I saw this patient, whom I had known twenty years previously. After a complete work-up she was found to have essential hypertension, Group 2, with some cardiac enlargement and a blood pressure of 200/130. The facts were frankly presented to the patient, her husband, and the referring gynecologist, and the patient decided to have the operation. By chance she met a well-known cardiologist a few days before she entered the hospital, and he strongly advised against such a procedure Since his advice was not solicited by the patient, she asked him how many patients he had ever seen operated upon for essential hypertension and what types of operation they had had, to which he could reply only he had seen none. The patient's comment was that perhaps her judgment might be as good as his as to what course she should pursue. Nine months following operation she was examined by Dr. Charles Poindexter, one of New York's well-known cardiologists, who made the following statement.

"Physical examination revealed that the blood

pressure was 132/90. The heart tones were entirely normal, and there is a very minimal evidence of peripheral vascular change.

"On fluoroscopy a very slight amount of enlargement of the left ventricle is seen. Otherwise the

heart seems to be perfectly normal.

"The electrocardiogram is well within normal limits and does not even have a left axis deviation

"I really think this is a most remarkable case that I have seen. The results seem to me just about Of course I no not know what her cardiac findings were before the operation, but certainly at the present time her condition is excellent. It will be very interesting to see what the years to come will bring forth. It is the first time I have developed any enthusiasm for the operation "

#### Conclusion

Patients with essential hypertension should have the facts honestly presented so that they may make their own decision as to whether or not to have the operation.

Thoracolumbar sympathectomy has produced reversible changes in kidney function as demonstrated by blood chemistry findings.

Papilledema resulting in blindness has been

relieved, with return of normal vision.

4. Patients totally disabled over long periods of time, one for four and a half years, have been restored to a normal earning capacity.

5. Cases in Group 4 should not be considered hopeless, as excellent results are frequently obtained by thoracolumbar sympathectomy.

130 East 79th Street New York City

Children have more need of models than of critics.—Joubert

the muscles, but no evidence of periarteritis nodosa. This author suggested a possible relationship between trichinosis and periarteritis

The terminal episode is difficult to interpret. The possibilities for consideration are occlusion of the mesenteric vessels, intestinal perforation, and intra-abdominal or retroperitoneal hemorrhage. The intestinal distension appeared to be caused by a paralytic ileus. One must also consider the possibility of uremia, although the blood nonprotein nitrogen on January 23 was reported as normal. Unfortunately, no determination was made during the terminal period. Many of the cases terminate in uremia, of which paralytic ileus may be a feature.

In summary, this patient presented a diverse symptomatology, strongly suggestive of periarteritis nodosa. A muscle biopsy seemed to support this diagnosis. However, the possibility of trichinosis was not definitely ruled out. The weight of evidence favored the diagnosis of periarteritis nodosa.

Dr. CATHERINE R. KELLEY: The outstanding feature of this case on admission, before the blood count was obtained, was an apparent anxiety neurosis. The patient's first episode of asthma followed a severe emotional upset. There were no outstanding physical signs aside from the emotional state.

Dr. Arnold Koffler: It is unique that we have been able, on our Division, to diagnose such a relatively large number of cases of periarteritis nodosa antemortem. I heartily agree with Dr. Appelbaum that the reason is the fact that we have always borne in mind the progressive clinical picture and the widespread involvement of so many different organs and systems.

An unusually similar case of allergy and periarteritis nodosa was reported in a recent issue of the Mayo Clinic Bulletin. Marked eosinophilia was as prominent a finding here as in the case discussed today. But I believe we have overstressed this finding in the discussion today. In fact, I believe that I am right in saying that this finding was entirely lacking in most of the cases discussed at these conferences.

DR. EMANUEL APPELBAUM: It is not to be expected that the diagnosis can be made on first observation. In most instances one must study the evolution of the disease in order to establish

its presence.

Dr. Ofto Steinbrocker: I saw this patient when she came in and saw her later during her hospital course. Strangely enough, her symptoms improved to such an extent before death that the prognosis appeared good. However, the fact that the erythrocyte sedimentation rate was more elevated at that time than it had been

on admission might have suggested that her condition was not as good as it appeared to be clinically. My original diagnosis was trichinosis and I still think that it is a good additional possibility.

DR. HENRY C. FLEMING: What is your opinion regarding the pathogenesis of hypertension in periarteritis nodosa?

DR. EMANUEL APPELBAUM: Most cases of periarteritis nodosa at autopsy show extensive involvement of the renal arterioles, which may account for the hypertension, but sometimes the hypertension appears before there is any clinical or laboratory evidence of renal disease. In these, it is assumed to be the result of diffuse vascular lesions.

DR. ARTHUR L. WASHBURN: Three questions come to my mind: Have you ever seen intestinal obstruction in trichinosis? Do the electrocardiographic changes in trichinosis resemble those of coronary occlusion? Does the eosinophilia rise as high as 66 per cent in either trichiniasis or periarteritis nodosa?

Dr. Emanuel Appelbaum: We have never seen intestinal obstruction in trichinosis. The eosinophilia may vary from 0-90 per cent in trichinosis. It also may be very high in periarteritis nodosa associated with asthma or other allergic manifestations. Seventy per cent is the highest I have observed in periarteritis nodosa. With regards to the other question, any type of electrocardiogram indicative of myocardial damage may be observed in trichinosis.

Dr. Harold J. Livingston: In the two cases reported in the J.A.M.A. by Reimann et al., there were many diagnostic factors in favor of periarteritis nodosa. In the first case the muscle biopsy showed histologic changes of periarteritis nodosa but the specific tests gave a positive precipitin test with trichinella antigen. while the intracutaneous and complement fixation tests were negative. In the other case, the features were very similar and the specific tests gave varied results and only on postmortem were the encysted trichinella larvae found. It. was suggested that the lesions may be on an allergic basis incited by trichina. Rich experimentally produced typical lesions of periarteritis nodosa in the rabbit on an allergic basis.

DR. MAXWELL L. GELFAND: Is hypertension commonly found in trichinosis?

DB. APPELBAUM: No.

Dr. Max Trubek: A high eosinophil count is usually a good prognostic sign in trichinosis. This case, in both the constitutional and family history, demonstrated well the relationship of toxic allergic conditions to vascular disease. I think we will find the lesions distributed throughout all the organs, including the mesenteric

into left ventricular failure and semicoma. Intravenous' digitalization and other emergency measures were effective and the patient was kept on a maintenance dose of digitalis thereafter. By January 12 the cardiac failure and lung signs had cleared completely.

The blood counts showed an increasing anemia and a persistent leukocytosis of 27,000 to 46,000, with eosinophilia varying between 66 and 15 per cent. The urine concentration remained good; the albumin varied between 1 and 4 plus and sediment showed white blood cells, hyaline and granular casts, and occasional red blood cells. The blood nonprotein nitrogen remained normal. The erythrocyte sedimentation rate on January 21 was 55 mm. per hour.

The patient appeared to improve somewhat. in spite of persistent paresthesias and muscle weakness, until January 23, when she began to complain of nausea, vomiting, and epigastric and periumbilical pain radiating to the back. She showed only slight abdominal tenderness. blood amylase taken at this time was 8.9 units. On January 28 the pain became most intense in the right lower quadrant, with tenderness, slight rigidity, abdominal distension, and absence of peristaltic sounds. A Miller-Abbot tube was passed and Wangenstein suction was applied. Colonic irrigation and prostigmine were used, with some relief of the distension, but the temperature gradually rose to 103 F., the patient became rapidly cachectic and irrational, and died on January 31, 1944, the sixty-sixth hospital day.

#### Discussion

Dr. Emanuel Appelbaum: This patient presented an extremely varied symptomatology, which included a history of asthma, pains in the legs, tingling, numbness, and weakness of the hands, progressive anemia and cachexia, abdominal cramps and diarrhea, a prolonged low grade fever, evidence of renal damage, hemoptysis, leukocytosis, eosinophilia, and signs of cardiac failure. The terminal phase of her illness was characterized by serious abdominal manifestations.

It is, of course, well known that periarteritis nodosa is a disease of diverse symptomatology, as would be expected, since the arterial system of any organ or set of organs may be involved. This makes the antemortem diagnosis very difficult: In 1921 Meyer mentioned the combination of chlorotic marasmus, polyneuritis and polymyositis, and gastrointestinal symptoms as being a diagnostic triad. To these manifestations Brinkmann added nephritis. Several years ago I suggested the formulation of a more comprehensive diagnostic pattern by adding to the

Meyer-Brinkmann tetrad a few other common features of this remarkable disease. These included evidence of diffuse vascular involvement, signs of infection such as fever, leukocytosis, and increased sedimentation rate, eosinophilia, and the presence of erythematous, hemorrhagic, or nodular skin lesions. On the basis of this formula we have been able to make a correct intra vitam diagnosis of periarteritis nodosa in several cases. It is also extremely important to perform a skin or muscle biopsy whenever the existence of periarteritis is suspected, although a negative result of this procedure does not rule out the possible presence of this disease. Since many of the features included in the diagnostic pattern were present in this case, a diagnosis of periarteritis nodosa seemed logical.

However, in the differential diagnosis one had to consider the possibility of trichinosis, the sub-acute or chronic form of which may simulate periarteritis nodosa very closely. Prolonged fever, pain in the extremities, pseudoparalysis, leukocytosis, eosinophilia, asthma, and albuminuria may occur in the course of trichinosis. The negative precipitin and complement fixation tests weakened but did not definitely rule out the diagnosis of trichinosis. Unfortunately, the intradermal test was not done. Only one of these three specific tests may be positive and the other two negative. There are also instances of trichinosis in which all of these three laboratory procedures are negative.

In regard to the episode of acute myocardial failure it may be noted that this complication is fairly common in periarteritis nodosa, especially as a terminal event. On the other hand, myocardial damage with circulatory failure is occasionally encountered in trichinosis. I have observed several such instances.

Now, what about the biopsy? Let me read to you the microscopic description of a muscle section: "In the muscle, the fibrous tissue between the muscle bundles is infiltrated with lymphocytes, plasma cells, and eosinophils. The lumina of some of the blood vessels are narrowed because of intimal proliferation. The adventitia or perivascular fibrous tissue is infiltrated with lymphocytes, plasma cells, neutrophils, and eosinophils. Extravasated red blood cells appear between some of the muscle bundles."

These lesions are typical enough for periarteritis nodosa. But similar foci of cellular infiltration are frequently seen in trichinosis. The perivascular and arterial involvement may also be found in trichinosis. Reimann recently reported a case of this kind. The muscle biopsy in Reimann's case was reported as typical for periarteritis nodosa. The necropsy, however, showed the presence of encysted trichinellae in

tures alluded to above. The heart, liver, pancreas, kidneys, and small intestine were the organs most seriously involved. (Fig. 1)

Heart .- Scattered throughout several sections of myocardium examined microscopically were numerous large, irregular areas of fibrosis. Within and about these scars were arteries showing both healed and active lesions. The latter were characterized by degenerative changes in the media, evidenced by the presence of edema, fibrinous exudate, and swelling of the muscle cells. In some vessels a part or the entire circumference had undergone coagulation necrosis, imparting a hyaline-like appearance to the media. Where this change was marked, the intima was raised and pushed into the lumen, giving the latter an eccentric position and reducing it to a narrow slit. In others there was infiltration of the media and adventitia with polymorphonuclear leukocytes, eosinophils, lymphocytes, and plasma cells. The perivascular connective tissue was edematous and infiltrated with large numbers of leukocytes. In a few there was destruction of the entire wall. In others, there was marked proliferation of fibroblasts from the adventitia into the inflammatory zone, accompanied by a reduction in the polymorphonuclear leukocytes and an increase in the lymphocytes and plasma cells. The healed lesions were few in number. These were characterized chiefly by a marked subendothelial connective tissue proliferation with marked narrowing of the lumina. There were no aneurysms nor thrombi noted.

Kidneys.—Microscopic examination of the kidneys revealed the same changes in the vessels alluded to above. Besides these, there were changes noted within many of the glomeruli. In these, the epithelial cells lining both the visceral and parietal layers of Bowman's membrane were

swollen and in a few instances proliferating. The capsular spaces and proximal convoluted tubules contained red blood cells and polymorphonuclear leukocytes. In many instances the capillary tufts were simplified, and within the lumina of a few hyaline thrombi were found. Several small scars were noted. The tubules in these latter areas were atrophic.

Intestine.—Within the muscular coat were numerous blood vessels showing active lesions. The lumina of a few were plugged by thrombi. In many instances, the overlying mucosa was ulcerated, the resulting gap being bridged by fibrin or filled in with necrotic debris. At times the necrosis involved the entire thickness of the intestinal wall. The perivascular connective tissue in a few instances was infiltrated with extravasated blood.

Orary.—The vascular lesions in the ovary differed in that one of the arterioles contained an organizing thrombus.

#### Anatomic Diagnosis

Active and healed periarteritis nodosa of the smaller mesenteric arteries with multiple infarcts of the small intestine and acute focal fibrinous peritonitis.

Active and healed periarteritis nodosa of coronary arteries with myocardial fibrosis.

Active and healed periarteritis nodosa involving the vessels of the liver, spleen, pancreas, adrenals, kidneys, ovaries, fallopian tubes, and uterus.

Acute glomerulonephritis.

Dr. EMANUEL APPLEBAUM: This case of periarteritis nodosa is of particular interest and value because it demonstrates the disease in the various pathologic stages and shows also that these lesions may heal.

#### COLD VACCINE SALES SCORED

The prescription and sale of cold vaccines is an unwarranted commercial assault on the public pocketbook, the *Journal of the American Medical Association* for January 22 declares. The *Journal Save*.

eays:

"Recent communications to the offices of the American Medical Association indicate that the prescription and sale of cold vaccines is again taking place on a large scale. This, in the face of the recognized lack of scientific evidence for the value of these preparations, is indication of irresponsibility on the part of some manufacturers of pharmaceuticals. The scientific evidence against the value of oral cold vaccines is overwhelming; consequently individual physicians and firms who deal in pharmaceuticals and who lend themselves to wholesale uncontrolled distribution of such preparations are perpetrating an unwarranted commercial assault on the public pocketloock."

#### CHINA TO HAVE VIRUS LABORATORY

United China Relief, through the American Bureau for Medical Aid to China, is helping to finance a rickettsia and virus laboratory which shortly will be started in China by the Chinese National Health Administration.

Dr. Chen-Hsiang Huang, who came to this country in 1941 as a fellow of the Rockefeller Institute for Medical Research, is en route to China, under the auspices of the A.B.M.A.C., to direct this work as head of the Department of Experimental Medicine in the National Institute of Health.

At the present time there is no medical school or institution in China equipped to carry on virus research, and the rickettsia and virus laboratory will be the first of its kind in that country.

During the past year Dr Huang has been Instructor in Medicine and Virus Research at the College of Physicians and Surgeons of Columbia University.—Connecticut State M. J.

Fig. 1. Photomicrograph of vascular lesion in pancreatic vessel.

arteries, possibly with small infarctions in the liver and spleen.

#### Presentation of Pathology

DR. ROBERT POPPITI: Gross Findings.—At necropsy, the body was that of a 37-year-old emaciated white woman. There was no free fluid in the peritoneal cavity. The small intestine was markedly distended and focally discolored throughout its entire length. There was no free fluid in either pleural cavity, nor were there any adhesions.

The heart was normal in size. It weighed 240 1 Gm. Aside from a few small areas of fibrosis in the apical portion of the left ventricular wall it presented no unusual changes. The coronary arteries were entirely free of atherosclerotic changes. The right and left lungs weighed 450 and 400 Gm., respectively. Both were congested. The intimal surface of the aorta was remarkably smooth. The liver weighed 1,250 Gm. Its cut surface was deep brown and smooth. There were no infarcts present. The spleen, pancreas, and adrenals showed no noteworthy changes. Both kidneys weighed 240 Gm. Their capsules stripped easily, revealing finely granular reddish-brown surfaces. Their cortices were thinner than usual. The markings were not

distinct. The reproductive organs presented no gross changes. The esophagus and stomach were natural. The entire small intestine was distended. Scattered over its surface throughout the entire length were numerous irregular, port-wine colored patches which were covered by a thin film of fibrin. On section one found that these were represented on the mucosal surface by irregular areas of superficial ulceration which varied from 2 to 10 cm. in length and from 1 to 4 cm. in width. All were covered by a thin pseudomembrane. The lumen of the bowel contained bright red blood. The colon and rectum were natural. Examination of the diaphragm, abdominal musculature, and visceral arteries revealed no changes. Consent for examination of the brain was not given.

#### Microscopic Findings

Microscopic examination revealed that the primary and essential pathologic lesions were present in the smaller arteries. These vascular lesions were found in the lungs, heart, liver, pancreas, spleen, adrenals, kidneys, ovaries, fallopian tubes, uterus, and lymph nodes. The changes noted were consistent with making a diagnosis of periarteritis nodosa. Both active and healed lesions were found in all the struc-

faction with the hospital on the part of the radiologist.

The situation has become accentuated by the entry into the field of hospital administration of the group hospitalization plans, many of which are said to be purchasing medical care from their cooperating hospitals and are thus said to be liable to the charge of unethical practice. The hospitals, on the other hand, contend that under the present pattern of hospital administration, particularly with reference to staff organizational plans, any other arrangements than those now in effect would adversely affect the patient. Since, therefore, the primary objective of both the medical profession and of the hospital is the safeguarding of the patient's welfare, either we should be forced to sacrifice that welfare or we are forced by logical necessity to devise a procedure different from the one now in more common operation. Thus far, the dilemma stands unchallenged or, to speak more exactly, not unchallenged but unresolved. From the hospital's point of view, the problem has been intensified by the recently developed increased shortage of radiologists which has made it necessary that one radiologist, in some localities, serve not one but several institutions from each of which he derives income often to an extent, so it is said, out of all proportion either to the amount of time which the radiologist devotes to any one of the institutions, or to the remuneration derived by other physicians from their hospital practice.

#### The Case for the Physician

It cannot be denied that the functions of the hospital pathologist, the laboratory physician, the physician anesthetist, the physiotherapist, and the radiologist belong essentially to the area of medical practice. As such, these medical specialists are subject to the same ethical requirements as are the internist or the surgeon, the obstetrician or the ophthalmologist. Their work is essentially to be regarded as a professional service to the individual patient; their work should be carried out strictly in the spirit of the personal relationship between physician and patient; there should be interposed in that relationship no third party. The service should not rest upon considerations of financial return but solely, according to the very first principle of ethical practice, upon the need of the patient for medical services. If any of these physicians enter into contractual relationships with an organization or institution, they, like all other physicians, the general practitioner as well as the specialist, must safeguard the ethical character of that contract. These five groups of specialists giving general hospital care must be just as careful and conscientious in their avoidance of feesplitting as the surgeon and the surgical specialist is required to be. All of this and all that is implied in it and all that might be said in amplification is theoretically sound and basically

General Service Physicians Remote from Their Patients.—In practice, however, we find the situation considerably different from the ideally and theoretically correct situation. The pathologist and the laboratory physician and the radiologist and the physician anesthetist and the physiotherapist are often more or less remote from their patients. As a general rule perhaps, or surely in general practice, the patient not only does not see these physicians but probably has never been made actually aware of their assistance or of their essential participation in hospital service. If, on rare occasions, they should find the signature of one of these physicians on a sheet included in the patient's history, the patient would probably find himself completely ignorant of the services rendered by these physicians. There is interposed between the patient and these general service physicians a vast multiplicity of physical things such as the elaborate paraphernalia of the laboratory, the mysterious machinery of the radiographic room, the complex gas machines of the anesthetist, and the museum-like display of the physiotherapy department. A casual observer who does not understand the intricacies of modern medical practice would say that these five general practice physicians are occupied with things rather than with human beings, with machinery and laboratory contraptions rather than with a suffering patient. The concept is hard to convey even to students of medicine that the pathologist or the laboratory worker is concerned even in the least with the patient, for it seems a far cry to interpret interest in a microscopic section of tissue or a test tube full of blood or urine or of mother's milk as interest in the patient, in his or her bed suffering from any one of the thousands of derangements listed in the standard nomenclature of diseases. Similarly, it seems a far cry from the tubercular lung to the radiographic picture and from the arthritic joint to the diathermic lamp.

Responsibility Is the Important Consideration .-It is a far cry but only for the person who does not understand the meaning of medical responsibility. Medical practice is not based necessarily and always and under all circumstances on immediate and firsthand contact with the patient. What is important in determining what is and what is not medical practice is responsibility. There can be no doubt about the nature or the extent of the responsibility of the

# ADMINISTRATIVE AND PROFESSIONAL PROBLEMS OF MEDICAL PRACTICE IN THE HOSPITAL\*

Alphonse M. Schwitalla, S.J., St. Louis

Dean, St. Louis University School of Medicine, St. Louis, and President, Catholic Hospital Association of the United States and Canada

FATHER ALPHONSE M. SCHWITALLA

THE title of my comments suggests a problem to which the House of Delegates of the American Medical Association and its various committees have devoted a great deal of time and attention. Even after all such discussion, it is evident that a final word has not as yet been spoken on the subject. Such comments as I might here make, needless to say, should be taken as personal views and do not constitute an official attitude of any association or group which I might be thought to represent.

At the outset, it must be recognized that we are here dealing with a controversy. Fortunately, however, the controversy is one in which difference of opinion arises, not from any unwillingness on either side to recognize the rights of the other side, but from a lack of clearness in administrative procedure which makes it most difficult to achieve a procedure which will, first, safeguard what is best for the patient; second, safeguard the interests of the physician; and third, safeguard the interests of the hospital; for it must be understood that those who have taken part in the numerous conferences that have taken place have been actuated

by a sincere desire not of promoting their own self-interests but of achieving a procedure which will really protect the patient. There is room, therefore, for no recriminations by physicians of the hospital or by hospitals of their staff members. The situation can only mean that the proper formula which should form the basis of agreement and compromise has not as yet been found. I should be foolhardy if I promised this audience anything new in an area of hospital and medical interest in which some of the best minds in both fields have attempted to find a solution for a problem of long standing. I can do little more than review in essence, and very briefly, what other students of the problem have already said much more aptly than I can hope to say it.

#### The Problem

The problem is essentially this. In the hospital there are one or more medical practitioners who for one reason or another in the past have not practiced medicine on an individual basis but have practiced their profession as salaried appointees and, hence, as agents of the hospital. By supposition, there can be no doubt about the fact that these physicians are engaged in the practice of medicine. Since, in that practice, their status as employees and, hence, as agents of the hospital, must be recognized, the hospital is thus engaged in the practice of medicine, a situation which contravenes not only the legal prescriptions of many of our states, but, what is even more important, it contravenes and violates a fundamental ethical requirement in the practice of medicine. As all know, these physicians of whom we are here speaking are those who give certain generalized services in the hospital, such as the pathologist, the laboratory physician, the radiologist, sometimes the physictherapist and the anesthetist. Among these, the radiologists, for many reasons, have been confronted by this problem in a peculiarly acute form not only because of the particular nature of their specialty but also because financial relationships are involved which may easily lead, and have de facto often led to the commercial exploitation of the radiologist by the hospital and to allegedly justifiable dissatis-

Read at the One Hundred Second Anniversary Meeting of the State Medical Society of Wisconsin, Milwaukee, September, 1943.

rangements many of the abuses of which we complain today have arisen.

The case for the physician, that is, for the pathologist and the radiologist and the laboratory physician and the physician anesthetist and the physician and the physician anesthetist and the physiotherapist is a strong one. We cannot but accept the emphatic pronouncements of the House of Delegates of the American Medical Association with reference, for example, to radiology, "Radiology is a department of medicine and the practice of radiology is the practice of medicine." The same principle merits our complete acceptance as applied to the other specialties which we have here so frequently mentioned.

#### The Case for the Hospital

The case for the hospital, I am entirely willing to admit, is far from being equally convincing. It is my frank opinion that the hospitals are today more than eager to modify their policies and practices to conform with the principles so unmistakably declared by the American Medical Association, so consonant with the broad principles of ethical medical practice, and so sound as the basis of administrative procedure. No one who knows the broad facts in the national picture can call into question the statement that evidence is accumulating "of continued encroachment of hospitals into the practice of medicine" which they do by offering "certain medical services on a service basis as a part of hospital care." No one can question the soundness of the resolution of the House of Delegates "that hospital corporations should not be permitted to engage in the practice of medicine through the medium of employed physicians or to enter into contract with any individual group, or agency, whereby the hospital agrees to furnish any medical services." Again, personally, I cannot but subscribe with emphasis to the principle that "all fees for medical services rendered in hospitals should be collected by or on account of the physician rendering such service, and all physicians concerned in the care of a patient should give or send directly to the patient, or other responsible party, a statement showing charges for professional services rendered." The hospitals in which staff relationships are on a safe and sound basis will extend that basis to include all its medical staff members and not merely those who are engaged directly and chiefly with bedside care. Where, therefore, is the difficulty?

Violation of Fundamental Medical Ethics.—Most immediately, it seems to me, and influential in the present situation is the relative universality of what in the light of our present discussion we cannot but regard as violations of fundamental medical ethics. In reviewing the types of radi-

ologic hospital contracts, a recent issue of the Journal of the American Medical Association tells us that "37 per cent of all radiologists are employed on a salary basis" inclusive of the radiologists in government hospitals and in other full time positions; that "9 per cent lease the departments on fixed rental"; that "54 per cent share gross receipts or net receipts with the hospital," but that "of this 54 per cent . . . about half (27 per cent) are under legal relationships which make the radiologist a tenant, and about half (27 per cent) an employee of the hospitals." On the basis of these statistics, the contracts between radiologists and the hospitals are of such a character that no fewer than 64 per cent of the radiologists are agents or employees of the hospital, that is, 37 per cent who are on a salary basis and 27 per cent who are on a shared receipt basis. As long as this situation continues, the problem which confronts the hospitals is obviously that the contracts must be so revised as to make the radiologist an independent and fully responsible medical practitioner. Here is one of the great problems of the hospital.

Independent Statements.—The procedures implied in this revision of contracts is probably not as simple as it may seem. The problem must, nevertheless, be faced. It has been pointed out by hospital administrators that fundamentally important changes will ensue if the patient receives independent statements from the five specialists whose practice we are here evaluating. Patients, to be sure, today who are able to carry the responsibility for their health care are accustomed to receiving statements from consultants. They understand fully and are generally sympathetic with consultation fees. If this matter is to be put on a sound basis, the patient must expect separate statements from the laboratory physician, from the pathologist, the radiologist, the physiotherapist, and the anesthetist. Hospital administrators contend that under such circumstances the curtailment of special services will be inevitable, just at a time when medicine is able to place at the disposal of the patient a greater number of diagnostic and therapeutic laboratory procedures than at any other time in medical history; just at a time when scientific medicine has reached a development which enables the physician to use laboratory findings with the utmost effectiveness in his interpretation of the patient; just at such a time, so hospital administrators have said, we are making it more difficult for the patient to avail himself of the rich results of scientific research by interposing an increased number of financial hazards between the patient and the availability of scientific results. It must be admitted that there is much value in the argument. The

pathologist or the laboratory physician or the anesthetist or the physiotherapist or the radiolo-The lives, the welfare, the safety of patients depend upon the decisions which these men render, and the responsibility for these decisions implies competence, sincerity, a love of truth, an unselfishness just as acute in its respective area as is the responsibility of the internist and the surgeon. There can be no doubt about the validity of the principle enunciated in the resolutions of the House of Delegates and of several reference committees of the House in the American Medical Association when they assert that the practice of the pathologist, of the radiologist, and of the others whom we have so often mentioned in these remarks is essentially the practice of medicine.

The case for the doctor can be strengthened still further. If all our reasoning thus far is accepted, it would follow that the pathologist and the radiologist and the others are entitled to their respective honoraria on the same basis as are other physicians who are engaged in private practice. Here precisely other acute problems make their influence felt. If these general service physicians had from the beginning regarded themselves as consultants in the same way as the gynecologist or the otolaryngologist is a consultant when he is called in to a consultation by the internist who is attempting to make a diagnosis, many a problem in the present-day practice of medicine might have been forestalled. As a matter of fact, however, for one reason or another, all of them no doubt amply warrantable at the time, radiologists and pathologists and others engaged themselves to hospitals and, probably without fully realizing the implications of their position, placed themselves at the disposal of the hospitals on a salary basis, thus becoming agents of the hospitals and exposing the hospitals to the accusations which are today hurled at them, namely, that they are corporations which are practicing medicine. No doubt there was in all of this no intention on the part of the physician to violate fundamental ethical principles; on the other hand, it is more than likely that the development of the relationships between the pathologist and the radiologist, on the one hand, and the hospital, on the other, as they exist today, are explained more or less in the way in which I have indicated. The reasons for such a development are not far to seek.

The necessity of the elaborate equipment essential in radiology, for example, or in the laboratory, the further necessity of having all of this equipment close at hand in the hospital, the continuous and daily use of this equipment, the impracticability of ownership of all of this equip-

ment by the physician should his practice be scattered over more than one institution, these and a hundred related problems explain the present situation.

Relation of the General Service Physicians to the Hospital Staff .- More subtle still is another situation to which just a brief word must be devoted. In many an institution throughout the land, the pathologist or the radiologist, and the same should be said in a measure for the other physicians whom we are considering, do not consider themselves as intimately associated with the staff. I emphasize the fact that this is not a universal condition. It is general, enough, however, to afford an explanation of conditions as they exist in some institutions. The pathologist is often a critic of the staff, as he is bound to be with reference to the staff's medical practice. The radiologist is frequently looked upon as a mere radiologic diagnostician, scarcely, if ever, seeing the patient prior to the patient's entry into the radiologic laboratory and then not for the purpose of a general clinical study but for the specific purpose of a radiologic study. The anesthetist in some institutions rarely, if ever, knows the patient prior to the patient's admission to the operating room. Sometimes he takes no responsibility for the preanesthetic procedures, and unless he is specially interested in particular surgical problems, he is not too concerned with the general clinical condition of the patient What has been said of the pathologist can be said almost in the same terms of the laboratory physician, and the physiotherapist is apt to use his science and skill without having participated in a thorough clinical review of the patient's illness. It is fully recognized that these conditions, if and where they exist, are explicable by a multiplicity of reasons, all of them valid The point I am making here is not a criticism of the situation but rather an explanation of the somewhat aloof position which the physicians whom we are here discussing are likely to occupy in the hospital

Financial Arrangements.—Finally, in discussing the case for the physician, we may glance at the financial arrangements. The radiologist has sometimes found it most convenient to accept a salary rather than to send his own statement to the patients whom he examines or treats. The same might be said of the other medical officers about whom this question arises. Here again it would seem that feasibility, facility in collection, a general desire to save time and energy, rather than any desire to engage in practices that might suggest fee-splitting between the physician and the hospital, have been the determining factors. And yet, it is equally true that from these ar-

reasons why hospitals do not care to relinquish either their ownership of their physical facilities of the radiologic departments or the salary basis for remuneration of their radiologists.

Elimination of Salary Basis of Payment.— To be sure, accounting problems in this area are notoriously difficult. Whenever allocations of general charges are to be made against departments in an organization, controversies are bound to ensue, and the process of reaching agreements among all parties in interest is sometimes painful and long and, at times, entirely disappointing. Is it any wonder that hospitals which have been accustomed to deficits over long periods of years, even though temporarily they are balancing their books in black rather than in red, are fearful about multiplying their problems by facing the issue we are here discussing, even though I must again insist that in my opinion the hospitals should frankly and with complete sincerity face the necessity for a complete reorganization of many of our present-day procedures? The hospitals have insisted that to effect this we need a breaking away from the salary basis of all of these physicians who are rendering general service. They point out that if the radiologist and the other physicians giving such general service desire to place their services on the basis of a personal relationship with the patient, the first step will be the elimination of the salary basis of payment. It seems difficult for hospital administrators to accept a double system of remuneration for the radiologist and for physicians similarly placed, that is, a salary and, in addition, the right to submit statements to individual patients for individual services. The simplest solution of the basic difficulty would seem to be that the radiologist agree that a salary basis for all except those who are serving on full time will be discontinued and that all clinicians who devote part of their time to a particular hospital will submit statements to individual patients, except in those instances in which the hospital is giving entirely free services to a particular patient. For those who are paying part-pay hospital rates, the honorarium of the radiologist will be adjusted. At one of the numerous conferences held on this topic, one of the consultants thought that such a basis would be acceptable to the radiologist if the hospital would agree. Representatives of the hospitals retorted that the hospitals would have little difficulty in adjusting charges to a changed program, but they lear the radiologists would not agree since, without doubt, a statement of fees sent to individual patients by the individual radiologist would tend to reduce the demand for radiologic service, thus imperiling not only the safety of the patient but

also the income of the radiologist himself, not to speak of the reduction in the income to the hospital. Unfortunately, on such a proposal or similar ones, it is difficult to secure unanimity of opinion from the radiologists themselves. The radiologists hope, therefore, that the hospitals may take the initiative in the matter and may desist from appointing radiologists, pathologists, anesthetists, physiotherapists, and laboratory physicians on a salary basis. It has been suggested, furthermore, that when the radiologist cannot collect a fee from the indigent, or the medically indigent, the hospital should pay an adjusted fee on the theory that it is the hospital which is offering free or part-pay care to the indigent and the medically indigent. And so we have suggestions and countersuggestions, all, in the last analysis, reducible to this problem, since there is agreement upon the basic principle should the initiative in the application of the principle come from the radiologist or from the hospital. The hospitals contend that they would be willing to take the initiative if there were unanimity among the radiologists; the radiologists contend that they would take the initiative if they could be made to feel sure that there is unanimity among the hospitals.

#### Group Hospitalization

May I say just a few words more on potential controversies of the point which we are discussing within the Blue Cross Plans? It is a well-known fact that a Blue Cross Plan which merits the approval of the American Hospital Association must have the approval of the local medical society. As a matter of fact, a large number of these plans owe their initiation to the aggressiveness and planning of the local medical society. For this reason, it is assumed that the program of approved Blue Cross Plans is supervised in many instances by representatives of the local medical society and that these representatives share in a measure in the responsibility for the operation of the plan. Yet, we are told, that of the seventy-seven Blue Cross Plans approved by the American Hospital Association. half of them guarantee medical service to their subscribers. The attitude taken by the Blue Cross Plans in general is that in the operation of their respective plans they will not alter the existing admission or administrative policies of their participating hospitals. In those hospitals, therefore, in which radiologic service is included in the per diem rate, the Blue Cross Plans accept such inclusion in announcing the benefits to the subscriber for which they give remuneration to the hospital. In those hospitals, however, in which radiologic service is treated as an extra charge by the hospital, the

hospital is entitled to some remuneration for the use of laboratory equipment, whether it be in the biochemical laboratory, the bacteriologic, the radiologic, or the physiotherapy laboratory. It is entitled to some return on the space occupied by these laboratories, and it is even more entitled to a return for the salaries and, in some cases, for the maintenance of the technical personnel in these various fields. It is difficult to conceive, therefore, that the hospital will relinquish a right to a return from the patient for some of these expenditures. It is hard, therefore, to conceive how the hospital will give up some form of a charge for the laboratory fee either separate from the room rental or included in an overall blanket per diem payment for hospital facilities. Probably this multiplication of statements which has been suggested will have the unquestioned effect of reducing requisitions for laboratory studies and for diagnostic and therapeutic procedures.

Where Does Medical Responsibility End?— But there are other considerations, both theoretical and practical in nature, which, it would seem, can make an early solution of this problem extremely difficult. I refer here to the very great difficulty in knowing always where medical responsibility ends. I wish to insist that I am far from advocating a narrow definition of medical responsibility. I cannot find myself in accord with the point of view of those who would draw too fine a line between medical responsibility and a technologic procedure. Posturing of a patient in the radiologic laboratory is often regarded as the responsibility of the technician. She is taught posturing by elaborate demonstrations and explanations, and yet no one with even unlimited experience knows in how many phases of the posturing process a measure of medical responsibility, and sometimes an extremely great measure, is involved. Similarly, the physiotherapy technician has been entrusted with responsibilities which, to me, are at times appalling. Sometimes even seemingly nonsignificant procedures and massage imply, on closer analysis, a degree of medical responsibility which is far greater than the responsibility implied in the writing of many a prescription, yet too facilely altogether we regard prescription writing as medical practice and massage as the legitimate province of the technologist.

Instances of my meaning need not be multiplied before this audience. Suffice it to say that if we really could supply physicians for all the areas in which a measure of medical responsibility is exercised, many a procedure in medical practice today would have to be greatly modified and the supply of physicians would have to be greatly increased. In this very respect, there

are crucial and, in some instances, critical problems which confront us just in this day when nurses, technicians, social workers, and others are invading the field of medical practice under the enormous pressures of today's needs. What answer the future will hold for this very real and practical difficulty it is today too early to tell.

We need clarification of issues at a thousand points. It seems almost ridiculously undignified that the physician, with his high competence and his professional devotion to the practice of medicine, must defend his rights to sound medical practice against the regiments of those who have been trained none too well in theory and scarcely better in skills in some limited field of care for the sick human being. But such are the times in which we are living.

The Hospital's Financial Problems.-The hospital is concerned also with financial returns. It has been urged by sincere defenders of sound medical practice that the hospitals had exploited their radiologic departments and that the hospitals are using their profits from the conduct of the radiologic departments for covering their losses in the conduct of other departments. This charge is not made as frequently with reference to the laboratory or the physiotherapy department or the department of anesthesia. It seems that the radiologic department must bear the chief brunt of this accusation. There may be behind such thinking some measure of misunderstanding regarding financial administration. It would complicate administration beyond measure if every department of the hospital were or had to be a self-liquidating department. In fact, the modern hospital is a reality and renders such remarkable service to a large extent because the returns from one department can be used to defray the expenses of another. As a matter of fact, some hospital departments taken by themselves and not as a part of the whole organization are not able to earn an independent departmental income. It is abundantly clear, therefore, that if all departments of the hospital were permitted to charge for their services only what is actually expended in each department, the hospital, as we understand it today, would cease to exist. Despite all of this, it must be admitted that radiologic charges in some hospitals are probably unwarranted. To suggest this as a general charge against radiologic departments, however, is also an unwarranted generalization. The radiologist enters into this situation as the exploited victim, the contention being that he is in some instances not adequately paid for his services when these services are measured in terms of departmental income. It is contended that that is one of the

reasons why hospitals do not care to relinquish either their ownership of their physical facilities of the radiologic departments or the salary basis for remuneration of their radiologists.

Elimination of Salary Basis of Payment.— To be sure, accounting problems in this area are notoriously difficult. Whenever allocations of general charges are to be made against departments in an organization, controversies are bound to ensue, and the process of reaching agreements among all parties in interest is sometimes painful and long and, at times, entirely disappointing. Is it any wonder that hospitals which have been accustomed to deficits over long periods of years, even though temporarily they are balancing their books in black rather than in red, are fearful about multiplying their problems by facing the issue we are here discussing, even though I must again insist that in my opinion the hospitals should frankly and with complete sincerity face the necessity for a complete reorganization of many of our present-day . procedures? The hospitals have insisted that to effect this we need a breaking away from the salary basis of all of these physicians who are rendering general service. They point out that il the radiologist and the other physicians giving such general service desire to place their services on the basis of a personal relationship with the patient, the first step will be the elimination of the salary basis of payment. It seems difficult for hospital administrators to accept a double system of remuneration for the radiologist and for physicians similarly placed, that is, a salary and, in addition, the right to submit statements to individual patients for individual services. The simplest solution of the basic difficulty would seem to be that the radiologist agree that a salary basis for all except those who are serving on full time will be discontinued and that all clinicians who devote part of their time to a particular hospital will submit statements to individual patients, except in those instances in which the hospital is giving entirely free services to a particular patient. For those who are paying part-pay hospital rates, the honorarium of the radiologist will be adjusted. At one of the numerous conferences held on this topic, one of the consultants thought that such a basis would be acceptable to the radiologist if the hospital would agree. Representatives of the lospitals retorted that the hospitals would have little difficulty in adjusting charges to a changed program, but they fear the radiologists would not agree since, without doubt, a statement of fees sent to individual patients by the individual radiologist would tend to reduce the demand for radiologic service, thus imperiling not only the safety of the patient but also the income of the radiologist himself, not to speak of the reduction in the income to the hospital. Unfortunately, on such a proposal or similar ones, it is difficult to secure unanimity of opinion from the radiologists themselves. The radiologists hope, therefore, that the hospitals may take the initiative in the matter and may desist from appointing radiologists, pathologists, anesthetists, physiotherapists, and laboratory physicians on a salary basis. It has been suggested, furthermore, that when the radiologist cannot collect a fee from the indigent, or the medically indigent, the hospital should pay an adjusted fee on the theory that it is the hospital which is offering free or part-pay care to the indigent and the medically indigent. And so we have suggestions and countersuggestions, all. in the last analysis, reducible to this problem, since there is agreement upon the basic principle should the initiative in the application of the principle come from the radiologist or from the hospital. The hospitals contend that they would be willing to take the initiative if there were unanimity among the radiologists; the radiologists contend that they would take the initiative if they could be made to feel sure that there is unanimity among the hospitals.

#### Group Hospitalization

May I say just a few words more on potential controversies of the point which we are discussing within the Blue Cross Plans? It is a well-known fact that a Blue Cross Plan which merits the approval of the American Hospital Association must have the approval of the local medical society. As a matter of fact, a large number of these plans owe their initiation to the aggressiveness and planning of the local medical society. For this reason, it is assumed that the program of approved Blue Cross Plans is supervised in many instances by representatives of the local medical society and that these representatives share in a measure in the responsibility for the operation of the plan. Yet, we are told, that of the seventy-seven Blue Cross Plans approved by the American Hospital Association. half of them guarantee medical service to their subscribers. The attitude taken by the Blue Cross Plans in general is that in the operation of their respective plans they will not alter the existing admission or administrative policies of their participating hospitals. In those hospitals, therefore, in which radiologic service is included in the per diem rate, the Blue Cross Plans accept such inclusion in announcing the benefits to the subscriber for which they give remuneration to the hospital. In those hospitals, however, in which radiologic service is treated as an extra charge by the hospital, the

radiologic service is subject to special remuneration by the Blue Cross Plans. It is said that some of the approved Blue Cross Plans have insisted upon the inclusion of radiologic service even when in the locality or in the particular hospital such inclusion was not part of the general administrative policy. It is contended, therefore, that "group hospitalization comes in and cements a branch of medicine as a part of hospital care and guarantees to subscribers not only bed, food, and nursing care but also the services of the doctor." It is contended that "inclusion of x-ray service in Hospital Service Plans . . . inevitably leads to deterioration of quality in radiologic care. There is overutilization of the radiologist's service with a lick and promise type of radiologic care."

"Subscriber's Contract Should Exclude All Medical Services."—Needless to say, in these few sentences we have attempted to summarize controversial matters upon which there is considerable disagreement not only with reference to points of view but even with reference to facts.

The American Medical Association is said even to this day to stand firmly by the report of its Bureau of Medical Economics made in 1937 in which ten principles of organization and administration were recommended for guidance in the establishment and direction of group hospitalization plans. The fourth principle bears upon the subject of our discussion. It reads, "The subscriber's contract should exclude all medical services-contract provisions should be limited exclusively to hospital facilities." In evaluating the merits of the two sides of the controversy, the case for the physician and the case for the hospital are acutely accentuated both in the form of organization and in the administration of the Blue Cross Plans, since it is through the operation of the Blue Cross Plans that physicians and hospitals come into another intimate touch one with the other. It is probable that the functioning of the Blue Cross Plans introduces no new factor in the controversy except perhaps that the right of the American Hospital Association to approve a Blue Cross Plan which includes a contestable form of medical service rendered under the auspices of a hospital may be questioned. The answer of the Blue Cross Plans to this point is that they will accept whatever procedure the individual participating hospital will adopt under the direction and supervision of the local medical society. The hospitals again counter by insisting that they will follow the arrangements suggested by or insisted upon by the medical profession, especially by the radiologist himself.

And so perhaps the controversy reaches back into the fundamentals of the ethical practice of medicine. It is significant that the conclusion of the minutes of one of the recent conferences held upon this point, in which representatives of the trustees of the American Hospital Association and of the boards of the American, the American Protestant, and the Catholic Hospital Associations participated, reads as follows: "There seems to be unanimous agreement that the physician is supreme in the hospital in all matters pertaining to medical service rendered in hospitals."

#### Conclusion

For me, personally, I feel that I can unqualifiedly state my position briefly as follows:

1. The principle of the exclusive autonomy of the physician in rendering medical service to a patient must remain inviolable.

2. The ethical relationships defined in the principles of ethics of the American Medical Association with reference to consultations are sound and are conceived in the best and in the most lasting interests of the patient.

3. The application of these two fundamental principles to the practice of medicine by the physicians who give a general service is beset with numerous difficulties which should, however, with sufficient good will, competence, and sincerity, be resolvable in a manner conducive to the good of the patient and in conformity with elevated ideals in medical practice.

4. Plans should be studied which will make it possible for the hospitals to work towards the elimination of the salary basis of appointment of the pathologist, the radiologist, the laboratory physician, the physiotherapist, and the physician anesthetist, so that these physicians may be in reality and not merely in name free professional and independently responsible agents and not agents of the institution in which they are carrying on their work.

5. A basis or a number of bases should be devised according to which a fair return on its investment and on its operating expenditures in the conduct of the various medical general service departments should be returned to the institution.

6. If these principles are reduced to a practical program, the controversies with reference to these questions which have centered in the Blue Cross Plans can and will be successfully adjusted provided that the Blue Cross Plans adhere firmly to the principle which they have adopted of guaranteeing to the participating hospitals continuing freedom in the formulation and execution of their administrative policies.

### Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this section of the JOURNAL. The members of the committee are Oliver W. H. Mitchell, M.D., Chairman (428 Greenwood Place, Syracuse); George Baehr, M.D., and Charles D. Post, M.D.

#### Joint Meeting of Broome and Tioga County Societies

A SINGLE lecture on "Low Back Pain" by Dr. Byron Stookey, professor of clinical neurosurgery at the College of Physicians and Surgeons of Columbia University, was given before a joint

meeting of the Broome County Medical Society and the Troga County Medical Society.

The meeting was held at the Arlington Hotel in Binghamton on March 14, at S:30 P.M.

#### Forceps Delivery

DOSTGRADUATE education in obstetrics has been arranged for the Saranac Lake Medical Society. The lecture is to be given on April 19, at 8:00 r.s., in the John Black Room, Saranac Laboratory, Saranac Lake.

The title is "Forceps Delivery: Indications, Dangers, and Accomplishment," and the speaker

will be Dr. Harvey B. Matthews, clinical professor of obstetrics and gynecology at Long Island College of Medicine.

This instruction is presented as a cooperative endeavor between the Medical Society of the State of New York and the New York State Department of Health.

#### Cancer Teaching Day in Schenectady

A CANCER Teaching Day will be held at Ellis Hospital in Schenectady on April 20, under the auspices of the Medical Society of the County of Schenectady, the Medical Society of the State of New York, and the New York State Department of Health, Division of Cancer Control.

The afternoon meeting will be called to order at 3:00 r.m. at Ellis Hospital by the chairman of the meeting, Dr. Ellis Kellert, director of the Ellis Hospital Laboratory. The first lecture will be "Modern Trends in Cancer Research," by Dr. William H. Woglom, associate professor of cancer research at Columbia University in New York City. "Tumors of the Peripheral Nerves and the Adipose Tissues" is the lecture which will be delivered by Dr. Arthur Purdy Stout, associate professor of surgery at Columbia University and attending surgical pathologist at Presbyterian Hospital, New York City.

The evening meeting will be held at the Mohawk Golf Club. Dr. Charles E. Rourke, president of the Schenectady County Medical Society, will act as chairman.

Dr. Fordyce B. St. John, professor of clinical surgery at the College of Physicians and Surgeons, Columbia University, and attending surgeon at Presbyterian Hospital, New York City, will speak first, on "Carcinoma of the Stomach—Results of Studies in a Surgical Clinic. The Responsibility of the General Practitioner and the Surgeon." Dr. Hayes E. Martin, assistant professor of clinical surgery at Cornell University Medical College and attending surgeon at Memorial Hospital, New York City, will then deliver a lecture entitled "Tumors of the Major Salivary Glands."

Dinner will be served at the Mohawk Golf Club

at 6:30 p.m.

#### Thursday Evening Series for Madison County

A SERIES of lectures, held on Thursday evenings at 8:00 r.m., has been started in Oneida. They are being given before the Madison County Medical Society at the Hotel Openida in Openida.

"The Diagnosis and Treatment of Pelvic Pain" was the subject of a lecture given on April 6 by Dr. Edward A. Bullard, attending surgeon at Woman's

Hospital, New York City. On April 13, Dr. Albert D. Kaiser, associate professor of pediatrics at the University of Rochester School of Medicine and Dentistry, discussed the topic "Rheumatic Fever—Rheumatic Heart Disease in Children".

Rheumatic Heart Disease in Children."

The lecture on April 20 will be "Management of the Failing Heart," by Dr. Harry Gold, assistant professor of pharmacology at Cornell University Medical College in New York City. On April 27 Dr. Harold D. Harvey, associate in surgery at the College of Physicians and Surgeons, Columbia University will speak on the subject "Problems of Gastric Cancer."

The lectures on penicillin therapy, rheumatic fever—rheumatic heart disease in children, and cancer are provided by the Medical Society of the State of New York in cooperation with the New York State Department of Health.

#### Series on General Medicine for Greene County

HE medical staff of Memorial Hospital of Greene County is receiving postgraduate instruction in general medicine on Thursday evenings at 9:00 P.M. at the Memorial Hospital in Catskill. On March 30 Dr. Laird S. Van Dyck, associate in dermatology and syphilology at New York Post-Graduate Medical School, Columbia University, opened the series with "The Diagnosis and Treatment of Common Skin Diseases (Exclusive of Eczema, Drug Eruptions, Cancer, and Syphilis). The lecture on April 27 will be "What Do We Know About Vitamins?" and the speaker will be Dr. David K. Miller, professor of medicine in the University of Buffalo School of Medicine.

"The Diagnosis and Treatment of Head Injuries" is the topic for May 25, and Dr. Wallace B. Hamby, professor of neurologic surgery in the University of Buffalo School of Medicine, will speak. In June 29 the lecture, "Circulatory Disturbances in the Extremities," will be delivered by Dr. A. Wilbur Duryce, associate clinical professor of medicine at the College of Physicians and Surgeons of Columbia University.

The lectures "What Do We Know About Vita-mins?" and "The Diagnosis and Treatment of Head Injuries" are provided jointly by the Medical Society of the State of New York and the New York State

Department of Health.

#### Cortland County Hears Two Speakers on General Medicine

TWO sessions on general medicine have been arranged for the Cortland County Medical Society, to be held on Friday evenings at 8:30 p.m. at the Cortland County Hospital in Cortland. On April 21 Dr. Harold J. Stewart, associate professor of medicine at Cornell University Medical College,

will speak on "The Use of the Electrocardiogram in Heart Disease."

On May 19 "Asthma" will be the topic discussed by Dr. Stearns S. Bullen, assistant professor of medicine at the University of Rochester School of Medicine and Dentistry.

#### Malaria and the Dysenteries

LECTURE on tropical medicine was presented A LECTURE on tropical medical Medical Society on April 13. The meeting was held at 1:00 P.M. at the Baron Steuben Hotel in Corning.

"Malaria and the Dysenteries" was the title of the lecture, which was presented by Dr. Stockton Kimball, associate in medicine and pharmacology at the University of Buffalo School of Medicine.

This instruction was presented as a joint en-deavor between the Medical Society of the State of New York and the New York State Department of Health.

#### EXHIBITION OF "OCCUPATIONAL THERAPY IN WAR AND PEACE" IN PHILADELPHIA

The country's most representative exhibition of "Occupational Therapy in War and Peace" will be staged at the Philadelphia Art Alliance from April 17 to May 30, it is announced by John F. Lewis,

Jr., president.
Mrs. Franklin D. Roosevelt will officially inaugurate the exhibition, which was formed in cooperation with the hospitals of the U.S. Armed Forces, on Monday evening, April 17. Dr. Edward A. Strecher, Consultant to the Surgeon General of the U.S. Navy, and consultant to the Secretary of War, U.S. Army, and Army Air Forces, will also participate in the evening's ceremonies, which will be broadcast by a national radio network.

This exhibition will be the first large exhibition of occupational therapy, or "Cure Through Work," ever staged in Philadelphia, and it will be the first showing of the therapeutic work among the disabled members of the Army, Navy, and Air Force ever combined anywhere.

Every gallery and showcase in the Art Alliance

will be taken over for the six weeks by this show. Regular demonstrations by actual occupational therapy patients will be given for the benefit of the visiting public in the various rooms of the Art Alliance

In addition, several afternoon and evening events during April and May will treat the many facets

of the subject. One gallery will house a model occupational therapy shop such as might be found in a civilian hospital, with finished and unfinished handicraft Visitors will be permitted to try their hand on view.

at the weaving looms, block printing, sketching, cord knotting, rug hooking, and wood carving.

Incapacitated patients will demonstrate in this

shop every Saturday afternoon and at that time the director, Miss Wellman, will be on hand to answer questions.

In another gallery of the Art Alliance, which will be set up as a functional shop, service patients from the Valley Forge General Hospital and the U.S. Naval Hospital will demonstrate the crafts which introduce exercise. These demonstrations will be held on Tuesday afternoons.

The Art Alliance's regular Decorator's Gallery will be converted into a modern living room whose entire furniture and furnishings have been constructed by occupational therapy patients in Army, Navy, and civilian institutions. These furnishings will include curtains, upholstery, carved chairs, game tables, a modern chest table, rugs, bookends, ashtrays, lamps, and wall paintings.

Other exhibitions will feature occupational therapy working materials, finished products, large photographs of patients at work and of their prog-

ress, and civilian-made articles for a sale.

ress, and civilian-made articles for a sale.

During the six weeks, all of the Art Alliance events will center about occupational therapy. These will take in Army and Navy technical discussions, talks on "Design in Salvage," "Music Therapy," "Creative Stitchery," "Group Occupational Therapy in Group Psychotherapy," "Occupational Therapy in the Pacific Area," Rythmic Exercises for Amputees," and three films from the British Information Service. British Information Service.

#### Medical News

#### A.M.A. Public Relations Council Opens Washington Office

It will be good news to our membership that a Washington Office has been established by the Council on Medical Service and Public Relations of the A.M.A. under the chairmanship of Dr. Louis H. Bauer. The office has been opened in the Columbia Block of the Doctors' Hospital at 1835 Eye Street, N.W., Washington, D.C., Suite 900. A secretary

has been engaged and two telephones are available.

Under an arrangement with the Medical Society of the State of New York, Dr. Joseph Lawrence, Executive Officer of the Society, is acting for the time being in the capacity of consultant and is spending about half of his time in Washington. His long experience as director of the Albany office of the New York State Society should assure the success of the Washington office of the A.M.A. if the proper and necessary facilities are made available. The office is already busy establishing contact with the legislative and public relations committees of the various States of the Union. Dr. G. Lombard Kelly is the permanent secretary. He will spend part of his time in Washington and part in Chicago.

#### New Medical Student Class Cut 50 Per Cent by Army

AS A RESULT of new regulations by the War Department, medical and dental schools throughout the country will suffer a 50 per cent reduction in the Army quota of students scheduled to enter next year. . . . Instead of assigning 5,800 medical and dental students, as originally planned, the Army will admit only 2,800 for the term beginning in January.

Specifically, the quota for medical schools has been cut 55 to 28 per cent and that for dental institutions 35 to 18 per cent. These proportions are expected to be further reduced later. No quota has been established for 1946, Col. Francis M. Fitts, chief of the medical section, Army Specialized Training Program, disclosed. The number of Army men assigned. signed to medical schools at that time will depend

on existing needs.

A serious shortage of doctors in the future, together with a substantial reduction in the number of medical and dental students during the next few Years, will result from the War Department's action, warned Dr. Willard C. Rappleye, dean of Columbia University's medical school and chairman of the executive council, Association of American Medical Colleges.

Despite the urgent need for doctors now and in the postwar period, the decreased assignments by the Army will mean that the medical schools will face a loss of 30 per cent or more in student enrollment, Dr. Rappleye predicted. He pointed out that under the pressure of the manpower shortage it may prove difficult to get a sufficient supply of civilian students.

difficult to get a sufficient supply of civinan students. "The opinion now is that we will not have enough students to fill our classes after this year," Dr. Rappleye said. "This will mean fewer potential doctors. The only group to which we would have any access would be those under 18 years of age."

He foresame a socious shortage three years from

He foresaw a serious shortage three years from now, with about one-third fewer medical graduates than had been scheduled under the previous arrangement. In some States, Dr. Rappleye declared, it is difficult to get deferments for the medical students. That will complicate the situation.

In a memorandum to the medical school deans of

the country, Dr. Rappleye notified the administrators that the Army's decision will increase the percentage of civilian students from 20 per cent to 47 per cent unless the Navy increases its quota. The long-term need of medical officers for the Navy will continue and probably increase and that for the Army will diminish, in the light of present calcula-

tions, the memorandum suggested.

Because of the fewer students to be admitted to medical schools, the Association of American Medical Colleges is considering the advisability of returning to its former practice of operating on a twelvemonth rather than a nine-month basis. At present, first-year classes are admitted every nine months. That means four classes will be graduated every three years, thus adding to the number of available doctors. The regular medical program has been accelerated from four to three years. The plan to admit first-year classes every nine months will produce 5,000 more medical officers and physicians than normal in the period 1942-1945.

"Now that the Army has decided greatly to reduce its medical trainees beginning with the next entering classes and has indicated that its more distant future needs for medical officers will not be urgent, there appears to be no necessity for admit-ting first-year classes every nine months," the Rap-pleye memorandum declared. "The return of admissions once a year would permit maintenance of standards of medical education now seriously ham-pered by the reduction of instructional staffs as reported by the Association recently. Furthermore, it is probable that the supply of satisfactorily trained civilian premedical students in the future will be insufficient to fill the medical schools every nine

At the same time, the question of returning the internship to twelve months instead of nine was

raised by Dr. Rappleye.

A special meeting of the executive council of the medical association will be held (April 1) in Chicago to consider the new developments and make recom-mendations to the colleges. The question of whether the entrance requirements for civilian students should be raised from two years' college training will be considered. Before the war 98 per cent of the

students had three years' college training.

The reduction in the Army Specialized Training Program has made necessary the modifications in the medical program, Colonel Fitts explained. Only sufficient premedical and predental trainees were "salvaged" to insure filling one-half of the medical and dental vacancies for 1944–1945, he said.

Colonel Fitts revealed that he and Dr. Rappleye had a "long conference" with Selective Service officials concerning the question of occupational deferment for civilian students. He said that "it is hoped by everyone concerned" that a sufficient number of deferments would be made by the local

boards.

"It is absolutely necessary that there be enough men going into medicine," Colonel Fitts maintained.
"The country must take the necessary steps to insure an adequate supply of medical men for 1945 and 1946. Otherwise the number of doctors will be materially decreased at a time when doctors will be necessary."

In his memorandum to the colleges Dr. Rappleye declared that Selective Service headquarters is confident that the civilian students, medical and pre-medical, can be deferred "in order to insure a supply of physicians for the demands of civilian practice, industry, the public health services, and other nonmilitary activities." Special provisions for the United States Veterans Administration are now under consideration.-Reprinted with permission from The New York Times, March 30, 1944

#### Early Diagnosis Campaign of Tuberculosis and Health Association

URING the month of April the New York Tuberculosis and Health Association is conducting an Early Diagnosis Campaign through radio

programs, as well as through other media.

On April 20 at 1:15 P.M. Dr. George D. Cannon, assisting visiting physician at Harlem Hospital, will speak over WNYC on "Present-Day Methods of Treating Tuberculosis." On April 21 at 11:45 A.M. WNYC will feature a talk, "Work Prospects for the Tuberculous," by Miss Ann Lehman, State Supervisor of Selective Placement, U.S. Employment Service of the War Manpower Commission. "Hospital Care of the Tuberculous." by Dr. Williams ("Hospital Care of the Tuberculous") by Dr. Williams ("Hospital Care of the

"Hospital Care of the Tuberculous," by Dr. William G. Childress, physician in charge, Division of Tuberculosis, at Grasslands Hospital, will be broadcast over WMCA at 1:15 p.m. on April 22. On April 24 at 11:45 a.m., WNYC will broadcast "Tuberculosis in Industry." The speaker will be Mr. Bernard S. Coleman, secretary of the Tuberculosis Committee, New York Tuberculosis and Health Association.

Miss Gladys M. Park, R.N., secretary of the Personal Information Service of the New York Tuberculosis and Health Association, will give a talk entitled "Five Thousand Problems" at 1:15 P.M. on April 27, over WNYC. On the same station, April 28 at 11:45 A.M., Dr. Louis R. Davidson, director of surgery at Sea View Hospital, will speak on "Sur-

gery in Pulmonary Tuberculosis."
"Peace Terms with Tuberculosis" will be the topic discussed by Dr. H. E. Kleinschmidt, medical director for the North Atlantic Area of the American Red Cross; the program will be heard at 1.15 per cond-rate of the formal at 1.15 per cond-rate formal program will be heard at 1.15 per cond-rate formal program will be heard at 1.15 per cond-rate formal program will be heard at 1.15 per cond-rate formal program will be heard at 1.15 per cond-rate formal program will be heard at 1.15 per cond-rate formal program will be heard at 1.15 per cond-rate formal program will be heard at 1.15 per cond-rate formal program will be the cond-rate formal program will be cond-rate formal pro be heard at 1:15 P.M. on April 29, on station

#### War Conference on Industrial Medicine, Hygiene, and Nursing

THE second "War Conference" of industrial phy-L sicians, industrial hygienists, and industrial nurses will be held in St. Louis, Missouri, May 8-14, 1944, at the Hotel Jefferson. The participating organizations are (1) American Association of Industrial Physicians and Surgeons, (2) American Industrial Hygiene Association, (3) National Con-ference of Governmental Industrial Hygienists, and (4) American Association of Industrial Nurses; and theirs will be a week-long program of joint and separate meetings.

The medical subjects to be presented include welding, in relation to clinical aspects and control of hazards; noise—medical phases and means of prevention; better health in small plants; the industrial physician's opportunity to advance medical knowledge; maladjustment and job environment; women in industry; and panel discussions on "Who Can Work?" and other timely questions. Two clinics, one surgical, at Barnes Hospital, and the other medical, at Desloge Hospital, will be featured among the morning sessions.

The industrial hygienists will examine the health hazards presented by the new synthetic rubber industry; radium; solvents; the toxicology of TNT; the possibilities of an excessive silica dust hazard from the extensive quartz crystal industry which has

recently sprung up in many areas of the country; technics of air sampling in specific reference to the collection of cutting oil mists and of lead fumes, the latter encountered in soldering operations where the hazard is increasing with lack of adequate tin; and hazards of exposure to cadmium, which is known to be more poisonous than lead, and has begun to

cause a number of cases of poisoning. The industrial nurses will consider postwar planning for nurses and medical services in industry; nursing ethics in industrial work; problems in industrial health and its promotion; the young nurse in the industrial environment, the industrial nurse's part in the rehabilitation of psychiatric problems; wartime industrial health; and industrial nursing

and leadership.

This "War Conference" will present an unequalled opportunity for everyone interested to any degree in industrial health problems—especially those of present wartime exigencies—to hear them discussed by the variance of this by the recognized experts in all departments of this important and growing field.

The Hotel Jefferson offers accommodations, but reservations are coming in very fast. Write to John Reinhardt, Chairman, "War Conference" Housing Bureau, Syndicate Trust Building, St. Louis, Missouri.

#### New York Series of Wartime Graduate Medical Meetings

THE 1944 series of wartime graduate medical meetings, sponsored by the American College of Surgeons, started in March. The remaining processes of the later April and May in the New York in a military in following times and places: tine; and April 27, "Neuropsychiatric Problems in the Army," by Col. William C. Porter, at Camp Shanks, Orangeburg,

April 21, "General Surgical Approach to the Abdomen," Dr. John F. Erdmann; April 28 and May 5, "Disorders of the Low Back," by Dr. Arthur Krida; and May 12 and 19, "Neuropsychiatric Problems in the Army," by Col. Douglas T. Thom, at the Induction Center, Grand Central Palace, New York City. May 9, "Cardiac Pain," by Dr. John J. H. Keat-

ing, at Halloran General Hospital, Staten Island.

#### Father Schwitalla to Speak May 4

GENERAL Service Aspects of Medical Practice in the Hospitals" is the title of an address to be given by The Reverend Alphonse M. Schwitalla, S.J., at a meeting of the Joint Council of Pathologists, Radiologists, Anesthesiologists, and Physical Therapy Physicians on May 4. The address will be delivered at a dinner at the Hotel Commodore in New York City at 7:00 P.M.

This meeting, which is an open one, will replace the usual dinner of the pathologists held during the Annual Meeting of the State Medical Society.

Father Schwitalla is dean of St. Louis University College of Medicine.

He has received widespread appreciation for his lucid analysis of the problems confronting hospitals and the physicians who practice in them.

An article by him entitled "Administrative and Professional Problems of Medical Practice in the Hospitals," reprinted by permission of the Wisconsin Medical Journal, appears on page 894 of this issue of the JOURNAL.

#### A.M.A. Plans Better Distribution of Medical Services

DR. MORRIS FISHBEIN, editor of the Journal of the American Medical Association made the announcement that a committee of the American Medical Association is working on plans for a "better distribution" of medical services, which will be presented to the A.M.A. convention in June.

He spoke before a meeting of doctors and laymen in allied fields, held in New York City on March 8 under the auspices of the National Physicians' Committee for the Extension of Medical Service. His audience included doctors, drug manufacturers, insurance and group health insurance company representatives. He decried any plan for widespread medical service which called for federal control or which had its origin in nonmedical sources.

He said that a new Council on Medical Service of the A.M.A. has been charged with considering the myriad plans for establishing a "better distribution of medical service for more people." In addition, he said that the house of delegates of the A.M.A. will give consideration to technics that promise more medical service to more and more people.

#### Conference on Convalescence and Rehabilitation

THE second national Conference on Convalescence and Rehabilitation will be held on April 25 and 26 at the New York Academy of Medicine, under the auspices of the Committee on Public Health Relations of the Academy and with the financial support of the Josiah Macy, Jr., Foundation. Ranking medical officers of the Army, Navy, Army Air Forces, U.S. Public Health Service, and the Veterans Administration will present the projects in this field

which have been developed in their respective serv-

In addition, discussion will be focused on such fundamental topics as nutrition, motivation, re-training, research, and the role of home, hospital, and industry. Admission will be by invitation. Dr. Oswald R. Jones is the chairman of the committee on arrangements and Dr. E. H. L. Corwin. 2 East 103rd Street, the executive secretary.

#### Physicians' Art Association to Hold Exhibit

The American Physicians' Art Association will have its seventh annual exhibit at the A.M.A. convention, Stevens Hotel, Chicago, June 12-16, 1944.

Through the courtesy of Mead Johnson & Co., Evansville, Indiana, there will be no fees for hanging and no express charges either way. The type of art to be exhibited includes personal work of the following types of medium: oil portraits, oil still life, landscapes, sculpture, water color, pastels, etchings, photography, wood carving, leather tooling, ceramics, and tapestries (needle work).

Exhibitors should send now for entry blanks to Dr. Francis H. Redewill, Secretary, A.P.A.A., Flood Building, San Francisco; one entry blank should be used for each medium in which it is desired to exhibit.

#### Fellowship in Industrial Medicine at the University of Pittsburgh

The School of Medicine of the University of Pittsburch announces that the James S. Kemper Foundation has granted \$2,500 to the Department of Industrial Hygiene for the purpose of establishing a fellowship in industrial medicine. The purpose of the fellowship is to make available to a well-qualified

physician the opportunity to pursue graduate work in preparation for a career in the field of industrial medicine. Details of the fellowship will be made available to interested candidates on communication with the Dean of the School of Medicine, University of Pittsburgh.

#### County News

#### Albany County

Dr. Henry W. Cave, attending surgeon and chief of the first surgical division in Roosevelt Hospital, New York City, was the principal speaker at the meeting of the county society held in Albany on March 22.

Dr. Cave is well known in the medical profession for his practice and writings on ulcerative colitis. which was the subject of his lecture. Discussion of his paper was opened by Dr. C. B. Esselstyn, Hudson, and Dr. W. M. Thomson and Dr. A. M. Yunich. Albany,

#### Broome County

A regular meeting of the Broome and Tioga County medical societies was held in the Arlington Hotel in Binghamton on March 14, at which time the members of the two organizations were the guests of the Endicott Johnson Medical Department. Dinner was served at 7:00 r.m. The scientific program was an address by Dr. Byron Stookey of the New York Neurological Institute of New York City.

#### Chautaugua County

At the scientific session of the Chautaugua County Medical Society, following dinner at 1:00 P.M. on March 16 at White Inn, Fredonia, Dr. David K. Miller, professor of medicine at University of Buffalo, gave a talk on penicillin, based on its use in several cases in Buffalo hospitals. Dr. O. T. Barber, of Fredonia, president of the society, presided.\*

The Jamestown Medical Society held its regular monthly dinner meeting on February 24 in the Hotel Jamestown. Dr. W. G. Hayward presented a paper on "Abdominal Symptoms of Urological Disease," which aroused a lively discussion ably led by Dr. Milton J. Johnson,\*

#### Columbia County

Dr. Werner Muhlfelder, of Chatham, who has enlisted in service and expects to be called in the near future, has made arrangements to have Dr. Zoltan Hervey, of Boston, take over his practice in Chat-

Dr. Hervey was born in Czechoslovakia in 1913. He was graduated from the University of Vienna in 1938. He received training in various hospitals in Vienna and Hungary from 1936 through 1940, and in March, 1940, came to this country.

He received one year of rotating internship at the Chelsea Memorial Hospital, Chelsea, Massa-chusetts, and was resident physician for two and one-half years at the Long Island Hospital, Boston, Massachusetts.

Mrs. Hervey is a registered laboratory technician at the Massachusetts General Hospital, Boston.\*

for fifty-six years,
in Oneida.

Dr. Joseph S. Lawrence, Executive Officer of the Medical Society of the State of New York, was present at this meeting and spoke on "Socialized Medicine and the Wagner-Murray-Dingell Bill."

#### Nassau County

The March meeting of the county society was held in Mercy Hospital Auditorium in Rockville Centre on March 28, under the auspices of the Nassau

County Cancer Committee.

Dr. Elise L'Esperance, founder and director of the Strang Prevention Clinic, Memorial Hospital, New York City, spoke on "Cancer Prevention Clinics." The second speaker was Ethel L. Goodwin, nurse consultant, Nassau County Cancer Committee, whose topic was "The Delay in Making a Diagnosis in Cancer and the Cost to Nassau County of Caring for the Terminal Cancer Patient."

#### New York County

A program on "Plastic and Reconstructive Surger," was presented at the monthly meeting of the county society held on March 27 at the New York

Academy of Medicine.

The four speakers and their topics were: "An Evaluation of Tubed Pedicle Flaps for Burn Scar Contractures of the Chin, Cheeks, and Neck," by Dr. Gustave Aufricht; "Film-Cemented Skin Grafts," by Dr. Jerome P. Webster; "The Correction of Scar Tissue Contraction of the Lids and the Cul-de-Sacs," by Dr. Edmund B. Spaeth (by invitation); and "Plastic Surgery of War Wounds," by Lt. Cel. James Barrett Brown (by invitation).

Marjorie Fish, director of occupational therapy at Columbia University, has been appointed national educational field director of the American Occupational Therapy Association. While she is on leave of abence Miss Marguerite Abbott will direct the work of Columbia's occupational therapy department.

In her new post Miss Fish will work in association with the Surgeon General's Office in appointing occupational therapists to help disabled service men. She also will help to organize Government-subsidized occupational therapy courses and undertake student recruiting and personnel procurement.

Dr. John Frederick Erdmann, who has performed more than 20,000 operations since he began practice in New York in 1887, observed his eightieth birthday on March 27. Several celebrations by hospitals and other organizations marked the occasion, Dr. Erdmann having started the day by performing an operation at 8:30 A.M.

The appointment of Dr. James A. Shannon to be professor of pharmacology and chairman of the department of pharmacology in the New York University College of Medicine upon the retirement next September of Dr. George B. Wallace has been an-

nounced by Dr. Donal Sheehan, acting dean of the

Dr. Shannon, who has been an associate professor of medicine at New York University since 1942, was educated at Holy Cross College, where he obtained his A.B. degree in 1925. He received his M.D. degree from the New York University College of Medicine in 1929 and his Ph.D. from the same institution in 1935.

After graduation he interned at Bellevue Hospital. In 1936 he carried on postgraduate work in Sweden and Cambridge, England, on the function of the kidney. He was appointed to the visiting staff of the Third Medical Division of Bellevue Hospital and in 1941 was made Research Director of the Third Division of the Goldwater Memorial Hospital.

He has published extensively in the field of renal physiology and at present is devoting all his time to the development of more effective means for the suppression and treatment of malaria under the auspices of the Office of Scientific Research and Development.

He is a member of the American Physiological Society, the American Society for Clinical Investigation, and is on the editorial committee for the Proceedings of the Society for Experimental Biology and

Medicine.

The New York Council of Surgeons is offering a free ten-week refresher course for physicians. The sessions, which began on April 4, are held on Tuesdays from 11:00 a.m. to 12:00 noon at Parkchester General Hospital, 1425 Zerega Avenue, Bronx 61, New York.

At a recent meeting of the Russian Medical Society the following officers were elected for 1944-1945: president, Lazar S. Rosenthal; vice-president, Raphael G. Stoliarsky; corresponding secretary, Benjamin O. Alpern; recording secretary, Sergei S. Krasnitski; treasurer, Gagik S. Agadjanian. The following physicians were elected members of the Executive Committee: G. Altschuller, L. Brown, I. Glassman, A. Tolstoouhov.

The scientific meetings of the Society are held every fourth Tuesday of the month at Squibb Hall,

745 Fifth Avenue.

A special bulletin to the JOURNAL from the Headquarters of the European Theater of Operations, U.S. Army, reveals that Capt. Charles H. Fliegelman, of 127 West 79th Street, New York, found one familiar feature while attending a school opened recently at a large United States Army station hospital in England.

Capt. Fliegelman discovered that he was again under the tutelage of a former instructor, Col. Joseph Haas, Medical Corps, who this time was commanding officer of the hospital. Capt. Fliegelman formerly had been assistant to Col. Haas as chief of urology and related surgery for several years on New York hospital staffs.

Capt. Fliegelman, a native of New Hampshire but resident of New York City for the last twenty years, was graduated from the College of the City of New York with a Bachelor of Science degree in 1925. He received his medical degree at the Long Island College Hospital, Brooklyn, and interned two years at Morrisania City Hospital, New York City. He has continued as a member of the staff of that hospital and of the Jewish Memorial Hospital, New York City.

As its twentieth annual benefit production of Gilbert and Sullivan operettas, the Blue Hill Troupe -one of New York's best-known companies of amateur Savoyards—will present performances of "H. M. S. Pinafore" and "Trial by Jury" on the evenings of April 20, 21, and 22, as well as a children's matinee on April 22, at the Heckscher Theater. In accordance with its long-established tradition the troupe will donate to charity all proceeds above production costs, the beneficiary this year being the New York City Cancer Committee.\*

#### Oneida County

Maj. Howard P. Lewis, chief of medical service in Rhoads General Hospital, spoke on "Practical Objectives in the Diagnosis of Valvular Heart Disease" at a meeting of the Utica Academy of Medicine on February 17 in Utica.

Dr. Walter F. Duggan, Utica, also was a speaker.

His topic was the treatment of glaucoma. Discussions followed each address. Dr. Robert C. Hall pre-

Capt. Gerald F. Jones, who was a practicing physician in Utica for ten years until he enlisted in the Army Medical Corps in 1942, gave a talk on his experiences as "A Battalion Surgeon in India" to members of the Utica Torch Club on February 21.

He was on duty nine months in India. Last November he returned to Utica on assignment to the staff of Rhoads General Hospital.\*

Dr. G. E. Haggart, orthopaedic surgeon of the Lahey Clinic, Boston, was the speaker at the March meeting of the Utica Academy of Medicine on March

Dr. Haggart's subject was the diagnosis and treatment of low back pain and sciatic pain. cussion was opened by Dr. Charles Hume Baldwin.\*

#### Ontario County

Dr. Alfred Wedd, of Rochester, was guest speaker at the March meeting of the Canandaigua Medical Society in the Canandaigua Hotel on March 9. His subject was "Coronary Artery Syndrome."

Dr. James F. Maltman was the host. Dinner was served at 6:15.\*

#### **Oueens County**

A joint meeting of the organized medical and dental professions of Queens County was held in the County Society Building on March 28 at 9:00 P.M.
"Medicine and Dentistry in the Days Ahead"

was the subject of an address by Capt. C. Raymond Wells, D.D.S. Dr. Douglas B. Parker, D.D.S., gave the second address, entitled "Medicodental Cooperation in Professional Practice."

A dinner was held at the Forest Hills Inn preceding the meeting. Members of the woman's auxiliary

were invited guests.

The Friday Afternoon Lecture on April 21 will be "Clinical Problems of Jaundice" by Dr. Sol S Lichtman, associate visiting physician, New York Hospital, and adjutant attending physician, Mt. Sinai Hospital.

#### Schenectady County

The regular monthly meeting of the county society was held in Schenectady in Ellis Hospital

Library on March 7 at 8:30 P.M.

The subject was "Assessing the Physical Conditions of Children in Health and Disease," and the speaker was Dr. Norman C. Wetzel, associate professor of pediatrics, Western Reserve University, and attending physician, University Hospitals, Cleveland, Ohio. Discussions were by Drs. J. J. York and D. E. Nitchman.

#### Westchester County

"Atypical Pneumonia in the Army" was the title of the scientific address at the regular meeting of the county society on March 21. The speaker was Dr. Alexander Langmuir of the Army Commission on Acute Respiratory Disease.

Wing Commander R. W. Durand of the R.A.F. and Sister Barnes, heading the hospital unit of a British ship which was recently undergoing repairs in a United States port, spent their three-week shore leave in voluntary service at Westchester's Grasslands Hospital. A dinner held in their honor on March 10 was attended by more than sixty county physicians, who heard Commander Durand relate his experiences in the service. County Public Welfare Commissioner Ruth Taylor and Dr. E. L. Harmon, director of Grasslands Hospital, expressed gratitude for the voluntary work done at the Hospital by the two British workers.

The Westchester Medical Veterans' Loan Fund has been set up by members of the Medical Society of the County of Westchester. The fund will be available for returning members of the service to aid in re-establishing their private practice or to serve other needs.

The New Rochelle Medical Society held a dinner meeting on Tuesday, February 15, at the Wykagyl Country Club. The meeting was a testimonial in honor of Dr. Frank B. Littlewood, who has just completed fifty years of medical practice in New Rochelle. The feature of the evening was an address by Dr. Littlewood, in which he reviewed his experiences and contrasted the conditions of medical practice fifty years ago with those of today. Following Dr. Littlewood's address, the president of the Society, Dr. Reid R. Heffner, introduced Dr. C. C. Guion, who presented Dr. Littlewood with a gift from the society, and brief addresses in tribute to Dr. Littlewood were given by Dr. Guion, Dr. E. Leslie Burwell, Dr. August L. Beck, Dr. Charles Ogilvy, Mr. Alex Norton, superintendent of the New Rochelle Hospital, Dr. Eugene Morrison, and others.

Dr. Burwell presented a gift to Mr. Hans Koehler, local pharmacist, who was also a guest of honor of the Society, in recognition of his having completed

fifty years of pharmaceutic service in New Rochelle.

#### DR. ADAIR NEW HEAD OF CANCER SOCIETY

Dr. Frank E. Adair, surgeon at the Memorial Hospital and chairman of the Cancer Committee of the American College of Surgeons, was elected president of the American Society for the Control of Cancer at the close of its thirty-first annual meeting held on March 11 at the Biltmore Hotel in New York City.

Dr. E. P. Lehman, director of the Virginia Cancer Foundation, was elected vice-president, and Dr. Eugene Pendergrass, Professor of Radiology at the University of Pennsylvania Medical School, was named secretary. Dr. Herman C. Pitts was elected chairman of the board of directors, Charles D. Hilles, assistant secretary, and Alan M. Wood, assistant treasurer.

Elected to the executive committee were Dr. James B. Murphy, in charge of cancer research, Rockefeller Institute; Dr. Cornelius P. Rhoads, former director of Memorial Hospital, now in the Army; Dr. John J. Morton, Professor of Surgery, Rochester (N.Y.) School of Medicine; Dr. George

M. Smith, Department of Anatomy, Yale University; Dr. Edwin B. Wilson, Professor of Vital Statistics. Harvard University School of Public Health.

tistics, Harvard University School of Public Health. Dr. Clarence C. Little, managing director of the Society, reported that less than \$2,000,000 was spent annually for cancer research. He said that the American public was contributing less than 50 cents a case toward cancer control work, "despite the fact that cancer is the nation's second highest cause of death." He emphasized that programs of cancer research in many parts of the country are being "greatly handicapped" by lack of funds.

Mrs. Harold V. Milligan, national commander of the Women's Field Army, said that Alabama last year made greater progress from an organizational and financial standpoint than any other state. She said that the Army's major objectives during 1944 would be to interest more men in cancer-control work, intensify efforts to teach cancer facts to children, and to work toward the establishment of more cancer-prevention clinics.

#### FORTY YEARS OF SERVICE

"This week the Council on Pharmacy and Chemistry of the American Medical Association enters its fortieth year of service to the public and the medical profession," the Journal of the Association for February 12 says. "Since its first meeting on February 11, 1905, the Council has fought continuously for rational therapeutics. It has created much change in the practice of therapeutics. Its activities and decisions are highly respected and are followed internationally by leading medical authorities; its advice is sought frequently by administrative, advisory, and educational bodies in this country and in others.... It is fortunate indeed for the public and the medical profession that there exists an unselfish body such as the Council which can give scientific consideration to rational therapeutics and issue its statements without fear or favor."

#### DEAN DEPLORES CONFUSING LANGUAGE

Dean Virginia Gildersleeve of Barnard College told graduates of the Dwight School for Girls at commencement exercises last spring that the nation needs more persons who knew reading, writing, and arithmetic, particularly those who could use English that was "simple and to the point"

and arithmetic, particularly those who could use English that was "simple and to the point."

She said "even some persons in high places" in Washington and New York did not know how to use the language "without confusing the public." In this respect she referred to civilian protection signs in store windows stating: "Illumination is required to be extinguished before these premises are closed to business." She suggested that "Put out your lights before closing the store" would have been better. The store signs are displayed "By Order of City of New York, Department of Water Supply, Gas, and Electricity."

## Woman's Auxiliary

#### To the Medical Society of the State of New York

#### Convention

REETINGS to all Auxiliary members and doctor's wives!

Again it is our privilege to welcome you to New York City for the Annual Convention of the Woman's Auxiliary to the Medical Society of the State of New York. This year our headquarters will be the Hotel Pennsylvania, the time May 8-11, inclusive. The Hotel Pennsylvania will have accommodations for all if reservations are sent in early. All functions will be informal; therefore short dresses will be in order. All doctors' wives, whether Auxiliary members or not, are cordially invited to attend the House of Delegates meetings and all social functions.

The Convention Committee will be on hand Sunday, May 7, to greet those who arrive early.

Your hostesses, the Kings, Queens, Nassau, and Suffolk County Auxiliaries, are looking forward to having each and every one of you at the Convention. Write to Miss Sue Braslow of the Hotel before

April 20 for reservations. Get your reservations in Sincerely,

MILDRED E. St. JOHN Convention Chairman

#### County News

Albany.-Mrs. John E. Heslin was very active in assisting in the Fourth War Loan Drive. Mrs. Albert Yunick, another member of the Auxiliary, has also been playing an active role in the Fourth War Loan Drive.

Broome.—The February meeting was held at the home of Mrs. John II. Robertson in Binghamton. Dr. Victor W. Bergstrom gave an analysis and discussion of the Wagner-Murray-Dingell bill. After a short business session, Mrs. Robertson reviewed the book Tomorrow is Forever by Gwen Bristow. At the March meeting, in the Nurses' Home of the Charles S. Wilson Memorial Hospital, Johnson City, the Nurses' Glee Club gave a short concert, after which an interesting talk was given on "The Romance of Jewels" by Mr. Kenneth Van Cott of Binghamton. Columbia.—The March meeting was a business

meeting. Luncheon and cards were enjoyed at 10 McKinstry Place, Hudson. Mrs. L. J. Early is the

program chairman.

Onondaga.—The season opened with a meeting at the home of Mrs. Charles D. Miller. The wives of all members of the State Medical Society now serving in the armed forces were guests at this meeting. Christmas party was held at the home of Mrs. John Buettner. A program of Christmas carols was presented by Mrs. Harry L. Gilmore, coloratura soprano. Mrs. Gilmore is one of the auxiliary members. Miss Hazel Armitage and Mrs. Grace French Tooke assisted Mrs. Gilmore. The Wagner-Murray-Dingell bill was discussed under the able leadership

of Mrs. Gerald Cooney, legislative chairman of the Onondaga County Auxiliary. A social hour followed this discussion.

A luncheon meeting was held in the Roof Garden of the Onondaga Hotel, in Syracuse, in February, Mrs. Beuttner and Mrs. Cooney acting as cochairmen. Guests were Dr. Leo Gibson, Dr. Dwight V. Needham, president of the Onondaga County Medical Society, and Dr. William Groat and Dr. John Buettner, advisers of the auxiliary. Dr. Gibson, chairman of a special insurance committee set up by the State Medical Society, spoke on "Medical Indemnity Insurance" and gave an outline of the plan which has been approved by the county society, known as "Surgical Care, Inc., of Central New York."

On March 14 a luncheon meeting was held at the Onondaga Hotel. Miss Edith Smith, dean of the Syracuse University School of Nursing, spoke on

the Cadet Nurse Training Program.

Rensselaer. Mrs. Joseph Lasko presided at a luncheon and business meeting held in the Marine Room of the Annex in Troy. Mrs. John J. Noonan and Mrs. Warren St. John were selected as delegates to the Annual Convention. Mrs. Charles A. Krauss and Mrs. Minnie Standard were named as alternates. Dr. Joseph S. Lawrence spoke at the last meeting again, opposing the Wagner-Alurray-Dingell bill. At the conclusion of Dr. Lawrence's talk, tea was served. Mrs. John J. Noonan and Mrs. Augustus J. Hambrook presided at the tea table. Mrs. Warren St. Lich was chairman of the tea. ren St. John was chairman of the tea.

#### MENTAL HYGIENE GROUP ELECTS THREE NEW MEMBERS

The election to membership on the National Committee for Mental Hygiene of Mrs. Anna M. Rosenberg of New York, regional director of the War Manpower Commission for New York City, and Mr. and Mrs. Harry Frank of Kintnersville, Pennsylvania, of the committee's vocational adjustment bureau, has been announced.

#### SUBSTITUTE FOR TALC ON RUBBER GLOVES

Re-emphasizing the very serious surgical hazard from the use of tale as a dusting powder for rubber gloves, M. G. Seelig, M.D., D. J. Verda, M.D., and F. H. Kidd, M.D., St. Louis, recommend in the Journal of the American Medical Association for December 11, 1943, that potassium bitartrate be used as a substitute.

### Additional Annual Reports

### To the 1944 House of Delegates Medical Society of the State of New York

#### Report of the Planning Committee for Medical Policies

To the House of Delegates; Gentlemen:

Organization .- In accordance with the mandate of the House of Delegates in 1943 the Committee on Planning for Medical Policies was organized. The President, Dr. Thomas A. McGoldrick, the President-Elect, Dr. Herbert H. Bauckus, the Secretary, Dr. Peter Irving, and the Speaker, Dr. Louis H. Bauer, were automatically members of the Committee. Dr. Edward R. Cunnifie was designated by the Chairman of the Board of Trustees to represent the Board. The Speaker appointed the following members: Dr. George W. Cottis, Dr. J. Stanley Kenney, Dr. Norman S. Moore, Dr. Walter W. Mott, Dr. Leo F. Simpson, and Dr. Herman G. Weiskotten. Dr. Joseph S. Lawrence, Dr. David J. Kaliski, Dr. Laurance D. Redway, and Mr. Dwight Anderson were invited to all the meetings of the Committee and made valuable anatisation. and made valuable contributions.

The Committee met in June, 1943, and organized, with Dr. Bauer as Chairman and Dr. Irving as Recorder. The Committee met seven times in all and studied a large number of subjects. It came to a conclusion on some of them, but others need further study. study. In fact, some of the policies on which conclusions were reached and on which recommendations are made may need further modification and

development.

General Comments on Problems Involved .- The Committee feels that changes in the methods of distribution of medical care are as necessary and as inevitable as changes in diagnostic and therapeutic methods. The medical profession must take the leadership and point the way for constructive, evolutionary changes which will effect a wider distribution of medical personal allowances. tribution of medical care at a lower cost, without endangering the high standards which now exist. The Committee has come to the conclusion that there is no one answer to the problem but that there are several answers.

There have been many reports issued from time to time on the subject of medical care. There have been various estimates of the number of people in the country who have inadequate medical care or none at all. The numbers have varied largely with

what the people reporting wished to prove.
Your Planning Committee, however, started off with the premise that it wishes to see everyone in the State of the Stat the State of New York receive adequate medical care of a high quality, and that if there is a single person who does not have such care available, it is

one too many.

The wartime boom in employment has shown definitely that people prefer a personalization of service. This is indicated by the fact that charity hospitals in times of slack employment are overcrowded and the semiprivate or private beds in the private and voluntary hospitals are not filled whereas at present the reverse is true—the turnover in charity hospitals is at a new low and private and voluntary hospitals are overcrowded.

Diagnostic procedures, private nursing care, and hospitalization have all increased tremendously the costs of medical care.

There is no evidence that the people wish different doctors or a different type of medical care, but they do wish that care to be more widely available and at a lower cost.

There is always a tendency among certain groupto stress the need for medical care among the inadequately housed, clothed, and fed section of the population, using the economic situation of these people as an argument for the overthrow of the American system of medical care. The economic situation of these people is what breeds the need for medical care and all the medical care in the world would not remedy their plight. The removal of economic barriers should be an end in itself and not used as an argument for a different system of medical care. This is an evidence of the failure of government and not evidence of the failure of medical care.

There have been many suggestions for changes in our present system of medical care, and your Committee has given a great deal of thought to most of these proposals.

The one about which one hears the most at the moment, and often in the past, is compulsory sickness insurance.

Compulsory Sickness Insurance.—Compulsory sickness insurance is in operation in the majority of the countries in the world. It works better in some than in others, but nowhere has it given as high a level of medical care and of health as exists in the United States. There is a tendency to mass medicine—that is, a tendency to treat everyone alike regardless of the individual needs of the patient; there is usually little personal relationship between the doctor and the patient, the doctor being responsible to the government and not to the patient; regulations, red tape, and interference with therapeutics render it impossible to give good medical care; it encourages malingering on the part of the patient and offers little incentive to the doctor to do good work; there is a growth of bureaucracy in order to administer the service, and politics is frequently a determining factor; it is wasteful and inordinately expensive, although advertised as "free medicine. There is little encouragement of preventive medi-cine—in fact, preventable diseases increase. For example, in England, which has had compulsory sickness insurance for the employed class since 1911, the rate for diphtheria is far higher than in this country. The percentage of cases of tuberculosis admitted to hospitals in an incurable state is far in excess of the rate here. Under our American system the quality of medical care has constantly increased and there is evidence that the quality would decrease under a compulsory plan.

Wagner-Murray-Dingell Bill.—Specifically, there has been introduced into Congress a bill! nown a the

Wagner-Murray-Dingell bill, which is a proposal to extend the present Social Security Act. Besides its provisions for increasing old-age and unemployment insurance and placing these under the jurisdiction of the federal government, there is a section devoted to medical and hospitalization benefits. This bill would entitle every person currently insured and his dependents to general medical, special medical, laboratory, and hospitalization benefits as defined in Section 11 of Title IX of the Act. It is estimated that, under conditions of full employment, at least 110,000,000 people would be affected by it. Senator Murray has stated that the figure may be 115,000,000 to 125,000,000. It makes no provision for the indigent.

The Surgeon General of the U.S. Public Health Service is designated as the administrator. He, with the approval of the Social Security Board, will have complete authority.

Although every physician legally qualified by a state may, if he consents to regimentation, participate in this compulsory sickness insurance scheme, the Surgeon General may by regulation prescribe the conditions of participation. He also would be authorized to determine what compensation the participating physicians may receive and would have the final say as to the manner in which they will be compensated, whether on the basis of fees for services rendered, on a per capita basis, on a salary basis, or on any combination or modification of these He would be authorized to limit the number of insured persons a particular physician may treat. He would be authorized to determine what constitutes the services of a specialist.

There is also created a National Advisory Medical and Hospital Council of sixteen members appointed by the Surgeon General, and he is chairman of that Council. The appointments are to be made from lists of names submitted by professional and "other" organizations There is no provision making it essential that any member of this Council be a physician, and even were they all physicians, the Council is purely advisory and has absolutely no authority.

While an insured individual may select, normally, from the list of participating general practitioners the physician to treat him, he will be denied that privilege if the physician's quota of patients, as established by the Surgeon General, is already filled. If he is in need of the services of a specialist, he will have no voice in the selection of that specialist, except as expressed through the general practitioner. The Surgeon General may arbitrarily assign an insured person to a particular physician if such person does not make his own selection.

The Surgeon General would be authorized to determine what hospitals may participate in the scheme. Hospital benefits will range from \$3.00 to \$6.00 for each day of hospitalization, not in excess of thirty days, as determined by the Surgeon General with the approval of the Social Security Board. The rates will range from \$1.50 to \$4.00 for each day of hospitalization over thirty but not exceeding ninety. If the insured is placed in an institution for the care of the "chronic sick," the rate will range from \$1.50 to \$3.00 a day. Instead of making such payments to the insured individual, the Surgeon General, subject to the approval of the Social Security Board, may make contracts with participating hospitals for the payment of the reasonable cost of hospital service at rates neither less than the minimum nor more than the maximum rates specified, such payment to be full reimbursement for the cost of essential hospital

services, including the use of ward or other less expensive facilities compatible with the proper care of the patient.

It is very doubtful if the private hospitals of the country could continue to exist under such rates.

Insured persons will also be entitled to certain laboratory and other benefits, the nature and extent of which will be determined by the Surgeon General, but which will include chemical, bacteriologic, pathologic, diagnostic and therapeutic x-ray, and related laboratory services, physical therapy, special appliances prescribed by physicians, and eyeglasses prescribed by a physician or other legally qualified practitioner.

To finance the provisions of this bill, each included employer will be taxed annually at the rate of 6 per cent of his payroll, excluding all remuneration paid to an employee in excess of \$3,000 a year, and each insured employee will be taxed 6 per cent annually of the wages received up to \$3,000. Self-employed persons will be required to pay 7 per cent of the market value of their services annually up to \$3,000. States and political subdivisions and their employees will be taxed at the rate of 3.5 per cent up to \$3,000, if such governmental units voluntarily, by compacts, come within the coverage of the Social Security Act.

It is estimated that under conditions of full employment, from \$12,000,000,000 to \$15,000,000,000 a year would be raised, of which about one-fourth would be earmarked for medical care. How much would be for actual medical care and how much

for administration, no one knows. Section 12 of the bill provides grants-in-aid as a

stimulus for medical education, research, and for the prevention of disease and disability. The Surgeon General of the Public Health Service will determine who will be the recipients of such grants and the specific amounts that will be granted. He will determine, too, whether a particular project is worthy of

stimulation.

This bill, if enacted, would result in a bureaucratic control of medicine. It contains most of the evils of any compulsory sickness plan as previously item-It would undermine medical education and research. There would be little incentive to good medicine and both patient and doctor would be

regimented in medical care.

The proponents of the bill state that there will be no bureaucracy, no red tape, a minimum of reports, and no political interference. With the government controlling everything pertaining to the practice of medicine; with the tremendous expansion of ad-ministrative machinery that would take place; with the example of other government bureaus and their multiform, constantly changing regulations; with the example of the red tape and interference of the former Federal Emergency Relief Administration; with the evidence of low quality of medical care in other countries under government insurance plans; and, finally, with the tremendous sum of money involved, it is impossible to foresee anything but a deterioration of medical care and health standards in this country should the bill be enacted.

Your Committee recommends reaffirmation of the Society's previous stand on compulsory sickness insurance in general and disapproval of the Wagner-

Murray-Dingell bill.

Your Committee feels that there are other methods of increasing the distribution of medical care and of easing its costs which are evolutionary in character and will meet the needs of the public, and at the same time insure its quality as well as increase its quan-

Voluntary Medical Insurance.—The American people desire and demand a plan or plans for the prepayment of medical care costs. This demand must be met.

The Committee feels that voluntary medical insurance is one of the answers to this demand. The principle of this type of insurance has been approved by the American Medical Association and by this Society. This Society has also given approval to three of the plans operating within this state. Progress so far has been slow, but considerable valuable experience has been accumulated. Two of the reasons these plans have not madefurther prog-ress are: lack of education of the public on the benefits to be obtained, and lack of active partici-pation on the part of the profession. The time has now come, in the opinion of the Committee, for the State Society to stimulate these plans, facilitate their expansion, and exercise supervision over the whole problem. Hence, the Committee recommends the establishment of a Bureau of Medical Care Insurance by the State Medical Society, under a full-time director and with the necessary personnel. This Bureau is to have the following duties:

"Correlate the activities of the A.M.A., other

states, and other countries.
"Educate physicians of New York State by means of the JOURNAL and other publications.
"Report regularly to the Council and to the

Committee on Public Relations and Economics. "Make available material for the Publicity

"Meet with directors of present voluntary medical care plans of New York State to assist in . promotion and in study of actuarial experience.

"Meet with county societies in which no plans are operating, to the end that New York State may be wholly covered by voluntary prepayment

plans.
"Meet with Departments of Social Welfare and Insurance and other official agencies of the New

York State government.
"Prepare material for submission to the Journals

of various county societies.
"Meet with representatives of the Hospital Association of New York State and with the Hospital Insurance or Blue Cross organizations.

Study and report on commercial insurance

plans and policies.

THE WAS THE WAY OF THE WAY TO STANK THE STANK

3

ķ

"Meet with industry, labor, management, that

is sponsoring medical care programs.
"Establish a central bureau as a clearing house

for existing plans.
"Study possibilities and procedures for a statewide plan directed and controlled through the Medical Society of the State of New York.

The selection of the Director and personnel to operate this Bureau should be made by the Council The organization and operation of this Bureau will be a somewhat expensive venture, and in view of the reduced income of the Society during the war it would not be possible to establish such a Bureau with proper financial support within the dues income of the Society without cutting down on some of the other necessary activities. This is an emergency for which says activities are available; gency for which our general funds are available; and it is recommended that for the period of the war the financial support of this Bureau should come out of funds other than the general dues income, if the Trustees find it necessary.

Hospital Insurance and Medical Service.—The modern treatment of illness includes expenses for

(1) hospitalization, (2) nursing care, (3) diagnostic procedures, and (4) medical and surgical service.

For the horizontal patient, the last item is usually the smallest. The first two should be covered by prepayment plans for hospital care and the latter two by medical expense indemnity insurance. would probably be a money-saving investment for welfare authorities to carry both these types of insurance to cover those medically indigent persons for whom they are responsible.

For the ambulatory patient, medical expense indemnity insurance will adequately cover the cost of doctors' services.

Preventive medicine, as in the field of tuberculosis and venereal disease, is a true function of state and local government in supplying facilities, provided that the purely medical aspects of the problem are under the control of the physician.

In further elaboration of the preceding, the Committee concurs with the action of the American Medical Association in opposing the inclusion of medical services such as pathology, radiology, anesthesiology, and any other medical service, in a hospital insurance plan, and proposes that such services be insured for under a medical care plan. The Committee is wholly in accord with the extension of group hospital insurance as such, and believes that it should have the widest coverage possible. The Com-mittee objects to the inclusion of medical service in a group hospital plan for the same reasons which were adopted by the House of Delegates of the American Medical Association in June, 1943. It feels that these medical service features properly belong in a medical expense indemnity insurance plan. The action of the House of Delegates of the American Medical Association is quoted herewith:

That the House emphatically reiterate that it disapproves the injecting of a third party into the personal relationship of the patient and the physician, and that hospitals should not be permitted to practice medicine.

That the practice of radiology, pathology, and anesthesiology is the practice of medicine just as much as is the practice of surgery or internal medicine, and that it is only a short step from including the first three in a medical service plan to including the whole field of medicine in such a plan

That the public should be educated to realize that the hospital-created monopoly control of radiologic or any service as a source of profit beyond the normal provision for replacement, department development, and proper proportion of over-all costs of operation of the hospital should not be permitted, nor can the hospital rightfully use per diem charges against all the hospital patients to support a radiologic or other department devoted to creating bargains in radiologic or other services in order to make hospital group insurance more attractive. To permit either will result in decrease of the quality

of service and increased cost to the patient. The medical profession must watch with care all proposed plans for medical service and endeavor to prevent the acceptance of any plan which includes medical service

under the control of the hospital.

The effectiveness of this program can be attained only if constituent state medical associations and component county medical societies use their influence on hospitals in their respective localities and exercise control over the local members of the medical

profession.

The public must be educated on what it will mean to them in the way of inferior medical care if these dangerous trends are not curbed.

"G. In the relationships of the medical staff and the board of directors of a hospital there should be no intermediary. The staff should have direct access to the board."

With reference to the use of the insurance principle in the case of welfare patients, it is recommended that the Council suggest to the Welfare Department that it consider the possibility of the use of the insurance principle rather than the present

Regional Centers for Diagnostic Aid.—In discussing postwar planning, many members of organized medicine have advocated a closer relationship with governmental agencies. This, they claim, would be a desirable step forward in providing adequate medical care for all. One of the most frequently heard criticisms of the medical profession which has been repeated over many years is the statement that persons living in the rural areas are not provided with proper medical service. This, it is explained, is due to two causes-viz., the lack of a sufficient number of medical men to care for all, and the fact that proper facilities for practicing with modern medical methods are not available. As the result of the second condition, many young doctors, fresh from medical school and an extended hospital internship where every facility for making whatever clinical tests are necessary and where information from radiologic examinations is at hand, suddenly find themselves in an area devoid of any means for making the clinical laboratory tests so necessary for the modern physician to possess in order properly to treat the patient. It is not surprising that, finding himself in this situation, he becomes discouraged and moves away to some town or city where the necessary facilities are available, or, even worse, remains there and does not keep pace with medical advance, which means deterioration of the individual and rendering a medical care which does not fully protect the interest of his patient.

In looking about for some plan that would correct these conditions, that would attract more medical men and develop conditions that would encourage them to remain permanently in the area and at the same time realize a closer relation with governmental agencies, the question of a diagnostic center might be considered. Some advantages they would offer would be that with more men located in the district and with the aid of these centers a higher standard of practice would follow, to the benefit of

the immediate commonwealth. The question should be studied from all angles and provision made so that disadvantages that might occur would be prevented. A number of questions suggest themselves to us, as their answers will determine in a great degree the extent of our success in this undertaking. Where should these diagnostic centers be located? What type of center and what form should they assume completely to overcome this situation in rural counties of our state? What type should the personnel be? How should they be supervised? To what extent should they give service to the medical men? Should all patients be compelled to visit the center in order to obtain the benefits intended for them?

It is hardly necessary to mention that experience will finally answer these questions, but certain safeguards should be erected and modified as needed.

Location of Centers. - The Medical Society of the State of New York should make a survey of the needs of the different areas in the sparsely settled counties of the state. This would provide the information necessary to select intelligently the locations of greatest value. They should be selected with a view of transportation to and from the clinic and if possible, in relation to existing hospitals.

Supervision.—Supervision should be by a board, the majority of which should be members of the medical society. They should select the professional members of the personnel and should set up qualifications required for those who would fill the positions, so that efficient and worth-while work would be assured. They should determine the number necessary to do all the work and to make the rules under which the particular clinic would be operated. The staff should consist of the required professional members, such as pathologists, clinical pathologists, radiologists, and technicians. There must, of course, be a lay staff of clerks, etc, appointed by either

county or state officials.

The center should be subsidized, the least desirable subsidy being the federal grant, the more desirable, state aid, and the most acceptable being local community aid from county taxes. However, in this description we are visualizing a center supported by state aid. Those who are in a position to pay for the work should do so but all fees collected must be turned back to the state. All salaries and rent or purchase of building and all other expenses. of the center should be borne by the state. The rules under which the center would operate should take into consideration the fact that its facilities are at the disposal of the indigent poor as well as those able to pay. Provision should also be made to send technicians out to collect specimens and make radiologic examinations at the patient's home, either in an emergency or when the patient cannot safely be transported to the center. Patients with certain fractures, particularly those treated by traction, should have certain necessary films made at the patient's house. Again, to prevent unfair competition with those medical men residing in this area, private practice should not be permitted to any member of the staff. All patients should be returned to the doctor who directed them to the center.

The work of these centers should not be really for the purpose of furnishing a diagnosis but of making the clinical tests and promptly informing the physician in attendance of the result of the examination or tests. There should be no treatment provided. Blood transfusions could be arranged for by the doctor, all pathologic work, testing of donors and recipients being done at the center. Basal metabolism tests and all other clinical tests, blood examinations, and radiologic examinations should be

available to every doctor in that area.

The question now must be answered—would these centers as depicted here fully correct the condition which has brought forth many criticisms of our medical service? We believe that the establishing of the centers of this type in localities should be It would determined after a state-wide survey. attract physicians to the area and would raise the standard of medical service to the benefit of the entire community. In the creation of such a program or in the initiation of a movement to secure it, one must always remember that the easiest of all things is to write a bill for a model plan, only to be disappointed in what finally becomes a law. However, the demand for relief of this condition has been

heard over many years, and if we are to have closer relations with governmental agencies, we should lead the way. Again these centers, we believe, can be created and operated in the carefully selected areas with no damage to a free and unfettered practice of medicine. Therefore, the Committee recommends that a special committee or subcommittee be appointed by the President to make a survey of New York State to determine the need for such a program and the areas to be cared for. The suggested methods of operation are, of course, tentative, and, if the survey indicates the desirability of establishing such diagnostic centers, then the details of management would have to be worked out carefully

Industrial Medicine.—Industrial medicine with all of its possible ramifications in the future deserves and even demands immediate intensive study and cooperation by organized medicine, to the end that this relatively recent special field shall not become a problem child.

The Council on Industrial Health of the American Medical Association has done a vast amount of constructive planning in this field, and has set up carefully planned programs for committees on industrial health, not only in the various state societies, but

also one for the county society.

It may truthfully be said that if an active committee in the county medical society carried out in full the program recommended for such a society, it would result in far-reaching benefits to industry, to labor, and to organized medicine. The innumerable problems that arise involving the interests of each group would have a common meeting ground where these might be resolved by cooperation and education. Farsighted policies could be outlined that would result in satisfaction to industry and labor and a true authority to organized medicine in matters of health.

In the sixty-two counties in New York State not over forty would need such a committee. Most of them have committees appointed, but on the authority of the New York State Department of labor, the activities of the county medical societies in the field of industrial health have been quite limited up to this time. A few of the counties—Erie, New York, Queens, and one or two others have done a limited amount of exploratory work in

this field—and there the matter stands.

Your Committee feels that this is a subject that demands a much more energetic consideration in the

immediate future.

In carrying out this program, the Committee invites attention to the program of the American Medical Association for state and county societies. The recommendations for both are quoted herewith:

The medical needs of industry can only be determined through familiarity with the character of industrial processes, hazards, and health programs existing in the com-

"B. A census of the physicians specializing in, or giving attention to, industrial practice with their industrial connections and the scope of the service they provide should be

compiled.

The type of service that the private practitioner can render to the small plant through a health maintenance program needs investi-

"D. Physical examination is the most likely basis for early common interest to industry and the physician alike and needs careful study and control.'

Then under "Correlation":

"The activities of local organizations which are or should be interested in industrial health problems need coordination to avoid duplication of effort. The list should include:

- Health Departments
- 2. Industrial Hygienists
- 3. Industrial Nurses

4. Safety Councils

- Manufacturers' Associations 5.
- 6. Labor Organizations
- 7. Casualty Insurance Adjusters

Bar Associations

"An Industrial Health Program for a county

medical society

"Every medical society in a county having sufficient industrial concentration to justify it should organize a committee on industrial health. There should be representation on the committee from (1) private practice, (2) industrial practice, and (3) the local health department. These are and (3) the local health department. the essential professional groups needed to supply an adequate health service to industry in any community.

"It is desirable also that an executive officer of the county medical society should be a member of

the committee.

"The Objectives of the Committee:

"The committee should understand the components of an adequate industrial health service and be prepared to adjust them to existing local medical and public health facilities and to patterns of community medical practice.

"The essentials of an industrial health service

- 1. A competent physician who takes genuine interest in applying the principles of preventive medicine and hygiene to employed groups and who is willing to devote regular hours to such service in the working environ-
- 2. Industrial nurses with proper preparation, acting under the physician's immediate supervision or under standing orders developed by him or by the committee on industrial health of the county medical society.
- 3. Industrial hygiene service directed at improvement of working environment and control of all unhealthful exposures, to be provided by physicians and others with guid-ance and assistance from the specialized personnel in state and local bureaus of industrial hygiene.

4. A health program which should include:

(a) Prompt and dependable first aid, emergency and subsequent medical and surgical care for all industrially induced disability.

conservation of employees (b) Health through physical supervision and health

education.

 (c) Close correlation with family physicians and other community health agencies for early and proper management of nonoccupational sickness and injury.

(d) Good records of all causes of absence from work as a guide to the establish-

ment of preventive measures.

"Health education should emphasize particularly nonoccupational factors which are of importance to the health of workers—nutrition, housing, proper use of leisure time, recreation, and other related activities."

"Following preliminary organization, the activities of the county medical society's committee on industrial health will fall mainly under four major headings:

- (a) Investigation of local causes of lost time in industry as a basis for necessary remedial service.
- (b) Coordination of community industrial health facilities.
- (c) Frequent education of the public about the benefits of an industrial health program.
- (d) Continuous education of the medical profession as a means for elevating standards of industrial health service."

More specifically, we recommend that the Committee on Public Health and Education increase the time allotted to industrial medicine in its educational program. Facilities should be given physicians returning from military service, who may wish to engage in this field. There is at the present time a definite shortage of physicians trained in industrial The State Society Subcommittee on Industrial Medicine is urged to stimulate the activity of county society committees in carrying out the above program of the American Medical Association, and to form committees in areas where they are needed. The State Department of Labor has been doing a splendid piece of work in this field, and it might be increased and extended if the medical staff of the Department of Labor were increased so that members might assist county society commit-tees in coordinating their work with the definite work of the Department. It is recommended that the Council bring this matter to the attention of the proper state authorities.

The Nursing Problem.—The Committee believes that a more general understanding on the part of physicians of the problems of the nursing profession will result in mutual benefit to both the nurse and the doctor. In support of this belief it may be added that the Committee has explored the possibility of better understanding on such subjects as nursing education in general and the separation of the financial affairs of the hospital from the nursing training school in particular. Likewise, the problem of separating or distinguishing between the various levels in educational background and training of the nurse, and whether a differentiation on this basis will ease the burden of the high cost of nursing care, are subjects which have been studied and which concern the medical profession directly.

Because the destiny of the medical profession is allied with that of the hospital and that of the hospital with the nurse, it is imperative that a relationship which recognizes the interdependence of the physician, hospital, and nurse be established. It appears possible, if too great an error is made in bringing together these three services, or if the correlation does not meet with public approval, that one or all of the services may suffer by the encroachment of public control through government or insurance channels. It is apparent that the leaders of the nursing profession recognize this trend as a possibility. They are at this time concerned also because there is a trend in nursing away from the professional toward the vocational status.

Members of the New York State Nursing Council for War Service have expressed a desire to have a planning group within the nursing profession which might work with a medical committee in studying the changing order.

It is, therefore, the opinion of the Planning Committee that a continuation of the study of the changing trend in nursing in relation to medicine be authorized, and that during the coming year, now that the contacts have been made, a closer and more active exploration of the field be made by joint meetings with a committee representing the nursing profession and, if possible, one representing hospital administration.

Medical Education.—The Committee recognizes that the future health and medical care of the American public depend primarily upon the nature and quality of programs of medical education maintained for the training and preparation of the physicians who must assume responsibilities in this field.

As war measures, certain fundamental changes have been virtually forced upon medical education. Army and Navy training programs in general have been planned to provide training for the largest possible number of men in the shortest possible time. Although the medical education program itself has country, military objectives have tended to domibeen left in the hands of the medical schools of the nate the adaptation of medical education to war needs. Although the necessity of such domination may be recognized as an essential war measure, it is important that we do not close our eyes to the possible effects of these wartime changes upon the whole field of medicine. The medical colleges of the country were asked to increase the size of their entering classes by 10 per cent. They were asked to adopt accelerated programs which, by the elimina-tion of long vacation periods, would permit students to complete the four-year medical course in three calendar years. They were asked to adopt minimum entrance requirements of two years of premedical college work and later to accept premedical courses of sixty and eighty weeks' duration established by the Army and Navy, respectively. Army and Navy programs provide for the assignment of students to the medical schools of the country rather than for selection by the individual medical schools.

Finally, internships have been limited to a ninemonths period and only a small percentage of graduates are permitted to secure graduate experience

beyond the internship.

It is apparent that the present wartime program not only handicaps a student during his medical course and subsequent hospital training, but brings him into the medical school more immature and less well prepared for the study of medicine than were more than 95 per cent of the students under the normal peacetime program.

Although it is recognized that the potentialities of the individual will probably ultimately determine his future development, the Committee believes that it should be recognized that the present program is not conducive to a sound development for the practice of medicine. The Committee believes it is of the utmost importance that careful attention be given to the re-establishment of satisfactory standards of educational programs just as soon as the war needs will permit. This does not mean that the medical schools should blindly follow their prewar programs. On the other hand, the present upset in medical educational programs offers opportunity for careful evaluation and postwar planning by the individual schools.

Finally, the Committee deplores the apparently increasing tendency of the various states not only

to permit unqualified practitioners of the healing arts to treat the public but to grant them full licenture for the practice of medicine and surgery.

It is recommended that this section of the report be referred to the Committee on Public Health and

Education.

A more detailed report on Medical Education is attached as an appendix to this report.

Other Matters.—The Committee considered the question of Workmen's Compensation, which has a part in any planning program. However, since a separate committee of the Council has presented a detailed report on the subject of Workmen's Compensation, the Planning Committee is making no other specific recommendations. The Committee also gave some thought to the question of a Basic Science Law, and, again, as this subject is in the hands of a special subcommittee, the Planning Committee offers no comment.

Continuance of Committee.—The Committee feels that its work is not completed, and that its continuance should be authorized for another year. It therefore urges the House to authorize the reappointment of the Committee on the same basis as last year, namely, that it consist of the President, President-Elect, the Secretary, the Speaker, the Chairman of the Board of Trustees or a member of the Board designated by him, and six members to be appointed by the Speaker, the Committee to elect its own Chairman and Recorder.

Respectfully submitted,

McGoldrick, M.D., Brooklyn Norman S. Moore, M.D., Ithaca Walter W. Mott, M.D., White Plains Leo F. Simpson, M.D., Rochester Herman G. Weiskotten, M.D., Syracuse Peter Irving, M.D., Recorder, New York March 27, 1944

#### Appendix on Medical Education

(This Appendix was prepared by Dr. Herman G. Weiskollen, who was designated by the Committee to make a survey and report on medical education.)

In connection with a consideration of wartime and postwar medical education, it is probably best to consider first its prewar status and the effects of the war upon it. It should be emphasized that medical education in the United States was in a very healthy

state just before the war.

Beginning with the survey of medical schools of the country in 1909 and 1910, which was initiated by the Council on Medical Education of the American Medical Association and at their request sponsored by the Carnegie Foundation, there has been a progressive improvement in medical education throughout the country. The number of medical schools has been reduced from approximately one hundred sixty to seventy-seven. The surviving schools have effected many changes in the whole field of medical education, involving premedical college education, the medical course itself, and also postgraduate and graduate education.

In 1940 there were sixty-six four-year medical schools in the property of the country of the surviving premedical schools.

In 1940 there were sixty-six four-year medical schools in the United States, the number having remained unchanged since 1933. Of these sixty-six

four-year medical schools, twenty-three were state-There were supported and three city-supported. also ten two-year medical schools or schools of basic medical sciences, offering the first two years of the medical course. All but two of these schools (Dartmouth and Wake Forest) were state-supported. Two of these schools of basic medical sciences were developing into four-year medical schools. The Bowman-Grey (Wake Forest) Medical School has completed this development and the University of Utah School of Medicine will have the full four-year course established by January, 1944. In addition, there was one medical school which offered only the last two years of the medical course. This school (Rush Medical College) has now discontinued its existence and is merged with the University of Illinois School of Medicine. The Alabama State Legislature has approved appropriations for the development of the University of Alabama School of Medicine (a two-year medical school) into a full four-year school. At least one other of the two-year schools has looked forward to the development of a full four-year course. Difficulties in the field of medical education have been such that it has become increasingly difficult for the two-year medical schools to maintain an independent existence. Recognizing this, the University of West Virginia School of Medicine (a two-year medical school) has effected an affiliation with the Medical College of Virginia. At least three of the remaining two-year medical schools do not at the present time appear to offer a sufficiently promising future to warrant their continued existence.

In addition to the approved medical schools, there have been in existence during the past few years five unapproved medical schools. It would appear that only one of these has up to the present time offered any promise whatever, as far as the successful continuation of the medical school is concerned. One or two of the schools have served virtually as "diploma mills" and have granted many M.D. degrees to osteopaths. Although there are only two states whose licensing boards recognize any of these unapproved medical schools, attendance at these schools has been greatly stimulated, especially during the period of the war, not only by the excessive number of applicants to the approved medical schools, but by the fact that students in unapproved medical schools have been eligible for deferment by the draft boards. If present legislation in the State of Massachusetts remains unaltered and becomes effective and other states retain their present status of licensure, it is to be expected that all but one of the unapproved medical schools of the country will be forced out of existence. The State of Illinois licensing board will probably continue to accept the graduates of Chicago Medical School (an unapproved school located in Chicago).

Requirements for Admission.—During the recent years there has been a gradual but progressive increase in requirements for admission to medical schools of the country. These requirements have increased from high-school graduation in many of the schools of the country in 1905 to 1910, to a required minimum of two years of college work including specified courses in physics, biology, and chemistry, including organic chemistry. The Council on Medical Education and Hospitals of the American Medical Association and the Association of American Medical Colleges have retained such a minimum two-year requirement. However, the number of individual schools accepting students with such minimum requirements decreased from

thirty-two in 1936 to eleven in 1940, and was further decreased to eight in 1941. In the latter year only 1.2 per cent of the medical students were admitted to the approved medical schools of the country on the basis of less than three years of approved college work. In 1940 four of the medical schools of the country required a Bachelor's degree for admission; one required four full years of college work, and four schools required three years of college work and a Bachelor's degree at the end of their freshman year. It would thus appear that regardless of the stated minimum requirement of two years of premedical college work, practically all of the medical schools of the country have been operating on the basis of standards higher than this. It is interesting to note that in 1940, 67.4 per cent of the graduates of the medical schools of the country had a Bachelor's de-

Although standards for admission to medical schools of the country have been thus increasing, the requirements for admission have become less specific. Most medical educators are definitely opposed to rigid premedical college courses which offer little opportunity for individual development. It is probably worth while to examine in some detail the basis for these increasing requirements for admission to the medical schools of the country which have been self-imposed by the individual medical schools and the individual students in spite of the fact that the minimum requirements as stated by the Council on Medical Education and the Association of American Medical Colleges have remained at the two-year There are many factors which premedical level. have affected the extension of premedical education. Life in general, as well as the practice of medicine, has tended to become more complicated; and recognition of the importance of a broad background of education in preparation for the practice of a profession has become rather general. There is probably no professional career which carries heavier responsibilities and requires more mature judgment than does the practice of medicine. Thus from the standpoint of maturity of the individual, many have advocated an extension of the period of preparation for a career in medicine. Advances in medicine have emphasized the importance of a thorough grounding in chemistry and many of the medical schools have seen fit to require qualitative and quantitative analysis and physical chemistry in addition to general and organic chemistry. It is practically impossible to meet these latter requirements in two years of college training. Furthermore, there has developed a general recognition that the field of medicine is so broad that it not only offers unusual opportunities to men with a great variety of interest and special training, but requires a large group of individuals with varied backgrounds if medicine is to continue its development. Most advances in medicine have resulted from the activities of individuals with special interests and special training in some one of a variety of special fields. Rigid premedical college courses of two years' duration offer little opportunity for a student to develop such special interests or to acquire advanced training in the fields of these interests. The medical course itself has been vastly improved and the students with special interests are frequently offered stimulus as well as the opportunity to carry these interests into the field of medi-

Didactic classroom teaching has been largely done away with and medical education has been developing into a very high grade of professional education as contrasted with the "secondary school" type of program all too frequently previously followed.

Interested students have been offered opportunities for elective work during summer vacations as well as during the academic year. Students themselves have assumed an attitude of desiring not merely to acquire the right to practice medicine by securing an M.D. degree from an approved medical school and a license to practice medicine. This is evidenced by the fact that although required by only twelve medical schools and twenty-two licensing boards, practically all medical graduates of recent years have served internships of from one to three years. The eighteen months' to two years' internships have become more popular with graduates, and these were frequently followed by assistant residencies or residencies lasting from two to five years.

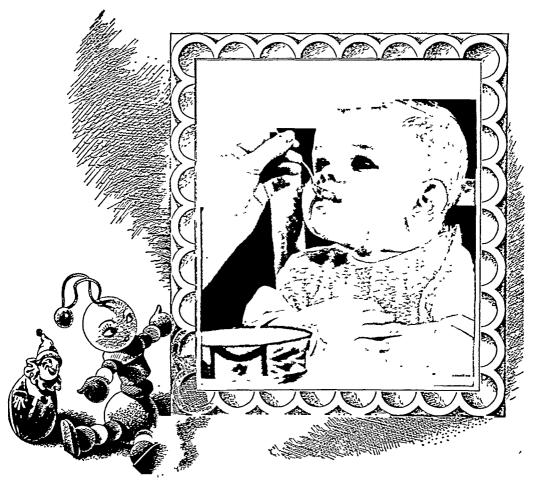

Wartime Changes in Medical Education.—As war measures, certain fundamental changes have been virtually forced upon medical education. Army and Navy training programsingeneral have been planned to provide training for the largest possible number of men in the shortest possible time. Although medical education has been left in the hands of the medical schools of the country, the military objectives have tended to dominate the adaptation of medical education to war needs. Although the necessity of such domination may be recognized as an essential war measure, it is important that we do not close our eyes to effects of wartime changes upon

the whole field of medicine. The colleges of the country were asked to increase the size of their entering classes by 10 per cent. They were asked to adopt accelerated programs which by the elimination of long vacation periods would permit students to complete the four-year medical course in three calendar years. They were asked to adopt minimum entrance requirements of sixty semester hours and later to accept premedical courses of sixty and eighty weeks' duration established, respectively, by the Army and Navy. Finally, internships were limited to a twelve months' period, beginning with the date of graduation, and it is now proposed to limit them to nine months.

To gain some idea of the effect of the sum total of these changes in medical education, it is necessary to consider the effect of each change. At the time of the survey of medical education conducted between 1934 and 1937, it was found that many of the medical colleges of the country had an unwarrantedly large number of students for whose training adequate clinical facilities were not available. It was suggested that these colleges reduce the size of their classes in order that satisfactory standards might be maintained. Essential as it may be to the war effort, a 10 per cent increase in the size of the entering classes cannot fail to result in a lowering of the standards, especially with the great depletion of the faculties of the colleges resulting from the war.

The effect of the accelerated program on medical education is difficult to estimate. Whether a student can develop as satisfactorily under a continuous intensive three-year program as he would under a more leisurely four-year program is open to serious doubt. Although the long summer vacation provided an opportunity for needy students to earn money, it undoubtedly served other and probably more important purposes. It gave students an op-portunity for unhurried deliberation and orientation. It provided an opportunity to follow up for a period certain special interests. A considerable percentage of the better students who were able to do so spent these vacation periods in pathologic or bacteriologic laboratories, in tuberculosis or general hospitals, and frequently developed interests which determined

# Just like his Grandpa-

—a hearty scooper-upper of Cream Farina

THE first year in the life of Heckers' Cream Farina saw the United States declare war. But it was no war you remember. It was the Mexican War of 1846.

Even then, the doctors and the observant scientific men of that day gave widespread approval to it. They were quick to see how easily digested it was, how nourishing, how quickly it was assimilated.

Today, Heckers' Cream Farina goes marching right on into the homes and hearts of families everywhere. And it is even better for

the modern baby than it was for Grandpa. Because it is now scientifically enriched with Vitamin  $B_1$ , niacin and nutritional iron.

#### Next on child's menu—H-O OATS

As the family grows up, H-O Oats take the spotlight for a stick-to-the-ribs breakfast. Oats are richer in

body-building protein than any other grain. And the special pan-toasted flavor of H-O Oats makes it a favorite with the growing-uppers.

or greatly influenced their future careers. It gave faculty members opportunity for reviewing and replanning courses, as well as an opportunity to devote some leisure time to special interests and uninterrupted research carried on either in their own departments or at special laboratories such as those maintained at Woods Hole or Bar Harbor where they worked in close association with outstanding men working in their own and allied fields.

There have been many advocates of intensifying and shortening the medical course. It is interesting that these advocates have not been from the ranks of the intelligent medical profession nor from the student body, who have tended to voluntarily lengthen their medical training far beyond any offi-

cial requirements.

The forced adoption of minimum entrance requirements have denied a student the right to take more than the minimum premedical course before entrance to the medical school. Under the wartime program no student has an opportunity to do major work in any subject, or even to develop any special interests during his college course. With a minimum of college work he enters medical school as an immature boy between 18 and 19 years of age, ill prepared to assume the responsibilities of a medical student.

Thus the wartime program not only handicaps a student during his medical course, but also brings him' into the medical school more immature and less well prepared than were 95 per cent of our students

under the normal peacetime program.

During peacetime inadequacies in fundamental training might be, at least in part, compensated for by prolonged internships and residencies. However. under the present wartime program, medical school graduates are allowed but twelve months (and it is now proposed to allow but nine months) in which to complete their intern training. It is true that a very limited number are permitted an additional nine months or even two nine-month periods if they happen to be in essential positions. In other words, the medical school graduate is only by chance free to determine the nature or extent of his graduate training.

Under the present program the potentialities of the individual will probably ultimately determine his future development. However, I believe that it should be recognized that the program itself is not conducive to a sound development of the practice of medicine.

It would appear to be of the utmost importance that careful attention be given to the re-establishment of satisfactory educational programs, just as

soon as the war needs will permit.

The restoration of satisfactory standards for admission to the medical schools of the country during the postwar period may be rather readily effected if the keen competition for admission to medical schools continues and premedical student advisers use sound judgment.

There is also little question but what medical school graduates will of their own volition seek opportunities for satisfactory internships and residencies to prepare them adequately for practice.

However, it is not clear what the attitude of medical educators and medical schools will be toward possible continuance of the accelerated program in connection with which the medical course itself is completed in three calendar years. The fact that under the accelerated program the income from tuition and fees has been increased by 331/2 per cent may prove to be a definite handicap to certain schools who would otherwise wish to return to the normal four-year program. There has been a tendency on the part of many schools which have been largely dependent for their budgets upon income from tuition to increase their budgets as their incomes from tuition have increased. These schools may find it very difficult to adjust their finances to a restoration of the normal four-year curriculum Decisions in regard to this matter may greatly influence the number of medical school graduates during the postwar period.

If the accelerated program were to be continued during the next ten years, the medical schools of the country would graduate between 70,000 and 80,000 physicians as compared with approximately 50,000 graduated during the past ten years. During recent years the number of physicians graduated by the medical schools has been greatly in excess of the

number of physicians who have died.

Undoubtedly, careful consideration should be given to the probable needs of the country for physicians during the postwar period and this subject should have separate and careful consideration. April 3, 1944

#### Supplementary Report of the Board of Trustees

To the House of Delegates; Gentlemen:

At the meeting of the House of Delegates in May, 1943, a resolution was adopted that the position of the Director of the Bureau of Workmen's Compensation of the State Medical Society be made a fulltime one at a suggested annual salary of fifteen thousand dollars (\$15,000) and for a term of five The Director was to give up the private practice of his profession. Implicit in the whole resolution was that the present incumbent, Dr. Kaliski, was to be continued in office. It may be stated at the outset that at that time there was practical unanimity as to the desirability of having Kaliski do this work.

When the matter was submitted to the Board of Trustees, it was apparent at once that if they approved a contract which literally embodied the terms of the resolution, the Society would be committed to the largest financial obligation ever entered into with an individual employed by it during its entire history, and it was likewise apparent that this com-

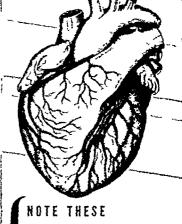

mitment would be undertaken in a time of greatly depleted income due to war conditions. gravity of the undertaking led the Trustees into a very full discussion of the entire situation. Part of the discussion was directed to a precise determination of the duties of the Director of Workmen's Compensation. A further subject was the desirability and possibility of having part of the compensation paid by the State Society and part by one or more component county societies. The length of the contract was also given serious thought. Many regular and special meetings were held through a period of months in an effort to clarify the situation. At one time a contract for a limited period of time, shorter than that suggested in the resolution, and for a lesser consideration, was offered to Dr. Kaliski and he rejected it. He proposed an alternative contract which, it should be stated, would have provided for an appreciably lesser amount of compensation and a shorter period of time than suggested in the origi-

nal resolution. Dr. Kaliski himself and others on his behalf conferred at various times with the Board of Trustees. There came a time when it appeared that there was a strong probability that a meeting of the minds could be brought about between Dr. Kaliski and the Board of Trustees, and that a contract could be agreed upon.

In the fall of 1943 excerpts from the testimony of the Moreland Commission investigating the administration of the Workmen's Compensation Law appeared in the newspapers. Premonitions of the full extent of the scandals disclosed by the Commission were coming to light. At the turn of the year the Board of Trustees read in the daily press that Dr. Kaliski had himself been called as a witness and that he gave lengthy testimony before the Commission. He was being closely questioned concerning his duties and concerning the action of the various county medical societies with relation to disciplinary

proceedings then pending. At the February meeting excerpts of the testimony of Dr. Kaliski were read by the Board of Trustees. It was decided at that time that no contract would be offered to Dr. Kaliski pending the final report of the Moreland Commission. When this report was made to the Governor it became apparent: first, that inaction on the part of the State and county medical societies had been severely criticized; secondly, that Dr. Kaliski's participation in this connection had been criticized; third, that the Commission was proposing specific legislation that would wipe out most of the existing powers and duties enjoyed by the county medical societies with relation to the administration of Workmen's Compensation—specifically, the power to authorize specialists in various categories and the power to discipline physicians for violations of the Law. It is not necessary for the Board of Trustees in this report to allude to details of either the testimony taken by the Moreland Commission or its findings. There is appended to this report as "Appendix A" certain testimony given by Dr. Kaliski on January 24, 1944, as recorded in the fifty-five pages of the official record and as "Appendix B" the printed report of the

Commission. Attention is called to pages 8, 26, 27, 30, and 31 of the report of the Commission. The official record of Dr. Kaliski's testimony at the Moreland Commission hearing on January 24, 1944, is too lengthy to be included in this report. It will be available at the meeting of the House of Delegates. The Moreland Commission report will also be available.

Present at all sessions of the Board of Trustees at which the matter of a contract with a full-time Director was under consideration was the President of your Society. It is important to note that on January 13 the Council met just prior to the Board of Trustees. At this meeting the President stated that the entire matter of the Kaliski contract was still under consideration. He then announced that the introducer of the resolution would address the Council. After that he announced that the Chairman of the Board of Trustees would address the Council. After these addresses he asked if anyone present had any comment and there was no comment. It is the opinion of the Board of Trustees that the resolution of the House of Delegates was passed at a time when the position held by Dr. Kaliski seemed to call for a full-time Director. However, it is now the opinion of the Board of Trustees that it is seriously to be questioned whether following the adoption of the amendments to the Workmen's Compensation Law, which have grown out of the Moreland Commission's report, the need for such full-time position exists at the present time. Certainly it is a matter which needs much further study.

Respectfully submitted,

#### Supplementary Report of the Council-Part VIII: Legislation

To the House of Delegates; Gentlemen:

The Workmen's Compensation bills, introduced by the Committee on Rules, and rushed through both Houses of the Legislature, originate decided changes in the law. For the greater part, they will be approved by the Governor. We are especially concerned with Senate Int. 1667, Int. 1678, and

The radiologists will receive the recognition for which they have been wishing. Our own radiology bill did not reach first base. After June 1, 1944, all fees for x-ray examination, diagnosis, or treatment from patients at the hospital will be turned over to the radiologists, the hospital being allowed to retain not more than 33 per cent of any fee as a legitimate charge for the furnishing of facilities. Bendiner and Schlesinger and such laboratories will be put out of business.

Fee splitting, rebating, or any other form of gratuity or kickback will be penalized as a misdemeanor. Our fee-splitting bill to cover all branches of medicine was sidestepped. The lawyers were decidedly opposed to it. But in Workmen's Compensation it was passed. It is also in the law recently enacted for New York City. The scape-

graces and scalawags of the medical profession will be dealt with. In the future, investigators and attorneys will be furnished. There will be no question of the validity of the subpoena or the taking of an oath. Both those who acknowledge their unchical conduct and the group of whom we are suspicious will be properly dealt with. The law will have real teeth, denied to the doctors, without which proper investigation or enforcement cannot take place, and for the want of which and despite the want of which the medical profession of New York City was excoriated by the Moreland Commissioners and the newspapers.

Are we having a return to Rugged Individualism or is it another invitation to politics? Recently there was discussion about the school reorganization bill—concentration of power in the hands of one man instead of a Board of nine superintendents. Streamlined! Suppose a weak or politically minded superintendent of schools and a delivery into the

hands of the politicians!

Consider the powers of the Industrial Commissioner. The single Medical Practice Committee or the Medical Society or Board or the Medical Ap-

peals Unit of the Industrial Council shall be only advisory to the Industrial Commissioner, no longer binding nor conclusive upon him. All medical matters are best handled by the medical profession, who best understand the problems involved. In place of a county medical society in each of the big four-Bronx, New York, Kings, and Queens-such organizations, including the best and wisest minds, the most ethical and conscientious men, we will have one rugged (?) individual. Mr. Corsi has a good reputation. But perhaps later, it may be possible for politicians to seize control. We all remember the terrible mess, shameful and odorous, that existed previous to July 1, 1935, at which time through the advice and influence of some wise doctors many material changes were made in Workmen's Compensation and the responsibility was rightly given to the county medical societies. An incomplete statement of true facts, or an improper interpretation, or an unwillingness to give full credit, was responsible for the maligning of the big four by Bleakly and Stichman, quoting from the report that the doctors "had tolerated the notorious kickback racket and were not yet prepared to meet the responsibility of cleaning their own house. When the new law goes into effect as of June 1, 1944, the magnitude of the job to re-rate over 14,000 physicians will be appreciated, if not before, and a sort of blanket acceptance of the very excellent piece of work already done will take place. A county medical society can so much better than anyone else estimate the qualifications of a physician. In some instances, holders of certificates of the special boards have not been so highly esteemed by the Compensation Board. The little cause for complaint on ratings has originated from the doctor, who felt that he was underrated. If the rating job be accepted and if the county medical society be requested to continue the work of rating physiciansprobably with some remuneration—and the medical society accepts this work as its duty and responsibility, the present odium attached to the medical profession will be shown to be unjustifiable. public will recognize that we have been inpugned and wrongfully condemned.

The arbitration meetings will probably be resumed. If not, they should be. They have been equitably, expeditiously, and successfully carried on. The change in the law will not bring about improvement. Rating and arbitration are supposedly going to be part of the jobs of the Medical Practice Committee of three. Under the rules and procedure of the Medical Appeals Unit of the Industrial Council of the Department of Labor, this same single committee of three for the big four will investigate, hear, and make findings with respect to all charges as to professional and other misconduct of an authorized physician, but they will be aided by the law. Investigators and attorneys will be assigned to assist. There will be no refutation on the part of the Attorney General that the law has no teeth; and no compulsory waiting from July 1, 1935, to May, 1943, for a declaration of an interpretation of the Civil Practice Act, that it is inherent in the Law that the Compensation Boards of the medical societies actually have the power to issue subpoenas and take oaths. This will also prove to be a stupendous piece of work. In these four counties of over one million population each, there are proportionately more miscreants of the fee-splitting and rebating type, and they gang up on the more self-respecting and ethical physicians. In the fifty-eight smaller counties the unworthy disciples

of Aesculapius cannot live and have the support and respect of their fellow practitioners. Concealment is impossible and loneliness would be terrible. Thus we see that improvements will result from the compensation program and that the shocking scandal of the chiselers among the doctors was not deserved and that early changes in the law will necessarily be made to restore powers and responsibilities to the big four county medical societies with the added strength of full legal support.

The chiropractic bill could not this year be rushed through by sympathizers on a "short roll call." During the slow roll call, by which each legislator is recorded as voting for or against a bill or as absent from the Chamber, it was discovered that the chiropractors would lose out and that there was no longer a quorum present and so by a special ruling the roll call was stopped and the Chiropractic bill

recommitted.

We request of the House of Delegates permission that when the Brees Bill is introduced next year to amend it very early, the amendment to be made as we were instructed by the County Societies' Legislative Chairmen in conference in Albany on February 24.

It is refreshing to state that this year the chiropractors made no charges against physicians or the

medical societies.

It is regrettable, however, that some legislators could stand up on the floor and say that they had been approached by the chiropractors to support their bill, but had not been requested by a physician or other person to oppose the bill.

The political boss and the legislator both should

be kept advised.

Experience teaches that a legislative committee of veterans, young or old, can make home runs soon after the Legislature convenes. Hence all legislative committees should be appointed by December 1 and then they will not be in the process of organization on February 1 and therefore lose a lot of time and valuable results.

We have been hearing about the Albany investigation under Mr. Hiram Todd. All registered lobbyists are included in this investigation. Dr. Joseph Lawrence has no "slush funds." He has a keen sense of right and wrong and is guided by

reason and his conscience The "Hearing Officer" did not materialize this year. Our Grievance Committee bill was recommitted and defeated. Neither the Department of Education nor the Grievance Committee requires a "Hearing Officer." The Department of Education, if it wills, can provide lawfully the legal advice that the Grievance Committee so sorely needs. These ten men, without recompense, give freely of their time and strength and they should be rewarded.

The enactment of welfare bills advances inevitably State Medicine.

Those of you who read this report probably also read the bulletins and are acquainted with actions on bills to date.

The Governor, as you see by Bulletin No. 8 issued on March 23, has the usual thirty days to approve or veto bills passed by the two Houses of the Legislature. Within a short period of time you will receive a final summary of all actions on all bills.

The Legislature adjourned on Sunday, March 19, at 5:24 AM.

> WALTER MOTT, M.D. LEO SIMPSON, M.D. JOHN L. BAUER, M.D. Chairman

April 1, 1944

Mandelamine (methenamine mandelate), as a result of its chemical structure, promotes an intensified bactericidal action.

Mandelamine evidences effectiveness against a wide range of organisms common in urinary tract infection.

Mandelamine therapy, because of the comparatively small effective dosage, rarely produces the toxic reactions frequently observed with other urinary antiseptics.

Mandelamine administration usually does not require accessory acidification, routine pH control, or fluid or dietary restrictions.

#### Medical Aspects of the New York State Workmen's Compensation Law

Report of the Committee on Public Health Relations of the New York Academy of Medicine

Review of the Academy's Past Interest in This Subject

Workmen's Compensation is no new interest on the part of the Committee on Public Health Relations. In 1921, at the request of the New York State Industrial Commission, the Committee made a review of the then existing situation and in the report of this study, published in the Medical Record of October 29, 1921, stated that "The New York Workman's Commencation Act though liberal in the Workmen's Compensation Act, though liberal in its provisions, is yet defective in several regards, particularly in its medical aspects. . . . Supervision of the medical and surgical care given is almost entirely nonexistent, even in cases insured with the State Fund.

"Organizations of a purely commercial character for the treatment of industrial injuries have been allowed to develop without supervision as to the character and adequacy of the services rendered.

"Many of the neuroses resulting from accidents have not been given the treatment necessary to restore the sufferers rapidly to productive usefulness.

"The matter of functional re-education and occupational therapy in connection with the treatment of injured workers has not received the attention which the modern development of this work de-The procedure for obtaining the necessary medical testimony from practitioners or hospital authorities needs to be improved and simpli-

"The full-time requirement for service in the medical positions of the Labor Department and the low compensation paid do not make the positions attractive to the highest grade of physicians, which the nature of this work demands."

The conditions as described were slow to improve. In 1931 the then Governor, Franklin D. Roosevelt, appointed a committee with Mr. Howard S. Cullman as chairman to review the medical and hospital problems associated with Workmen's Compensation. In February, 1932, the Committee made its preliminary report, which was published by the Hospital Information and Service Bureau of the United Hospital Fund of New York. Three of the seven medical members of that Committee were active members of the Committee on Public Health Relations of the Academy. These seven members constituted a medical subcommittee of the Governor's Committee charged with the study of the medical aspects of the problem. Dr. Adrian V. S. Lambert, a member of the Executive Committee of the Committee on Public Health Relations, was chairman of the subcommittee. On December 15, 1932, this subcommittee presented its report to Governor Roosevelt at a personal hearing. He was deeply impressed and a week later he wrote as follows: "I am referring the full report of my committee dealing with medical abuses to you for such recommendations and suggestions as you, from a professional standpoint, may deem wise and proper."

The Committee on Public Health Relations

recommended to the Council of the Academy that a further study be made, as requested by the Governor, and that it should be made in cooperation with the State Medical Society in order to insure una-

nimity of medical support for any legislative or other measures that might be proposed. Acting favorably upon this suggestion, the new Governor, Herbert H. Lehman, wrote to the President of the Academy under the date of February 2, 1933, that "in accordance with the suggestion contained in your letter of January 30, 1933, I have decided to appoint a committee of ten doctors, five representatives of the Academy and five representatives of the Medical Society." Drs. Eugene H. Pool and George Baehr, both representing the Academy, were made, respectively, chairman and secretary of were made, respectively, chairman and secretary of the new joint medical committee of ten. The report of that Committee was submitted to the Governor with the approval of the Council of the Academy in January, 1934. In his letter of February 13, 1934, to the Executive Secretary of the Committee on Public Health Relations of the Academy, Governor Lehman stated that he had directed the Commissioner of Labor Mr. Elmer F. rected the Commissioner of Labor, Mr. Elmer F. Andrews, to cooperate with Drs. Pool and Baehr in the drafting of suitable legislation to amend the Workmen's Compensation Act in accordance with the recommendations of this report. This was done, and the bill (O'Brien-Kantowski) which was introduced into the Legislature in March, 1934, providing, among other things, for the free choice of physicians, had the approval and support of the Academy of Medicine. It was passed in 1935. This constitutes the law which has been in operation since that time.

While this amended law proved to be a great improvement over its predecessor, many faults both in its provisions and its administration developed. Taking cognizance of this, the Committee on Public Health Relations appointed in 1940 a special subcommittee to look into the matter, especially the question of medical testimony offered to the referees and the disposition of cases with conflicting testi-After a review of the situation the Committee recommended to the then Industrial Commissioner, Miss Frieda Miller, the appointment of impartial boards of experts similar to the Silicosis Board provided for in the existing law. In her annual budgets the Commissioner made requests for boards of this character, but the budgetary authorities refused to great the requisite funds. authorities refused to grant the requisite funds.

supported Committee "blanket" coverage of occupational diseases which in 1935 became a part of the law, and repeatedly urged improvements in the layout and equipment of the Medical Division of the Labor Department. As in the case of boards of experts, the requests of the Commissioner for improvements in the Medical Division were refused by the budget authorities. Apparently, the development of unemployment insurance, old-age pensions, and other phases of the so-called Social Security program has relegated Workmen's Compensation to a minor place in the public interest in spite of the fact that it is of such public interest, in spite of the fact that it is of such vital importance to hundreds of thousands of individuals and to the national productive effort.

Only the recent violent and open criticism that has centered about the unethical practices which

[Continued on page 928]

THE "RAMSES"\* Diaphragm Introducer, designed after consultation with gynecologists, engages the rim of the "RAMSES" Flexible Cushioned Diaphragm at two points, shaping it into an elongated oval, thus enabling it to pass readily into the vagina. By providing complete control over the direction of travel, the "RAMSES" Diaphragm Introducer assures proper and accurate placement of the diaphragm.

1. The wide, blunt tip of the "RAMSES" Diaphragm Introducer is designed to prevent then the remote chance of accidental penetration of the uterus during insertion of the diaphragm.

- 2. Made of easily cleansed plastic, the "RAMSES" Diaphragm Introducer has no minute crevices to harbour bacterial growth—no sharp projections to cause possible vaginal injury.
- 3. The broad, rounded hooked end of the "RAMSES" Diaphragm Introducer—used for diaphragm removal—guards against possible entry into the urethra.

Your patients obtain the "RAMSES" Diaphragm Introducer when you specify the "RAMSES" Physicians Prescriptions Packet No. 501.

Established 1883 423 West 55 St. New York 19, N. Y.

[Continued from page 926]

have grown up, particularly rebates, kickbacks, padded bills, unnecessarily prolonged treatment, and the like, has been able to arouse public opinion.

#### The Present Study: Its Origin and General Purpose

On behalf of the Governor and of the Commission for Investigation of Workmen's Compensation Law Administration (the Moreland Act Commission), Mr. Herman T. Stichman requested the Academy's advice with regard to the inadequacies of the present administrative system. The Academy, shocked by the disclosures of the investigation and deeply interested, both on its own behalf and on that of the good name of the medical profession, accepted the invitation to study the situation through a subcommittee of the Committee on Public Health Rela-The object of this study was not only to suggest methods for the control of unethical practices but also, and perhaps even more important, to propose such changes in the law or in procedure as would make medical care for the injured workmen as effective as medicine and surgery can provide to the end of returning such workmen to normal productive capacity as quickly and completely as possible.

Without condoning in the slightest way any of the unethical practices revealed by the Moreland Act Commission and which the New York Academy of Medicine always has emphatically condemned, it is only fair to state that in the judgment of the Committee the very severe censure of the county medical societies is not fully justified, because of certain inadequacies in the present law which hamper investigation of the alleged irregularities on the part of individual practitioners and also because of the lack of staff and established method of procedure by which complaints or charges of such irregularities and the complaints of charges of such irregularities and the complaints of charges of such irregularities and the complaints of th

larities can be brought before them.

Our inquiries have brought forth instances in which, in spite of faithful purpose and readiness to act, the compensation committees of the county medical societies have been frustrated in their desire to improve the situation in regard to these practices because of the previously mentioned handicaps.

because of the previously mentioned handicaps. It is for this reason that we advocate the retention of the function of holding hearings and making recommendations for punishment in the hands of the county medical societies, provided definite changes in the method of the investigation and initiation of charges of unethical practices are made. Should our recommendations be enacted into law and competently administered, we believe that the county societies will not fail in their responsibility.

We are fully aware of the fact that the widespread system of fee-splitting and accepting rebates is by no means confined to medical practice under Workmen's Compensation, or indeed solely to the medical profession, as this reprehensible practice has become all too common in many fields of endeavor. We have, therefore, made recommendations that would have a wider application than to Workmen's Com-

pensation alone.

Human nature being what it is, if access to or claims upon large public or quasi-public funds are unsupervised, some form of graft is pretty certain to develop. Eagerness to share in the \$18,000,000 now being expended every year in New York State for medical fees under Workmen's Compensation is a case in point. When we contemplate the possibilities contained in the projected plans for extended social security funds, it is not difficult to foresee

similar problems arising on a much larger scale and consequently it is possible to anticipate that a plan of regular supervision of medical services and control of the resulting medical expenses such as advocated in this report may lend itself to wider application than to Workmen's Compensation alone.

In dealing with fee-splitting, the Committee recommends an amendment to the Education Law which would make this offense punishable by revocation of license and applicable not only to Workmen's Compensation but to all medical practice. The Committee also recommends an amendment to the Penal Law whereby fee-splitting would

become a misdemeanor.

The recommendations of this report have been developed in the course of conferences with representatives of the State Department of Labor, of the State and county medical societies, of the insurance carriers, of organized labor, and the Counsel for the Commission for Investigation of Workmen's Compensation Administration. The report is the result of numerous discussions and a careful study of the administration of the law. If incorporated into the law and the administrative procedure, the recommendations offered here ought to make impossible some of the gross abuses which have developed, although it is well realized that it is impossible to insure ethical behavior by legal rescript and that any law will be respected only when it reflects and represents the general sentiments of the community.

In the problem of fee-splitting, education of the public both within and without the medical profession appears to be indicated if this practice is to

be eradicated.

The following is a statement of the recommendations which seem reasonable and enforceable, together with a terse presentation of the reasons for them.

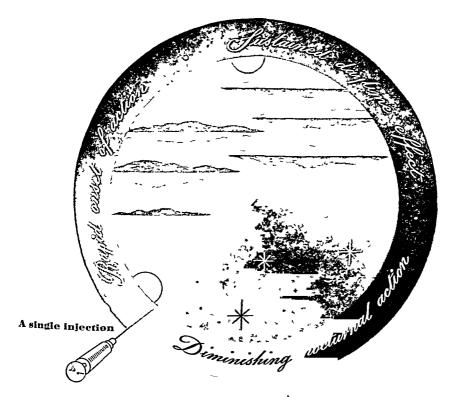

#### Recommendations

- I. Survey of Medical Procedures.—Many criticisms have been made of the present system, to the effect that treatment often has been: (1) inadequate, (2) unnecessary, (3) delayed, and (4) unduly prolonged. Unfortunately, no precise data are available to appraise the situation. The Committee therefore recommends:
  - That the Department of Labor make efforts to secure a state appropriation for a study of an adequate sample number of "closed" cases. This study is to deal with the medical aspects of Workmen's Compensation, such as the causes of the existing delays in securing treatment, the methods pursued by the various groups concerned with regard to the selection of physician, the kind and course of treatment, the decisions as to operation and after-care, the stoppages in treatment, the kind of injuries treated, and the methods pursued in the treatment of similar injuries, the time necessary for treatments of similar character, a comparison between the adequacy of treatment provided by the self-insurer as against the ordinary carrier, the comparison of adequacy of results by individual physicians as against medical bureaus, and many other points of similarly vital character.

II. Certification to Render Medical Care.—Under the present law physicians are authorized to render medical care under Workmen's Compensation by the Industrial Commissioner upon the recommenda-

# Insulin action *timed* to the needs of the day

### WELLCOME' GLOBIN INSULIN WITH ZINC

As the diabetic goes through the day, his insulin requirements vary. Wellcome' Globin Insulin with Zinc provides an action timed to meet these changing needs. An injection in the morning is followed by rapid onset of action which is sustained for continued blood sugar control as the day wears on. Finally by night insulin action begins to wane, minimizing the occurrence of nocturnal reactions.

Many moderately severe and severe cases of diabetes may be controlled with only a single, daily injection of 'Wellcome' Globin Insulin with Zinc. This new long acting insulin is a clear solution of uniform potency. In its freedom from allergenic skin reaction, it is comparable to regular insulin. This advance in diabetic control was developed in the Wellcome Research Laboratories, Tuckahoe, New York. U. S. Pat. 2,161,198.

Vials of 10 cc. 80 units in 1 cc.

Wellcome' Trademark Registered

[Continued from page 928]

tion of the county medical societies. The Committee recommends:

2. That the responsibility for certifying physicians for Workmen's Compensation practice remain in the hands of the Industrial Commissioner and the county medical societies, as provided for in the present law, and that efforts be made to bring about improvements in the qualification of specialists and their certification.

3. That a physician who has been refused endorsement by the county society have the right to appeal to the Industrial Commissioner and the courts but not, as at present, to the Industrial Council, whose functions and composition should

be altered as provided in this article.

Compensation Medical Bureaus.-Under the present law compensation medical bureaus and laboratories are licensed by the Industrial Commissioner upon the recommendation of the county medical societies, but there is no definition of a Compensation Medical Bureau in the law, and the law provides no penalty for the operation of an unlicensed bureau. Inasmuch as these bureaus, unless they are operated by commercial concerns for their employees, constitute the practice of medicine on a business basis, the Committee recommends:

That the law adequately define Compensa-

tion Medical Bureaus.

That Compensation Medical Bureaus other than those operated by an employer for his employees be prohibited.

That the ownership or operation of any un-

licensed bureau be made a misdemeanor.

Commercial Laboratories.—Because of the well-known and recently well-aired abuses of commercial laboratories, the Committee recommends:

- That the law require that in order to qualify for a license under Workmen's Compensation a laboratory must be owned, operated, and the work supervised by a physician duly licensed to practice medicine in the State of New York and who has been qualified and certified under the existing laws with regard to the directorship of clinical laboratories
- V. Revocation of Authorization to Practice.—One of the most publicized evils of the present system is the way in which unethical conduct on the part of physicians, insurance adjusters, employees of the State Insurance Fund, and others has been allowed to go unchecked. This is partly due to the lack of provision for effective implementation of that section of the Workmen's Compensation Law (13-d) which prohibits the division or assignment of fees and other unethical practices.

While the county medical societies have been empowered to try physicians on charges of misconduct, no one is specifically designated to initiate charges, and little provision has been made for their The Committee therefore recominvestigation.

mends:

That the State Labor Department be made responsible for initiating charges and investigating cases of unethical conduct among physicians rendering treatment under Workmen's Compensation, but opportunity should also be given to other interested parties to file charges.

That provision be made in the budget of the Labor Department for a proper investigatory

staff to operate on a statewide basis.

That the county societies retain the power to try physicians so charged.

That to make possible the carrying out of this responsibility the county medical societies be specifically granted powers to subpoena witnesses and administer oaths, and be provided with legal assistance by the State.

12. That if the county societies do not take action the Industrial Commissioner shall exercise his right to make his own investigation and try cases independently and that to this end the law be amended, giving the Industrial Commissioner the right to hold hearings as well as to make investigations.

That it be made mandatory that any physician found guilty of violating the provisions of the Workmen's Compensation Law be removed from the list of those authorized to render treat-

ment under Workmen's Compensation.

Fee-Splitting and Rebates.—Since fee-splitting and acceptance of rebates are not limited to Workmen's Compensation cases, it is desirable that the Education Law be amended to make these practices on the part of physicians licensed to practice medicine in the State of New York cause for disciplinary action by the Board of Regents when legally and justly proved. It is therefore recommended:

That an appropriate clause be added to Section 1264-2 of the Education Law, which specifies offenses for which licenses may be re-

voked or suspended.

15. That, in addition, an amendment to the Penal Law, making such practices a misdemeanor,

be enacted.

Arbitration Procedures.—Disputed bills are subject to arbitration by boards of four physicians, two selected by the carriers and two by the county society of the particular jurisdiction. The proceedings are held in camera with no record of any kind. Since the parties concerned agree to arbitrate, there is no appeal from the decisions made. The ma-chinery thus provided has not worked out satis-factorily and as a result few cases come to arbitra-Physicians prefer to make outside settlements, which is a bad practice and is contrary to the spirit of the law. Moreover, carriers frequently notify physicians to stop treatment because the compensability of the case is in question. In these instances the physician runs the risk of not being paid for services rendered. Many competent physicians quit under the circumstances. The claimant is thereby driven to the necessity of finding a physician who will take his case on the chance of having it paid for. Those who are in the compensation "business" and who run several bureaus and in that way take care of thousands of cases in a year can afford to do it; losing payment in some cases does not matter much. Indirectly, this is a way of "lifting" cases, To obviate the evils of the present system the Committee recommends:

That the physician's bill should be rendered in duplicate, one copy being submitted to the Labor Department and the other to the carrier. If the bill is protested by the carrier no outside settlement between the physician and the carrier should be allowed; the decision must be made by a medical appeal board and should be final.

That for the purpose of making up the medical appeal boards there be five regional panels in the State, composed of physicians who do not engage in Workmen's Compensation work

the gold medal  $\underline{\text{whiskey}}$ 

Distilled in peace time and Bottled in Bond for the supervision of the U. S. Government.

[Continued from page 930]

These panels should be appointed annually by the Industrial Commissioner from lists submitted by the medical societies and by the insurance carriers. Nominations by the medical societies should be subject to the approval of the carriers, and vice versa, so that the final list should consist of a group of physicians agreeable to each. such a method of selection boards of three physicians would be sufficient for any particular case. The selection of particular physicians should be left to the Industrial Commissioner, who should provide each appeal board with a stenographer, so that a verbatim record of the proceedings and of the decisions reached may be available. Members of the appeal boards should receive remuneration on a per diem basis.

VIII. Provision for Early and Uninterrupted Treatment and for Checks on Treatment.—The present law provides for the insurance companies to check on the adequacy or necessity of treatment by allowing them to have their own medical staff examine the patient. Frequently such examination is delayed for many weeks after treatment has been instituted. In order to provide for a more adequate and expeditious check on treatment, the Committee

recommends:

18. That in order to controvert compensability of claim the carrier must notify the claimant's physician of its intention to controvert within ten days from its receipt of the C 104 Form.

19. That if the carrier controverts for medical reasons, it must submit to the referee and to the claimant's physician a report of a medical examination made on its behalf indicating the medical grounds on which the case is controverted.

That in order to protest the necessity or character, frequency, and adequacy of treatment, the carrier must have an examination of the claimant made within five days of the receipt of the C 4 Form and must submit to the claimant's physician a report of this examination five days after it has been completed. In exceptional cases, these time limits may be extended by the Industrial Commissioner. If, following this examination, the claimant's and carrier's physicians disagree, the patient must be referred immediately to the Labor Department for medical examination and opinion.

21. That in prolonged cases, the carrier should follow the above procedure upon receipt of each

C 14 Form.

IX. Medical Division of the Department of Labor. The adoption of these recommendations would impose additional work on the already overburdened staff of the Medical Division of the Department of The Committee therefore recommends: Labor.

That the staff of the Medical Division be

materially increased.

That the salaries of this staff be made more in line with the responsibilities attached to the positions and with provision for a sliding scale of salaries based upon duration of satisfactory serv-

ice.

That the staff be prohibited from engaging in private practice between the hours of 9:00 A.M. and 5:00 P.M. and from workmen's compensation practice at any time: However, all members of the staff should be required to participate in active medical work in hospitals, and to that end provision should be made for two halfdays a week for participation in in- or outpatient work.

That the medical quarters of the Department of Labor be enlarged, properly lighted and arranged, and adequately equipped and staffed to suit the requirements of this very important office. Provision should be made for an adequate x-ray department with proper equipment and staff.

X. Impartial Medical Examinations.—It has been charged by some that the presence of the carrier's physician at the examinations in the Labor Department at times influences the decision of the staff physician. It is therefore recommended:

That both the carrier's and the claimant's physician be barred from the examination by the Labor Department staff and that the staff physician rendering the examination should have no knowledge of the carrier involved in the case.

The present law prvoides for the adjudication of difficult medical cases by a "specially qualified physician" selected from a panel, the membership of which is designated by the county medical society. It has been stated that these physicians are not always impartial, that they are not fully acquainted with the specific problems of compensation medicine, and that they are infrequently called upon because of the expense involved. On the other hand, there has been no complaint against the work of the Silicosis Board, which consists of three permanent members appointed by the Industrial Commissioner on a part-time basis. It is therefore recommended:

That similar boards be established in other 27. specialties for the adjudication of difficult cases which cannot be settled in the State Labor Department and for appeals from the decisions rendered in the Labor Department. These boards should pass on questions of causal rela-

tionship, extent of disability, and treatment.

28. That at the present time such additional boards be established in (a) neurology, (b) orthopaedics and general surgery, and (c) internal medicine. The survey above recommended would probably indicate in what further enoughly indicates in the present time such additional boards be established in (a) neurology, (b) orthopaedics and general surgery, and (c) internal medicine. probably indicate in what further specialties such boards should be established in the future.

That cases be referred to these boards by the Medical Division of the Labor Department or on request of a referee, the claimant's physi-

cian, or the carrier's physician.

30. That these boards should be appointed by the Industrial Commissioner from among physicians of recognized high character and of high professional repute. These physicians should be barred from otherwise practicing under the Workmen's Compensation Law.

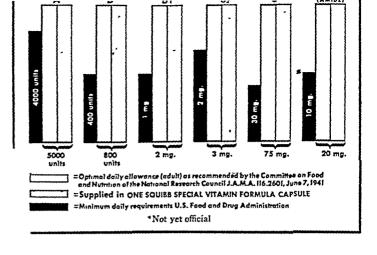

XI. Industrial Council.—Under the law as amended in 1935 the Industrial Council consists of fifteen members appointed by the Governor, five of whom represent the interests of employee, five the interest of employer, and five the medical profession. Although the law states that the function of the Industrial Council is to advise the Industrial Commissioner, it vests it with investigatorial, administrative, and judicial duties as well as those of an advisory nature. It is recommended:

31. That these nonadvisory duties which are described in the Labor Law, Section 10-4 (f), (g), (h), and (i), should be transferred from the Industrial Council to the Industrial Commissioner, where they rightfully belong.

The other specified duties of the Industrial Coun-

<sup>&</sup>lt;sup>1</sup> National Research Council, Reprint and Circular Series No. 115, January 1943.

[Continued from page 932]

cil as described in the law pertain largely to medical matters, and in the opinion of the Committee should be carried out by a group composed entirely of physicians rather than by a mixed group of physicians and laymen. It is our understanding that plans are being drafted to decrease the membership of the Industrial Council to nine, with three representatives for employers, three for labor, and three for the medical profession. The Committee therefore recommends:

That the medical members of the Industrial Council serve also as an independent medical board to advise the Industrial Council on all matters pertaining to the medical phases of the administration of the Workmen's Compensation Law. The members of this medical advisory board would be appointed by the Governor from among men of high professional repute and character and who enjoy the confidence of the various accredited medical groups in the state. They

should not engage in workmen's compensation practice. For the performance of their duties on the medical advisory board they should be entitled to per diem allowance.

XII. Annual Reviews.—In order to assure a rational evolution of the administration of the Workmen's Compensation Law and to obviate the need of more or less explosive inquiries every ten years or so, it is suggested:

That in so far as the medical aspects of the Workmen's Compensation Law are concerned, the Governor appoint each year a committee of physicians to review the situation and to suggest such studies or changes as might be indicated in order that weaknesses of the Law or of its administration might be detected and corrected as soon as they become discernible and before they attain undue proportions.

January 24, 1944

#### CHEMIST SEES POSTWAR FOOD USE FOR DRIED BANANAS

Dehydration of fruit now being wasted in the great banana-growing areas of Middle America may offer a source of additional food to help meet the world's postwar food needs,

This is suggested by Donald F. Othmer of the Polytechnic Institute, Brooklyn, New York, a chemical engineer and authority on acetic acids, in a report to the Inter-American Development Commission, Washington. His report is based on studies of banana utilization made in Honduras last year.

Dehydration of bananas for export already is being done in Honduras and Brazil. However, Mr. Othmer believes possibilities for utilization of wasted

fruit through drying are far from exhausted.

Preservation of bananas can be accomplished simply by removal of about 75 per cent of the water

content, he explains, and continues:

"The drying operation may be conducted on the whole fruit after peeling. Or the bananas may be pulped or emulsified before drying in a spray dryer. These operations give a fine powder.

"A peculiarity of the banana is that in the green state it has a high carbohydrate content as starch. This starch is self-converted to sugar during the ripening process. Thus either a high starch-containing food or a high sugar-containing food may be obtained at will.

Green bananas are thus used to make a banana powder or flour of starch content similar to wheat flour for bread-making. Ripe bananas are used to give a special powder of high sugar content for cakes

pastries, milk drinks, etc."
He reported that in Mexico, particularly the provinces of Tabasco and Chiopas, large amounts of

bananas are being wasted.

Dehydration of bananas, he pointed out, permits preservation and storage of the fruit during periods when banana stems cannot be shipped. Thus the dried material can be accumulated until shipping and increased demand for food make use of the dehydrated fruit desirable.—Release from the Office of the Coordinator of Inter-American Affairs

#### ART AS AN ADJUVANT IN ILLNESS

Mr. Adrian Hill, RB.A., a British artist, describ a successful experiment conducted by himself at famous sanitorium in England. This story of an e periment in occupational therapy, as originally pu lished in *The Studio* has been reprinted in part in t March 1944 issue of *The Canadian Hospital* (page 60).

The author states that "A desire for self expre sion is inherent in us all, and to encourage this un at a time of physical inaction might very well n awaken a latent talent for drawing and painting."

With this thought in mind, Hill obtained permis sion to put his theory into operation at the sanito rium, first in a ward for service casualties and after wards in more permanent departments for civilian patients.

He found his audience eager to listen to any scheme whereby the tedium of illness might be alleviated. From purely curiosity the patients soon developed a desire to grasp the opportunity of indulging in some form of self-expression. The benefits grew out of happy occupation in the job rather than from the purely aesthetic value of any finished product.

The class varied in size from week to week according to the state of health of the individual. Half of the regular "students" were bedders who were visited in turn and their work and problems discussed individually.

"With regard to the actual method of instruction," comments Mr. Hill, "I have always to remember that much depends on the asthenic mental condition of the patient. In some cases emasculation prevents them physically from carrying out their ideas, and when this is the case we talk instead about some interesting aspect of picture-making or look through some reproductions of Old Masters, so that the cultural interest is retained until such a time as they feel strong enough to take up their pencil and brush again."

The benefit of art over other therapy classes, suggests the author, is that the germs of art appreciation plus a certain working knowledge of drawing and painting will continue to bear fruit throughout the years of normal life, while the making of useful and fancy goods will be relinquished most likely forever when the patient is fit enough to leave the institution.

HEW ANALGESIG . SPASMOLYTIC. SEDATIVE For Oral and Intramuscular Administration

Welcome news to a large number of physicians:

#### Demerol hydrochloride is now available

HE analgesic effect appears to be between that of morphine and codeine, and it persists for from three to six hours.

Demerol has many indications in medicine, surgery and obstetrics.

Before prescribing, physicians should read carefully the booklet on Demerol hydrochloride (sent free on request). Please mark prescriptions: "Do not refill."

Supplied for oral use, tablets of 50 mg., for injection, vials of 30 cc. (50 mg. in each 1 cc.) and ampuls of 2 cc. (100 mg)

#### HYDROCHLORIDE

Brand of MEPERIDINE HYDROCHLORIDE

WINTHROP CHEMICAL COMPANY, INC.

Pharmaceuticals of merit for the physician

NEW YORK 13, N. Y.

WINDSOR, ONT

The combination of iron-liver-vitamin B complex therapy in secondary anemia produces a better result than iron alone, states Gottlieb.\* In addition, "This recovery is lasting and is not followed by a relapse when the therapy is discontinued."

Investigators also stress the value of the crude form of liver extract whose valuable factors have not been removed by "purifying."

Formulated to meet these requirements is the hemopoietic tonic and nutritional supplement

# EPAT

The unusual palatability of Elixir Hepatinic is important since prolonged administration is generally indicated in anti-anemia therapy.

Each fluid ounce contains: Ferrous Sulfate 12 gr., Crude Liver Concentrate (equivalent to 660 gr. fresh. liver) 60 gr., Thiamine Hydrochloride 2 mg., Riboflavin 4 mg., Niacin Amide 20 mg., together with pyridoxine, pantothenic acid, choline and other factors of the vitamin B complex.

Hepatinic is supplied in bottles of one pint and one gallon.

worker suffers recurring attacks, he should be transferred to a job where he does not come in contact with irritant.

Protective clothing made from impermeable materials is preferred because it cannot become saturated with irritants. This clothing should be cleaned daily.

Protective ointments are helpful when such clothing is not practical or available. There are two types of protective applications—the water soluble (invisible glove) type, and the innocuous fat type—the first to repel oils and petroleum solvents, the second to prevent them from entering the pores and to buffer their action on the skin.

The chief causes of dermatitis are cutting oils, used in the manufacture of motors, tanks, shell casings, projectiles, and airplanes wherever cutting and turning metals is performed. These oils are the soluble and the insoluble types. The soluble rarely cause dermatitis despite the fact that they usually contain bacteria.

The insoluble are usually sterile, yet they are the principal causes of cutting oil boils, and dermatitis. The metal slivers in them may wound the skin; the sulphur, chlorine, and inhibitors they contain may imiate the skin; the petroleum oil itself may plug the pores, causing comedones which may form boils if infected by bacteria from dirty clothing or unwashed skin.

#### ON OCCUPATIONAL SKIN DISEASES

As reported in the National Safety News (March 1944), skin ailments are the most common of occupational diseases.

In an average pre-war year their cost to the nation was estimated at considerably more than 100,000,000 dollars a year in medical care and compensation alone. Today the frequency of such diseases and their total cost are much greater.

New industries, particularly, those concerned with the war effort, have contributed many new causative agents and a greatly increased exposure. However, experience has shown that it is not necessary to come in contact with highly toxic or irritating materials to cause dermatitis.

While these high-powered irritants are serious offenders, lack of cleanliness has been established as a factor in a large portion of dermatitis cases. Lack of lavatory facilities and proper cleansing agents, dirty work clothes, and careless washing habits all contribute to personal uncleanliness.

Since the cause is a factor in both the treatment of dermatitis and in prevention of recurrences, every effort should be made to determine the causative agent. In doubtful cases the patch test is often employed.

Once the ailment has been diagnosed as occupational dermatitis, treatment should be directed toward protecting the skin from further injury. As a general principle, only mild medicaments are ad-

vised in acute cases.

Many mild cases are permitted to work while under treatment. They often develop an immunity after recovery. Severe cases should be removed from irritant while under treatment. When a

#### MEDICAL HISTORY OF WAR BEING COMPILED

Members of the Museum and Medical Arts Service of the Army Medical Corps, in the European Theater of Operations, are compiling a medical history of the war, recording in photographs and drawings the new surgical technique and unusual treatment of disease.

A simplified method of applying plaster casts in the field has been photographed by Sergeant Joseph G. Nalepovic of Silver Spring, Maryland. A series of twelve pictures was made in which the various

stages of applying the plaster is demonstrated.
Sergeant Clifton B. Potter, Beverly, Massachusetts, has contributed a drawing of the rare eye disease called coloboma, which is an unnatural growth in the interior of the eyeball. "I climbed into a sterile gown and stood by the surgeon and looked over his shoulder," explained the Sergeant. didn't actually draw in the operating room, but took quick mental notes and transposed them later into sketches. These sketches were enlarged into pictures of each step in the operation."

Captain Ralph D. Reed, Bethesda, Maryland, formerly a bacteriologist with the United States Public Health Service, with the aid of three photographers and two medical artists, has set up an "art gallery" and dark room. He and his staff take motion pictures of any operation or treatment which are valuable for future study by Army doctors.

### OOPER CREME No Finer Name in Ethical Contraceptives NEW YORK, N. Y.

WHITTAKER LAKORATORIES. INC.

THERE ARE many sound reasons why OVOFERRIN is the preferred hematinic and tonic in run-down conditions. But basically, these stem from the fact that it is a unique colloidal iron-protein, and it has many noteworthy therapeutic advantages over the iron salts (sulphates, citrates, etc.). The ionizable salts are split up in the alimentary tract with the release of ions likely to be astringent and irritating. In the intestines the iron ion precipitates may dehydrate and constipate, are less efficiently assimilable.

OVOFERRIN'S colloidal iron-protein on the other hand does not release irritating ions in the stomach. It arrives in the intestine as a fully

hydrated colloidal oxide, a logical, nutritional form which is readily assimilable and can not constipate.

In the run-down business man, school child or housewife, OVOFERRIN produces prompt nutritional improvement, appetite stimulation and a better blood picture. Its palatability, its freedom from odor and from staining properties assure patient cooperation But these qualities are not the result of sweetening, masking, or coating They are inherent in OVOFERRIN'S colloidal form Dosage—1 tablespoonful in a little milk or water at meals and bedtime.

in the Medical Management of BILIARY TRACT DISEASE

The administration of Decholin (dehydrocholic acid) or Decholin sodium (intravenous) produces a copious outpouring of thin liver-bile, secreted under increased pressure. This flushing of the bile passages removes mucus, inspissated bile, gravel, and pus if present. The resultant improved drainage is the keystone of present day therapy in chronic cholecystitis, noncalculous cholangitis, hepatic insufficiency, biliary engorgement, biliary dyskinesia. It produces not only appreciated symptomatic relief but also demonstrable objective improvement.

Decholin is contraindicated only in complete obstruction of the common or the hepatic bile duct.

GASTRON is an original extract of the organic and inorganic constituents of the entire mucosa of the hog-stomach, including the pylorus. The acidified and aromatized extract is incorporated in an aqueous-glycerin-propylene glycol menstruum which preserves the enzymatic activity. The preparation contains no alcohol. It is accurately standardized by assay.

GASTRON is indicated as replacement therapy in atrophic gastritis, and as an aid in the treatment of chronic gastritis. It is of value as adjunctive treatment in the anemias, and in certain gastric deficiencies associated with convalescence and old age. It is worthy of trial in the nausea and vomiting of pregnancy.

GASTRON WITH IRON also is available for prescription use

Broadway PHARMACEUTICAL CORP. West AVENDISH

# HARASSING ANNOYANCE

# Papulosum Tarbonis effectively accomplishes the

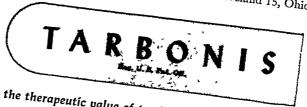

aims of therapy in papular eczema: It relieves the harassing pruritus-stops scratching, thus putting the involved tissues "at rest"—promotes required lymph circulation—stimulates healing.

With its high therapeutic efficacy Tarbonis combines a much appreciated cosmetic aspect. It is ODORLESS, there is no vistage of tarry odor. It is GREASELESS, since it is a vanishing-type cream. It is NON-STAINING and NON-SOILING; it cannot be detected on the skin after application; linen and clothing are in no way affected by it. No removal is required before reapplication. In consequence, though 3 or 4 applications may be needed during the day, the patient remains ambulatory.

Tarbonis presents an especially processed Liquor Carbonis Detergens (5%), together with lanolin and menthol, in a special vanishing-type cream. It is of equal value in all other forms of eczema of infants and adults, in psoriasis, in industrial dermatoses (dermatergoses), virtually regardless of the offending irntant. Tarbonis is available upon prescription through all pharmacies, and for industrial and dispensing purposes through accredited physicians' supply houses. It is supplied in 214, 8 and 16 oz. Jars and 6 lb. containers.

Physicians are invited to send for clinical test sample and the new, comprehensive brochure on tar therapy.

THE TARBONIS COMPANY 1220 Huron Road, Cleveland 15, Ohio

All the therapeutic value of tar in an odorless, greaseless, non-staining, non-soiling, vanishing-type cream

# HESODAT Brewer

The ORIGINAL ENTERIC-COATED TABLET
OF THEOBROMINE SODIUM ACETATE

to control frequency and severity of attacks in CARDIOVASCULAR AND RENAL DISEASES and to prevent EDEMA

Clinical experience and studies have proven the value of Theobromine Sodium Acetate in certain Cardiovascular and Renal Diseases. In Angina Pectoris, used adequately, it permits more work by the individual without developing precordial pain or distress. As one of the most effective Xanthine Vasodilators it helps increase the available blood supply to the heart and kidneys to increase the efficiency of these organs.

It has also been found an effective aid in treating and preventing Edema of Cardiac or Renal origin. The enteric coating (especially developed for Thesodate) permits larger doses without the drug's contact with the Gastric Mucosa.

Pharmaceutical Chemists Since 1852

IN ADDITION to being

well belerated systemically, Mercuhydrin\* is significantly free from reaction at the site of injection when given intramuscularly. It is rapidly absorbed following inframuscular injection and is compatible with the local tissues; hence, its freedom from reaction by this route. Accidental extravasation during intravenous injection has not resulted in serious tissue damage. Mercuhydrin thus may be administered by either route with complete assurance . . . Mercuhydrin if indicated in the edema of cardiorenal disease.

nephrosis, and ascites of liver disease. Its diuretic action has been shown to be fully satisfactory, both as to quantity of urine excreted and duration of effect. In these conditions. Years of careful experiment and clinical work have established its safety and therapeutic value.

\*A derivative of trea, the sodium salt of methoxyoximercuripro-

pylsuccinyllicea with thepphylline.

Mercuhydrin is supplied both in 1 cc. and 2 cc. ampuls.

Literature and samples on request.

NUMOTIZINE, INC. • 900 N. FRANKLIN ST. • CHICAGO, U.S.A.

THE recent careful study conducted by Kirwin, Lowsley, and Menning, of the James Buchanan Brady Foundation for Urology, New York Hospital, and published in the December 1943 issue of *The American Journal of Surgery*, reaffirms the many previously published reports emphasizing the clinical effectiveness and complete safety of Pyridium in the symptomatic treatment of common urogenital infections.

In this study of 118 cases of common urogenital infections, routine Pyridium therapy administered for a period of two weeks produced relief of the distressing symptoms in the following percentage of cases: Pain on urination was alleviated or abolished in 95.3 per cent of the cases; burning on urination was relieved in 93.6 per cent of the cases; frequency was greatly reduced or abolished in 85 per cent of the cases; and nocturia was reduced or eliminated in 83.7 per cent of the cases.

The prompt and effective symptomatic relief provided by Pyridium is extremely gratifying to the patient suffering with distressing urinary symptoms. Gratifying also is the confidence in the physician and his therapy which is so evident among patients who are treated with Pyridium.

More than a decade of service in urogenital infections

PYRIDIUM

(Phenyleze-alphe-eliphe-diamine-pyridine mane-hydrechleride)

# Rediforme

# for FLAT-FEET

The family physician, in health examinations, will not over-look examining the feet of babies and growing children for evidence of flat-feet through heredity tendencies or other causes—and will naturally prescribe measures for correction.

Proper shoes are essential to supplement the doctor's own treatments—but a proper source of supply is essential, too, and the patient of any age-group should be directed to competent and trustworthy fitters of correctly designed shoes of scientific construction. Pediforme footwear have the qualities desired by the doctor and the attractiveness so vital to the sensitive patient.

# IODINE in wound antisepsis

★ Iodine accomplishes its germicidal action with minimal irritant action and without interfering with the normal healing rate of the tissue. Clinical evidence collected over a long period shows that effective wound antisepsis without irritation is achieved by the use of proper Iodine solutions.

Iodine is convenient and is economically fitted into the preoperative routine. It maintains its effectiveness in the presence of foreign proteins and its activity is of long duration.

#### IN SECONDARY ANEMIA

In the correction of the anemic state Livitamin not only leads to rapid hemoglobin regeneration, but also aids in the eradication of the usually associated conditions. Its iron is highly available and promptly utilized; its contained liver concentrate presents the fractions found valuable in the anemias; its rich

store of B-vitamins overcomes the frequently severe anorexia and corrects the nutritional deficiencies which almost invariably are encountered in hypochromic anemia. Since Livitamin is in liquid form, dosage is easily regulated. Its palatable taste is appreciated by all patients, and especially by children.

Each fluidounce of Livitamin presents: Fresh Liver (as concentrate) \_ \_ 1.5 oz. Thiamine Hydrochloride

(B<sub>1</sub>) (3 mg.) 1000 U.S.P. Units Riboflavin (B<sub>2</sub> or G) 1.00 mg. Nicotinamide (Niacin Amide) 25.0 mg. Pyridoxine Hydrochloride

(B<sub>6</sub>)

Pantothenic Acid \_\_\_\_\_\_\_ 2.315 mg.

Filtrate Factor \_\_\_\_\_\_ 20 J. L. Units

Iron and Manganese Peptonized \_ 30 gr.

In doses of 2 to 4 teaspoonfuls t. i. d.

Livitamin rapidly corrects hemoglobin

deficiency. Available in 8-oz bottles.

The potent uterine spasmolytic action of Pavatrine is such that its ability to relieve dysmenorrhea has been described as "morphine-like."

Yet, Pavatrine is non-narcotic, non-habit forming, devoid of narcotic manifestations.

Pavatrine is both neurotropic and musculotropic in action, thereby combining the clinical advantages of both atropine and papaverine, without appreciably displaying such side effects as vasomotor relaxation, mydriasis or depression of secretions.

If you have not received your clinical trial supply of Pavatrine, write to the Medical Dept., G. D. Searle & Co., P. O. Box 5110-C, Chicago 80, Illinois.

# SPENCER Breast Supports

For Prenatal and Nursing

Spencer Maternity Support Spencer Nursing Support

Each Spencer Breast Support for prenatal wear, like all Spencer Supports, is individually designed for the one patient who is to wear it, to lift and hold breasts in natural, healthful position, without compression.

It improves circulation—protects delicate inner tissues—helps prevent outer skin from stretching and breaking—aids breathing—improves appearance—encourages erect posture. Easily adjustable to increasing development.

Painful, engorged breasts are often relieved by a Spencer, as it allows veins to empty easily. (A further advantage is gained later in increased milk supply from equalization of circulation during pregnancy.)

GUARDS AGAINST CAKING AND ABSCESSING

The Spencer Breast Support for nursing mothers provides protection against caking and abscessing. Closes in front for nursing convenience.

Spencer Supports are never sold in stores. For a Spencer Specialist, look in telephone book under "Spencer Corsetiere" or write direct to us.

# STAYING Power

Aggressive little atom of American bird-life, the beautiful Humming-bird flies so fast that the eye can scarcely follow. It operates its wings with such incredible power and speed that it is enabled to stand still—literally poised in air—as it gleans the nectar of flowers.

Similarly, the ability to remain "poised" over painful areas is attributed to small quantities of EUCUPIN, the local anesthetic-analgesic agent. Like the Humming-bird, Eucupin possesses a remarkable kind of *staying power*—the kind that controls pain for longer periods than any other agent, the effect lasting for hours and even for days.

Eucupin has been especially formulated for particular indications. They are described in a literature booklet, which, together with samples, is available to physicians on request. Please indicate form desired.

Supply: Aqueous and oil solutions for infiltration; ointment and suppositories; tablets for solutions to be applied topically.

### Little David

The moral is simple—a small but well-aimed effort frequently does the trick.

In constipation, too, a well-directed therapeutic effort is more than a match for brute force. 'Agarol'\* Emulsion aims at "effortless" correction of constipation by providing soft bulk and lubrication, by holding moisture in the stool and by mildly stimulating peristalsis. 'Agarol' Emulsion does this deftly, providing the minimum stimulus needed for evacuation. And with 'Agarol' Emulsion there need be no griping, no leakage...

#### What Others Think, III

Under date of March 10, 1944, the Council on Medical Service and Public Relations of the A.M.A. sent out in bulletin form excerpts from various news sources relating to activities and trends in relation to medical affairs, medical legislation, and plans for rendering medical service. As an expression of lay opinion on trends in the public aspects of medicine the material in the bulletins should be highly useful to the medical profession as a means of relating its thinking to that of informed lay people who are devoting much sincere attention to the future of medical service in this country.

It would appear that few people here desire to follow slavishly patterns of public medicine imported from Europe, patterns originally laid down for political reasons and in the interest of the attainment of political objectives rather than the advancement of scientific medical practice. This has never been and is not now a nation of copyists.

In many aspects of public medicine we may lack experience, since the intensive industrialization of the people is a comparatively recent development here compared to what has been the practice in those European nations for many years, geared primarily to production for war. But there seems to be little doubt that as we progress we shall insist on doing things our own way to suit the needs of our own temperament and in conformity with our native ideas and standards of practice.

The following excerpts from the Council's bulletin reflect current thought about recent

proposals of various kinds having to do with medical affairs.

The two following items appeared in "Views on Many Topics" of the Chicago Daily News in February, 1944:

"Recent editorials regarding the proposed expansion of the Social Security Act neglect to mention the greatest objections to the plan, viz.: compulsory contributions by arbitrary deductions from pay checks and unfair discrimination against unmarried workers and their dependents in benefits paid. Advocates of so-called 'Social Security' always avoid the question of compulsion. In a recent letter in this column, H. L. McCarthy of the Social Security Board attempted a defense of the Act by referring to premiums for fire insurance. Fire insurance is not compulsory. If an owner wishes to carry his own fire insurance by providing a reserve for losses, as many do, he may do so. The same freedom should be given all workers in old age pensions, hospitalization, etc. The Act should be amended, abolishing compulsory contributions, allowing a worker to make his own decision.

"Let those who wish to do so apply for the insurance, but in the name of liberty and justice, do not force contributions from workers who consider as I do, the Act to be a dishonest racket.—F. R., Chicago."

The following editorial from the Charleston News and Courier of Charleston, South Carolina, was quoted in the Augusta, Georgia, Chronicle on February 19, 1944:

"Being of modest disposition and loath to blow our own horn, we would not have presumed to prescribe for the eminent medical profession, but since Dr. Wilburt C. Davison, dean of the Duke University School of Medicine, has suggested that doctors need advertising, we feel free to put in our two cents' worth.

"Doctors have outlawed individual advertising, probably with good reason, but that is no cause for avoiding institutional advertising, a form that has proved its worth in many a field. Dr. Davison said,

When check reveals hypochromic anemia, the most important step to take is to see that the patient is supplied quickly and efficiently with iron.

The iron supplied in Hematinic Plastules is ferrous iron—recognized as the ideal form for quick, thorough assimilation and conversion into hemoglobin. It stays in this form because it is hermetically sealed in soluble capsules that prevent oxidation.

And, as Hematinic PLASTULES quickly dissolve in the stomach, the ferrous iron in semi-fluid state is immediately ready for assimilation.

Available Plain or with Liver Concentrate; in bottles of 50, 100, 1000. A product of The Bovinine Company, Division WYETH Incorporated, Philadelphia.

PREC U S PAT OFF

communities had, for the most part, been unwilling to cooperate in local chamber of commerce functions, or were completely disinterested in their local projects.

"It was clearly stated-and I have heard it repeated a number of times-that the medical profession now seeks help on something of a very serious nature from these very people for whom the profession has had little or no interest or regard. . . .

"You will agree, I am sure, that doctors should take an active interest in the civic and health programs of these chambers. Therefore, I should like to be bold enough, in the interest of harmony and out of regard for the local chamber of commerce, to propose that in your estimable publication and in your frequent bulletins you editorialize the suggestion that doctors take a more active financial and moral interest in these organizations. . . . Had such an effort been made by the A.M.A. and others, prior to the present threat of socialized medicine, I am confident the way would have been open to much more forceful and whole-hearted cooperation from those who have too long been neglected by too great a majority of your members."

Mr. Meek's advice is sound. For "chambers of commerce" in his text read any local civic activity, from the policemens' ball to voting in the primaries, from the meetings of the American Legion to those of the service clubs and so forth. "Too busy" is no excuse, though it may be an explanation, especially during a war. No time? Perhaps, but if you are not yet dead you have time. Too tired? Perhaps that, also; if so, ease up on something else, doctor. Public relations begins at home. It may originate in the office and in the hospital; it should commence there, but it should be followed up by initiative and active interest in those things outside of medicine proper which lie close to the heart of the man in the street, those things which are above and beyond your performance of cloistered duty, or the mere contribution of money to a worthy You are medicine's public relations representative, twenty-four hours a day.

#### Sustained Active Immunization

The subject of immunization, especially active immunization, cannot be overstressed. Prophylactic inoculations and chemotherapy constitute two of the stoutest pillars of modern medicine. Principles gleaned from research constantly in progress should be extensively circulated so that they can be speedily incorporated in medical practice. Military medicine has given a mighty impetus to the clinical application of such studies.

Diseases caused by toxins, such as diphtheria and tetanus, readily lend themselves to scientific studies because of the existence of accurate methods of titrating the antitoxin in the blood. The efficiency of active immunization by toxoids can be gauged by the titration of the resulting antitoxin. Such researches have taught us the total amount of toxoid needed, the number of injections needed, and the length of the intervals between the injections. Upon these three factors the successful outcome and duration of active immunity depend.

After some experimentation the number of injections optimal for immunity against preventable diseases has been fixed for such diseases as diphtheria, tetanus, typhoid and paratyphoid, and whooping cough. The interval between injections may vary in different diseases. In the case of diphtheria the New York State Department of Health now recommends an interval of a month between the injections. In the case of tetanus, better immunity may be obtained by lengthening the interval to two or three months, for antitoxin so elaborated persists for a longer period and tends to reach a higher titer. These conclusions can be easily reached by quantitative studies when toxoid antigens are used, but such is not the case with bacterial vaccines. However, because of analogy with the toxoid immunizations, the trend has been to lengthen the interval between injection of vaccines. That better and more lasting immunity is so attained is suggested by animal protection studies.2.3

No active immunization produces absolute and permanent immunity. Even vaccination against smallpox, which involves inoculation with a live virus, generally does not produce permanent immunity. Hence the need for revaccination from time to time-every five to seven years. Vaccination with dead microorganisms necessarily leads to immunity of shorter duration, reflected in a downward curve of antibodies a few weeks or months after vaccination. To boost this waning titer of antibodies. secondary injections are gaining favor. Tetanus toxoid is now injected annually after the initial prophylaxis, and the same may with profit be applied to diphtheria prophylaxis, which at present is perpetuated by triennial injections.

**EDITORIAL** 

in an address at Chicago, before the Congress of Medical Education and Licensure, that some persons either are 'too careless or uninterested to use' medical resources available to them. 'If, through advertising, a public demand can be created,' he said, 'for automobiles, electric ice boxes, certain brands of cigarettes, and patent and home medicines, the people can be taught to seek adequate medical service.'

"The medical profession not only could use some advertising of its services, as Dr. Davison advocates, but also it should give the public a good dose of publicity about itself for 'good will.' One of the principal political issues of the day is socialized medicine, and the politicians are going to work it for all it's worth to win popular support. An uncomfortably large number of persons, already placing faith in government as the nurse for their economic ills, are willing to turn to the same source for treatment when physically sick.

"The doctors need a job of selling not only in their role of medical men, but as private doctors, as opposed to public doctors. The News and Courier believes in the American system of private enterprise, and that goes for physicians, too. But some of its readers think otherwise, and it will take a lot of educating to convince them. It's up to the doctors to help their own cause. It pays to advertise."

An address by the Honorable Louis E. Miller of Missouri before the St. Louis Medical Society on the Wagner-Murray-Dingell bill and socialized medicine was included in the *Congressional Record* of February 3, 1944, under extension of remarks on Honorable Walter C. Ploeser in the House of Representatives.

Excerpts from this address follow:

"The Wagner bill, in so far as it attempts to create a system of socialized medicine, is nothing morethan a political opiate intended to dull all senses and make easier the final conquest of state socialism."

"Under the benediction of the present administration it has grown to its present size and activity with more than 3,000,000 persons on its pay roll. One agency of this New Deal octopus, the O.P.A., boasts a proud pay roll listing over 2,700 lawyers, while a similar organization in England, after which the Washington plan was largely copied, gets along with only ten attorneys. The great State of Pennsylvania conducts its business with 44,000 state employees, while at the same time the bloated bureaucracy of Washington maintains 215,000 federal employees on its pay roll for that state; the State of Wyoming transacts its business with fewer than 1,000 employees, but the federal government maintains over 6,000 on its pay roll to handle the federal business of this sparsely settled state. The federal bureaucracy has been termed a Frankenstein monster, but what can be said of the monstrosity known as the Wagner-Murray-Dingell bill?"

In discussing postwar planning, Labor's Monthly Survey (American Federation of Labor, Vol. 5: No. 2, Feb., 1944) contains on page 1 the following paragraphs which are highly significant, coming from this source:

"Do we want a great bureacuracy to dominate American life after the war, with dictators like those we now have who can set aside collective bargaining agreements without even considering the facts on which these agreements are based? Do we want to be ruled by individuals from whose decisions there is no appeal? Do we want domination by the military? This is the Fascist way, not the American way. Yet the surest way to get this very dictatorship is to fail now to set up a democratic civilian agency to direct postwar policy, with assured representation of all groups concerned.

"Without definite policy directives, determined by a representative civilian group, we shall have chaos and confusion which will provide the opportunity for the government to take over as in Germany and

Italy."

Doctors, however, will have to realize more acutely than they have in the past the obligation which, locally, is theirs as representatives of the medical profession. They will have to interest themselves in local projects more actively than they have done. The public relations of the profession cannot be left in the hands of the Council of the A.M.A. alone, or be reposed in the public relations bureaus of the state societies or the county societies and there be left for someone else to attend to. These bodies have their proper usefulness, but the burden of the maintenance of good public relations rests, in the final analysis, on the shoulders of the individual physicians in each community.

Better cooperation and more cordial relations of the medical profession with chambers of commerce throughout the country are no doubt much to be desired. That it is felt the doctors have not evinced sufficient interest in such bodies devoted to civic improvement is indicated in a letter from Mr. J. T. Meek, executive secretary of the Illinois Federation of Retail Associations of Chicago, to Dr. Morris Fishbein. The following items are from the letter:

"There were indications from the chamber of commerce secretaries that they had had no easy time, on several occasions, interesting their members in the grave possibilities of this program (S. 1161) for the simple reason that doctors in their

#### RADIUM IN PRESENT-DAY THERAPEUSIS

Douglas Quick, M.B. (Tor.), New York City

A TPRESENT radium is not being used to the full extent of its proved value in the treatment of malignant neoplastic diseases. This situation has been brought about over a period of several years and by a combination of circumstances.

Radium, as a source of energy of therapeutic value, gained a measure of popular favor at an earlier date than x-rays. During these earlier years, while x-rays of the lower voltages only were available, radium made rapid progress. This progress was marked in the demonstrated influence of radium on tumor tissue and also in technical advances for the actual application of radium. The progress made, and the experience gained, was largely on an empiric basis. The clinical material available for treatment represented chiefly advanced stages of cancer. Control of growth was soon found to be dependent on the heavier applications of radium-larger dosages. The refinements and accuracy of presentday dosage determinations were unknown. It was but natural that very many distressing and painful reactions were experienced. It was but natural also, in view of the advanced character of the material and the known average curability of cancer, that many of these distressing and painful reactions never benefited or profited the unfortunate victims of such advanced disease. However, those reactions, necessary as they were in the development of a new agent and in spite of the lethal character of the disease, created a very unfavorable impression with the public and with a substantial group in the profession. That impression has had a lasting, unfavorable, and unfortunate influence on radium therapy during the intervening years.

During those early years of developing radium therapy the progress was rapid to the point of being spectacular. Clinical observations of sound and lasting value, supported ultimately by physical proof, often preceded the physical investigations which helped to put the entire program on a sound physical as well as a sound clinical basis. Time does not permit enumeration of the various steps of rapid progression from the simple lead-encased radium tube on the surface to telecurietherapy, or from that same tube on the surface to various methods of intracavitary and interstitial irradiation with varying types and degrees of filter. The important point is that it was a period of great activity. It stimulated a

renewed interest in the cancer problem in general. Radium had, at once, a large audience.

The development of the gold radon tube, or seed, by Faills in 1924 and 1925, to replace the glass radon implant was the last of the spectacular improvements and developments in a very busy, stimulating, and eventful ten-year period.

Following my first use of the gold radon seed in 1925, thus opening a much wider range of usefulness for radium, the work in radium therapy settled down to a course of less spectacular but steady progress. That progress, however, has not been so uniform or so widespread as it should have been.

Sufficient quantities of radium to insure adequate range of facilities were available in very few places. Emanation-producing equipments were still more scarce. Small amounts of radium were acquired by many individuals and institutions under varying circumstances. Some few remarkable examples of unusually good work stand out as monuments to men of caution, judgment, and keen observation for their often singlehanded work with these small radium supplies. On the whole, however, the small independent radium supply in inexperienced hands has, in the past, done much to discredit radium therapy. The errors were chiefly of insufficient dosage and were often made in an effort to extend the use of radium too widely. (It is hoped that with certain altered conditions the small supply will, in the future, prove to be very valuable in its local community.)

About the time that radium therapy was becoming stabilized and some of its limitations, as well as its values, recognized, improved equipment for x-ray therapy became available. Since that time, the development of x-radiation, in all of its phases, has been more rapid and more spectacular even than that of radium in its initial period.

The rapidly developing x-ray therapy equipment had the advantages of a well-established experience in the physics of radiation. Training in departments of radiology was being organized on a national scope. The young man in roent-genology had available good equipment and good facilities for instruction at many centers at least. X-ray therapy was completely "within the department"—there was no outside influence or control over it, except perhaps in a very indirect way. Most or many of these same departments had no radium supply, a very limited supply, or a supply available under certain con-

Read before the New England Roentgen Ray Society, Boston, January 21, 1944.

Better immunity against typhoid fever may also be retained by a single annual injection instead of three spaced injections administered every two or three years. Immunity against whooping cough may conceivably be better maintained by annual or biennial injections. It also has been demonstrated that booster inoculations cause a more rapid elevation of antibodies if a fluid instead of an alum medium is used.<sup>4</sup> This is important in prophylaxis against tetanus.

<sup>4</sup> Miller, J. J., and Humbert, J. B.: J. Pediat. 23: 516 Nov.) 1943.

These lines of investigations of active immunization all point in one direction. The trend is undoubtedly to inoculate at longer intervals than has been the custom. To perpetuate a higher and more constant level of immunity, use of a single annual booster dose is gaining increasing support. Fluid preparations should be used for booster injections if a speedy rise of antibodies is desired, as in continued tetanus prophylaxis.

Sustained active immunization is a distinct advance in the field of prophylaxis.

#### Correspondence

Greater New York Councils Boy Scouts of America 120 West 42nd Street New York, New York March 22, 1944

Dr. Peter Irving Medical Society of the State of New York 292 Madison Avenue New York City Dear Dr. Irving:

We operate several summer camps for the New York City Boy Scouts as a nonprofit enterprise. You were kind enough to help us in securing doctors for these camps in previous years. Would you be willing to make our needs known to the members of your society again this year?

You may well appreciate the difficulties being encountered by us in trying to staff our camps, especially with doctors. It occurs to me that for one reason or another doctors may be available who would wish to spend their vacation period of a few weeks, a month, or even the whole summer at our camp.

Will you tell me if you can assist us by publishing a notice of our need in your society's bulletin?

I will be glad to furnish any further information you may desire.

Thanking you, I am Very sincerely,

WILLIAM G. KEOUGH
Assistant Director of Camping

#### A.M.A. Public Relations Council Opens Washington Office

It will be good news to our membership that a Washington Office has been established by the Council on Medical Service and Public Relations of the A.M.A. under the chairmanship of Dr. Louis H. Bauer. The office has been opened in the Columbia Block of the Doctors' Hospital at 1835 Eye Street, N.W., Washington, D.C., Suite 900. A secretary has been engaged and two telephones are available.

Under an arrangement with the Medical Society of the State of New York, Dr. Joseph S. Lawrence, Executive Officer of the Society, is acting for the time being in the capacity of consultant and is spending about half of his time in Washington. His long experience as director of the Albany office of the New York State Society should assure the success of the Washington office of the A.M.A. if the proper and necessary facilities are made available. The office is already busy establishing contact with the legislative and public relations committees of the various States of the Union. Dr. G. Lombard Kelly is the permanent secretary. He will spend part of his time in Washington and part in Chicago.

In considering radium as an aid to either surgery or x-rays it must be thought of in terms of surface, intracavitary, or interstitial application.

It is only in the dermatologic field that there may be some overlapping between radium and x-rays. Most of this work is now handled by xradiation and yet I believe there are cases in which, with adequate experience, a more satisfactory result may be obtained with radium. This applies to some of the very superficial lesions in prominent locations, but more particularly to fully differentiated skin can cerin awkward, complicated locations where both appearance and function are especially important ultimate considerations. As an example, I would suggest the insignificant-looking but deeply infiltrating growth at the side of the nose, in the nasolabial fold. It is a condition in which radium needles are infinitely superior to any other manner of irradiation. The facility of accurate application favors radium in some of these tedious locations: it may be particularly so about the evelids.

As a source for external distance application I think we can at once dismiss radium from practical clinical consideration. Any consideration of telecurietherapy is for the biophysical laboratory at present.

This brings us to a consideration of the part that radium may play by intracavitary and interstitial application, either alone or, more often, in combination with surgery or x-rays.

It would perhaps be more practical to consider these methods of application in connection with some of the major groups of malignant disease rather than as abstract technical problems. When it comes to using radium in body cavities or by needle or radon seed implantation, the complications of jurisdiction or surgical privilege are apt to arise. These complications all too often interfere with the best interests of the patient.

In that large group of epidermoid carcinomas involving the upper mucous membrane tract and with their metastatic extensions, I am sure most of you know how I feel about the intimate and essential part that radium plays—always by implantation and usually by radon seed implantation.

Radium is essential in the treatment of the primary growth of all but the totally undifferentiated anaplastic tumors—and most of these are in the hypopharynx. Surface application of radium should have no place in the mouth. Radium needles in very accessible locations and in firm, stitch-holding tissue may be used. Surface, but not contact, heavily filtered radium may be used to advantage, in conjunction with

surgery, in the maxillary antrum, accessory sinuses, or nasopharynx. In all these cases x-ray therapy goes without saying—it is routine: but it is the sole agent only in the totally anaplastic growths. There are a few very accessible primary growths of tongue, cheek, or palate where x-rays through cones may be used to advantage. However, I am convinced that the average intra-oral x-ray cone therapy does far more harm than good. It fails all too frequently to control growth, either through inadequate dosage or incomplete technical application, and it excludes radium from a place to which it is admirably suited. In the neck metastases, xray cannot completely control any but the totally anaplastic types-radical surgery is limited to a selected few of the fully differentiated. The majority of metastatic nodes are chiefly dependent on radium needle or radon seed implantation. in conjunction with surgical exposure for accuracy and following routine preliminary xray therapy. It is very unfair, however, to limit the treatment to x-radiation on the assumption that it can only be palliative. Such a position condemns the patient to no more than palliation, and usually short-term palliation at

What is said here with reference to neck nodes applies equally to metastatic epidermoid carcinoma elsewhere.

We hear of various fancy applicators for the use of radium in the larynx. Laryngeal cancer is an x-ray problem and radium should be reserved for the complications or recurrent cancer of the larynx—its use then is usually by implantation and in conjunction with surgery—usually cautery.

From time to time the use of radium—usually some type of implantation—is advocated for some growths in the bronchial tree or the esophagus. The inaccuracy, danger of induced infection, and lack of surgical drainage at once condemn such procedures. Throughout the entire period of radium usage it has been the poorly conceived or poorly executed procedure that has tended to discount, unreasonably, a very valuable agent.

With those of us who have been especially interested in radium it has been a matter of disappointment that it has not been able to contribute more in the field of breast cancer. It is true that cancer of the breast—a glandular type of cancer—follows a different clinical pattern than does the epidermoid carcinoma. However, trends again may be referred to as having an influence. The trend with breast cancer has always been strictly and traditionally surgical. The early Sampson Handley work with radium in connection with breast cancer surgery

ditions but controlled outside the department of roentgenology.

It is but natural that the younger radiologist has all too often grown up with an improper perspective on therapeutic radiology. It has not been his fault. Yet he suffers from incomplete training. Radium, as a valuable source of therapeutic radiation, suffers from lack of proper recognition. And, most unfortunately, the cancer patient fails to receive the benefit that might have been available with a better experience-perspective in coordination of x-radiation and radium radiation.

The universal availability of x-ray therapy today tends to relatively "oversell" that type of radiation to the disadvantage of its complementary source of therapeutic radiation—radium.

There are also other influences that have to do with the shift of radium to a lesser position than it properly should occupy. In medicine, as elsewhere, certain trends influence procedures in a progressive sort of way. Certain methods tend to become professionally fashionable and, all too often, to maintain their position largely by virtue of the high-powered professional advertising which supports them.

As previously mentioned, radium aroused a new interest in the entire cancer problem. Radiologists and pathologists were by far the more active workers in this revival and revision of cancer therapy. A recognition of this fact has in turn stimulated the revival of very radical surgery in cancer. It is difficult to keep the average young surgeon as deeply interested in the drudgery of therapeutic radiology as in the spectacular phases of radical cancer surgery. This flare for ultraradical surgery in cancer today, to the exclusion of a reasonable balance with therapeutic radiology, is permeating some established cancer clinics. Such clinics are looked to as patterns. The smaller clinic and the individual are apt to be influenced, and possibly misled, accordingly.

I fear that this is about where radium finds itself today—just a bit too much obscured by a series of influences which I have attempted to outline, and somewhat overshadowed by the more readily available x-radiation.

There should be no conflict between these two sources of radiotherapeutic energy. There is very little overlapping in their spheres of application. They are strictly complementary agents.

However, before proceeding with this phase of the discussion, there are a few very simple facts regarding radium that one should keep in mind.

Radium is a local agent. It represents, actually, a point source of radiant energy. The radon implant is the most progressive practical development in radium therapy. The only

gesture toward radium as a constitutional agent was our attempt of twenty-five years ago to use an active deposit intravenously. It was not practical but has had an interesting relationship to the use of radioactive isotopes at this present time.

In any treatment procedure, radium is rarely the sole agent used—except perhaps in certain skin lesions or some few inflammatory processes.

The question of selective action as between x-rays and gamma rays of radium has not been settled, although the weight of opinion seems to be against such variation in effect.

The relative range of an optimum exposure or treatment time has not been determined, except empirically per individual operator. It is quite possible that the prolonged exposure of the radon implant or the necessarily long exposure incident to a small initial radium supply may be the factor that confuses the question of favorable influence and selective action.

No practical means of increasing the ionization within the tumor-bearing area has been found.

No other means of either sensitizing the tumor to irradiation or increasing the resistance of surrounding normal tissue has been found. The problem is one of maximum dosage consistent with normal tissue tolerance, whether radium or x-rays are used.

Since radium is a local agent adapted to application in small space and, from practical necessity, at present, otherwise limited, it obviously is an agent to be used as a complement to x-radiation and to surgery.

The x-radiation and the radium radiation fill two different essential needs in technical application-each supplements the other in most instances, and this fact should never be lost sight of by the radiologist. No man should attempt roentgen therapy without a thorough working knowledge of radium. Whether he actually handles the radium himself or not, he should know when and how it should be done. should be no roentgen therapist. He should be a therapeutic radiologist. The need for this distinction and the need for correction of onesided training, as it too often exists today, has been noted many times in the examinations of the American Board of Radiology. I believe that plans are under way to correct this deficiency in training and I hope that, following the. war, radium in proper form will be more uniformly available.

There are few cases of malignant neoplastic disease in which at some time or phase in the treatment at least two, or frequently all three, of the principal factors in today's cancer treatment—surgery, x-ray, and radium—do not find useful application.

In considering radium as an aid to either surgery or x-rays it must be thought of in terms of surface, intracavitary, or interstitial application.

It is only in the dermatologic field that there may be some overlapping between radium and x-rays. Most of this work is now handled by xradiation and yet I believe there are cases in which, with adequate experience, a more satisfactory result may be obtained with radium. This applies to some of the very superficial lesions in prominent locations, but more particularly to fully differentiated skin can cerin awkward, complicated locations where both appearance and function are especially important ultimate considerations. As an example, I would suggest the insignificant-looking but deeply infiltrating growth at the side of the nose, in the nasolabial fold. It is a condition in which radium needles are infinitely superior to any other manner of irradiation. The facility of accurate application favors radium in some of these tedious locations: it may be particularly so about the evelids.

As a source for external distance application I think we can at once dismiss radium from practical clinical consideration. Any consideration of telecurietherapy is for the biophysical laboratory at present.

This brings us to a consideration of the part that radium may play by intracavitary and interstitial application, either alone or, more often, in combination with surgery or x-rays.

It would perhaps be more practical to consider these methods of application in connection with some of the major groups of malignant disease rather than as abstract technical problems. When it comes to using radium in body cavities or by needle or radon seed implantation, the complications of jurisdiction or surgical privilege are apt to arise. From time to time the use of radium—usually some type of implantation—is advocated for some growths in the bronchial tree or the esophagus. The inaccuracy, danger of induced infection, and lack of surgical drainage at once condemn such procedures. Throughout the entire period of radium usage it has been the poorly conceived or poorly executed procedure that has tended to discount, unreasonably, a very valuable agent.

With those of us who have been especially interested in radium it has been a matter of disappointment that it has not been able to contribute more in the field of breast cancer. It is true that cancer of the breast—a glandular type of cancer—follows a different clinical pattern than does the epidermoid carcinoma. However, trends again may be referred to as having an influence. The trend with breast cancer has always been strictly and traditionally surgical. The early Sampson Handley work with radium in connection with breast cancer surgery

was to be commended for its zeal but had little to offer in its execution. The Keynes work with radium in primary breast cancer ignored both the traumatic and the esthetic factors. Both of these efforts failed to utilize the necessary combination with x-radiation. It is unfortunate that this large and important group has never had a strong advocate for radiation, as have some of the other major cancer groups.

It goes without question that x-rays cover that entire routine of preoperative and post-operative breast irradiation. However, I am sure there is, here and there, a case in which radon may serve a useful purpose also in the primary growth, perhaps to the exclusion of surgical removal.

For a good while I have been interested in radon seed irradiation of the axilla in combination with x-radiation. In certain very early cases, and in some selected for other reasons, it has been possible to place the surgical scar low (a modified Stewart-type incision), save the pectoral muscles, and by implanting the under surface of the pectorals in the long axis of the axilla, after dissection, to double the intensity of irradiation in the axilla. I mention this as seemingly having some perhaps limited application in certain selected cases. The radium does step up the efficiency of irradiation of an area impossible to irradiate with complete satisfaction with x-rays as now used. It does it with safety. After all, that is the type of supplemental aid for which radium is really valuable.

In axillary operation for breast cancer, as well as for axillary involvement from other primary sources, it occurs not infrequently that the anatomic relationship and fixation make clean removal impossible. Under such circumstances, gold seeds of radon are very valuable and may turn failure to success.

The same general situation, in principle, is all too frequently encountered in surgical operations for malignant disease in various parts of the body. Radium, gold seeds of radon by preference, otherwise radium needles, should always be available for such emergencies. I do not imply that such an adjuvant will always turn failure to success. It does, however, offer the only real chance and is successful, in part or in entirety, with sufficient frequency to make it imperative operating table equipment. The surgeon is not justified in assuming the responsibilities of an operation for cancer, especially if there is the slightest question of extent of involvement, without having implantable radium available to help in meeting an emergency. The surgeon is not justified in assuming responsibility for such an operation unless he is capable of using radium intelligently and with technical competence. He is in a position comparable to that of the roentgen therapist to whom I referred previously, except that his responsibility is greater. The surgical situation is more apt to be an emergency—if the wound is closed without radiation the best chance for aid is lost.

It is obvious that the physician assuming responsibility for any phase of specific cancer therapy, x-ray or surgical, must be familiar with and have access to proper and adequate radium supply. It is usually only an adjuvant, but a very essential one.

In the bowel tract radium plays a very minor role—except in the rectum. I refer to this for a very definite reason. Radium is thought of too often in terms of advanced disease and palliation. What little of palliation is available to the rectal cancer victim—beyond a good colostomy—can usually be best done with x-rays. The early accessible rectal growth is the proper one for radium. Technically, this is best accomplished by prolonged irradiation, using either filtered implants or daily exposures of heavily filtered radium in the special protected Binkley applicators, or both.

I hesitate to refer to the bladder and prostate. In addition to being a painful area, the anatomic and technical problems are such that radium must be called upon with reluctance and caution, and only after the maximum possibilities and benefits of x-radiation and surgery have been utilized.

In contradistinction to this, cancer of the female pelvic organs always has been, and still is, the leading major group for radium therapy. The factors of relative growth response, accessibility, drainage, and pain are practically reversed from the bladder and prostate situation.

It is understood that external pelvic irradiation with x-rays is an integral part of today's routine therapy for uterine cancer. This, however, does not detract in the least from the radium usage as of the time preceding good efficient x-ray therapy. There is, of course, some shifting in the extent to which implantation is carried out in the cervix or paracervical zone. Radon implants are used less, but still used. Some types of special needles, such as those of Pitts, are a real advance. Radium has in no sense been supplanted or replaced by intravaginal x-radiation through cones. I mention this procedure only for the purpose of condemning it. There is no excuse for attempting to replace accurate, efficient irradiation with radium by such an inaccurate, uncertain, and esthetically unacceptable procedure.

During the past few years radium has come to occupy a stronger position in cancer of the uterine fundus. The results are adequate proof

jection of not being able to visualize the area of involvement for accurate radium placement has been met in part by Heymann's method of filling the cavity of the fundus with multiple tubes of radium. This reduces the objection but does not eliminate it. Hence, those who follow the irradiation by hysterectomy are in a sound position, providing the case be a favorable surgical risk-another example of coordinate use of all agents and methods.

Another procedure involving radon implants and not used, in my judgment, either early or often enough should be called to your attention. I refer to surgical pelvic exploration following routine irradiation-usually for carcinoma of cervix—where the question of a metastatic node is under consideration. We know that it cannot be reached with accuracy or safety through the vaginal vault. We know that the distance irradiation will not control it. Exploration and direct implantation affords a means of efficient and accurate treatment exactly comparable to the implantation of an epidermoid carcinoma node in the neck or in the inguinal area. The abdominal incision is a small consideration when dealing with a vital determining factor in a lethal disease.

This same problem of coordinating the advantages of x-radiation, surgery-radical or for exposure or drainage only-and radium in some

of the value of the procedure. The earlier ob- -form-usually radon seeds-is so important that it can scarcely be overemphasized. I continue to repeat it at the risk of appearing tedious. The radium in the combination plays a lesser role but it is a peculiarly vital role. It is a part that cannot be handled otherwise and yet it is a part that done alone would but rarely succeed, on its own.

> It is for this reason that a thorough all-round knowledge is essential on the part of the cancer clinician, whether he be therapeutic radiologist or cancer surgeon. It is for this reason that radium facilities should and must be as efficient and as readily accessible throughout the country as are facilities for x-ray therapy. It is for this reason that those in charge of therapy by irradiation must be as well trained in radium therapy as they are in x-ray therapy. And it is for this reason also that the cancer surgeon must be adequately and equally familiar with both.

> Our cancer treating facilities at this present time are far from ideal. They are, however, better than they were twenty-five, or ten, or five years ago. The small percentage of gain which accrues from taking full advantage of each facility or aid makes the ultimate result just that much better, and makes it a bit easier to do a better job for the next patient.

#### HEALTH PROGRAM EXTENDED IN AMAZON, RIO DOCE VALLEYS

Health and sanitation work in the Amazon and Rio Doce Valleys of Brazil, which are being developed as sources of strategic materials, will be extended under a five-year agreement just made between Brazil and the United States.

The new Brazilian-United States agreement broadens the scope of the cooperative work by these countries under the great inter-American health and sanitation program growing out of the Rio de Jan-eiro Conference of American Foreign Ministers.

The new agreement calls for a joint fund of \$8,000,000 to carry on health and sanitation projects in the Amazon and Rio Doce Valleys in support of the economic development going on there. The Amazon is the source of rubber and other forest products: the Rio Doce Valley is one of the world's greatest sources of minerals, including huge iron ore deposits. They are supplying essential materials for

United Nations war industry.

Brazil has agreed to contribute \$5,000,000 to the joint fund for continuation of the work over a five-year period. The United States contributes \$3,000,-000, through the Institute of Inter-American Affairs, an agency of the Office of the Coordinator of Inter-American Affairs.

These funds will enable the organization built up

in the last two years for the Amazon and Rio Doce work to carry on numerous projects for malaria con-trol, building of hospitals, health centers, and dis-pensaries, and the training of nurses and other per-Railroad centers, airports, river shipping points, and other strategic areas are expected to benefit from malaria control and new health facilities to prevent the spread of disease. As the crossroads for heavy wartime air traffic to and from Africa and other transatlantic destinations, northern Brazil has special need for additional health facilities.

About fifty United States doctors, engineers, and other specialists are working with some 2,500 Brazilians in the Amazon and Rio Doce campaigns against disease.

In the Amazon the job includes the distribution of antimalarial medicines from infirmaries, medical posts, and dispensaries. Other phases of the Amazon work include the establishment of mosquito control posts at main points of supply and drainage of malaria swamps around large communities.

In the Rio Doce area the projects embrace construction of water supply and sewage systems and the installation of drainage ditches and other sanitation facilities.—Release from the Office of the Coordinator of Inter-American Affairs

#### THE MANAGEMENT OF CARCINOMA OF THE CORPUS UTERI

James A. Corscaden, M.D., New York City

TMPROVEMENT in the results following treatment for carcinoma of the corpus uteri will depend primarily, as in most other cancers, upon the shortening of the interval between the appearance of the first symptom and the time when therapy is instituted. The most important factor in this delay is the still prevalent fear that all cancers are incurable. Shortening the delay will depend upon our ability to convince the general public and many physicians that some cancers, particularly those of the uterus, are readily cured if attacked early, and on increasing cancer-mindedness among physicians who will first see these patients. Of less, but still considerable, importance is improvement in the technic of radium and x-ray treatment applied either alone or as an adjunct to hysterectomy.

Despite the enormous amount of energy expended on cancer education, the lag between the appearance of the first symptom, usually vaginal bleeding, and the beginning of therapy is still discouragingly great. Of the 201 cases here studied (Table 1), one-third of the patients had symptoms for more than a year, and half of them for over six months prior to the first visit to a physician. While ignorance accounts for much of this delay, fear based on the notion that cancer is incurable seems to play a more important part. It is natural to believe that, since the disease is incurable, it is best to keep it out of one's mind by submerging what one has heard about the significance of vaginal bleeding and by rationalizing about the change of life or returning youth. Not only is this idea of incurability present in the minds of large numbers of the lay public, but it also colors the attitude of many physicians and other professional workers such as nurses. Frequently in our neoplasm clinic they exclaim that they did not know that so many people could be cured of cancer. Twenty-five per cent of a class of medical students entering their fourth year, believed that the cancer situation was quite hope-This is easily understandable. The cured cancer patient does not parade her good fortune; indeed, she will often continue to hide the fact that such a condition had existed: Only those working in a follow-up clinic will see a considerable number of such patients grouped together. On the other hand, the uncured patient will for many months remain an object of pity, of prolonged medical attention, and will often present symptoms which will accentuate the apprehension which all have toward cancer.

Improvement in this situation will only follow the realization by all—laymen and physicians that cancer of the uterus, when attacked early, can be eliminated or treated by radiation with great success. Only on this basis can there be aroused an aggressive attitude to take the place of the prevailing dread with its handmaidens of evasion and deception.

Delay due to diagnostic error is becoming less and less frequent although there is still considerable room for improvement. As indicated in Table 1, only half of the cases were treated immediately after being first seen by a physician. Improvement here will follow a greater cancermindedness among physicians, an insistence on early examination, and a wider practice of performing periodic examinations.

The principal cause of diagnostic error was overemphasis on the teaching that cancer of the corpus uteri is a disease of old women past the menopause. Patients in their late forties were treated as long as eight months by endocrines until finally the cancer was revealed by a diagnostic curettage. Since menstruation still continued and since the gynecologic examination ruled out cancer of the cervix, the possibility of cancer of the corpus was ignored.

Fig. 1 shows graphically the age incidence of carcinoma of the cervix and corpus uteri in patients admitted to Sloane Hospital. It is apparent that although the proportion of corpus cancers to cervix cancers increases with age, there are fewer cases of corpus carcinoma at all ages. On the other hand, it occurs at all the ages at which carcinoma of the cervix is found. The peak of the curve of the corpus carcinomas (50–55) is only five years later than that of the cervix (45–50). The inference is made that, while cancer of the corpus does occur more frequently in the later postmenopausal years, it must be kept in the diagnostic picture at all ages. Two of our patients were aged 27.

A less important factor is the taking of incomplete biopsies under the impression that the taking of a cervical biopsy is like collecting a specimen of blood or urine to be sent to the laboratory, with consequent neglect of an appraisal of the gross specimen and of an examination of the rest of the uterine canal. If bleeding be a symptom, specimens should be obtained from all sections of the uterus, preferably by the performance of a "fractional curettage," separate specimens being removed from the cervix, each horn of the uterus,

Read at the Annual Meeting of the Medical Society of the State of New York, Buffalo, May 5, 1943.

TABLE 1.—DELAT IN THE ADMINISTRATION OF THERAPY FOR CARCINOMA OF THE FUNDUS

	Over 1 Year	Over 6 Months	Over 2 Months	Over 1 Month	Under 1 1 Month	Total Number of Patients
From the first symptom to the first visit to a physician	69	38	45	18	20	190
From the first consultation to first visit to the therapist	1	6	24	23	50	104
From the first visit to therapist to treatment	0	3	6	8	102	119

It is clear that the greatest delay occurs before the patient first consults a physician. The patient is also responsible for most of the delay after this first consultation and to a less extent for the delay after visiting the therapist.

and the main uterine cavity. In the horn of the uterus a very small curette must be employed to catch the occasional small cancer located in such a way that it would be missed by a large curette. We have no experience with the suction biopsy in these cases. This technic is satisfactory for the obtaining of bits of the endometrium for physiologic study, but a specimen so removed, for the diagnosis of carcinoma, if negative, does not exclude the presence of carcinoma and should be ignored.

#### Treatment of Cancer of the Corpus

The present status of the treatment of cancer of the corpus is indicated in Table 2. Of the three principal methods, hysterectomy is the oldest and still the most widely employed. Candidates for the National Board certificate give it most often as the accepted treatment of cancer of the corpus,

AGE INCIDENCE - CARCINOMA - "" UTERUS

implying that in the institutions at which they obtained their education this was the method taught. Satisfaction with this form of treatment stems from the great difference, in the early days, between the results of hysterectomy for cancer of the cervix and that following hysterectomy for cancer of the corpus. Practically all patients with carcinoma of the cervix died, whereas a respectable portion of those operated upon for carcinoma of the corpus (47–55 per cent) survived. The difference, unfortunately, gave rise to the general impression that the operation gave completely satisfactory results.

Radiation, employed early in the century, at first gave variable results and was attended by many injuries. Early experimental work<sup>1</sup> which seemed to show that adenomatous neoplasms were relatively resistant to radiation also further supported the general statement that cancer of the cervix was best treated by radiation but cancer of the corpus by hysterectomy.

However, occasional patients who, because of senility, obesity, or disease were poor operative risks and others with extensive carcinoma were of necessity given radium. Also a few therapists, notably Heyman,<sup>2</sup> devoted concentrated effort to radium technic. As a result there is a considerable amount of material from which to judge the results of radium treatment. In Table 2 these results are impressive. While in the main not so good as those following hysterectomy, they, especially in recent years, approach them, and, in occasional reports, surpass them. They are good enough to require that operation should be performed only in patients who are good surgical risks.

Naturally, a combination of the two methods was soon attempted. While the number of cases so treated is still relatively small, nevertheless it is apparent that the combination of radiation and operation gives the best results (75 per cent). Examination of 60 uteri treated by radium and removed later (Table 3) shows that in 25 per cent the growth had been completely destroyed but that in 75 per cent the destruction was incomplete, indicating the necessity for removal of the organ, although 73 per cent of the cancers were profoundly affected by the radium. The most notable effect was the intense superficial cauteri-

‡ There were 2 postoperative deaths. One patient died of carcinoma after four years.

zation. This may explain the absence of recurrences in the vaginal and abdominal wounds in patients treated by the combined method, a complication which occurred frequently in the patients unsuccessfully treated by complete hysterectomy alone.

An evaluation of the effect of roentgen rays is difficult. The patients who received postoperative radiation are often intermingled with those treated by hysterectomy alone. Given preoperatively in addition to preoperative radium it has, according to Healy, Arneson, and Schmitz, Preoperative x-ray withimproved the results. out radium has been employed by Miller<sup>6</sup> with Wintz, employing x-ray satisfactory results. alone, reports a five-year survival of 69.1 per cent of 127 operable cases and 17.9 per cent of 134 cases of inoperable carcinoma. These results have not been duplicated by others, and Gilbert and Solomon8 have never seen a cure of a case of carcinoma of the corpus treated by x-ray alone. Merritt9 states that "radiation alone cannot be relied upon for the treatment of corpus cases."

Two of our patients give evidence of the effectiveness of x-ray.

Case 1.—One was a woman suffering from an extensive carcinoma of the pelvis originating in the corpus. At the curettage, excavations in the wall of the uterus were found so deep and so near the rectal mucosa that it was deemed unsafe to introduce radium. Between May 16 and October 1, 1939, this

patient was given in 54 treatments through one anterior, one posterior, and one perineal field, a total of 10,200 r with 700 kv., 70 and 146 cm. target skin distance and a filter of 4.6 mm. Pb and 2.5 mm. Cu or 0.5 mm. Pb and 0.5 mm. Cu. The para-The uterus regained its normal metria cleared. contour. At a second curettage two years later the uterine cavity was nearly symmetrical but contained residual carcinoma. Following the intrauterine application of 50 mg. of rodium for sixty hours, the patient has survived, with evidence of rectal injury. There are today (four and a half years later) no pelvic symptoms except a mild diarrhea. There is rigidity of the pelvic tissues without induration. Carcinoma possibly persists.

Case 2.—The second patient, on September 25, 1939, had a complete abdominal hysterectomy for a wild anaplastic tumor involving both tubes, ovaries, and the cervix. In November, 1939, there was a recurrence of the growth in the abdominal wound. Given x-ray treatment (200 kv., 2 mm. Cu filtration, T. S. D. 50 cm., four posterior fields 10 × 15 and two anterior fields 10 × 15 cm.—total 9,800 r), the

Extensive (3)		

Small—area 1 sq. cm. or less. Large—area up to 4 sq. cm. Extensive—involving most of endometrial cavity. mass disappeared. Today (four years later) there is no evidence of carcinoma.

Further evidence of the efficacy of x-ray is furnished by 21 cases of supravaginal hysterectomy for carcinoma of the corpus. Of 14 cases treated by x-ray, 6 survived five years, while of 7 cases not so treated only one survived. On the other hand Healy³ found residual carcinoma in all of 6 patients operated upon after x-ray therapy, and Miller⁵ states that in many cases similarly treated carcinoma persisted. The general conclusion is that there is a definite specific effect of the x-ray upon certain carcinomas of the corpus but that this action is incomplete and should be supplemented by other therapy.

# Improvement in the Management of Carcinoma of the Corpus

The most important advance in the treatment of carcinoma of the corpus will be in the concentration of attention and effort on cancer either by an individual or by an organized group prepared and alert for new methods, skilled in operative technic and in the application of radium and x-ray, and willing to conduct follow-up examination over a long period of time. With this established, improvement in all phases of the management of cancer will quickly follow.

The form of the organization may be that of a cancer clinic separate from the other services, or of a special group within the gynecologic service and working in intimate cooperation with the department of radiology and other groups having to do with the management of cancer. This type of organization is particularly successful in the management of carcinoma of the corpus, the principal symptom of which is irregular bleeding and the physical signs of which are negligible. These patients apply more naturally to the gynecologic clinic than to one limited to the treatment of cancer.

An example of improvement following this type of organization is found at the Sloane Hospital, where such an organization was established in 1930. Before that time the five-year results from the application of radium alone gave a "cure rate" of 16 per cent while that from 1931 to 1937 was 39 per cent. Similarly in the operable cases the percentage of five-year survivals before 1931 was 48 per cent and in 1931–1937 it was 70.9 per cent. Not all cases are treated by the neoplasm group but receive the benefit of information and advice.

The most efficient plan of treatment has not been determined. The evidence is fragmentary and difficult to appraise because of variations in clinical classification, in standards of five-year appraisal of the cases, and in technic. It seems apparent, however, that the intense caustic ef-

fect of intrauterine radium is of considerable benefit and that radiation has a selective action on many carcinomas, but that both of these effects are incomplete so that hysterectomy in addition is required. X-ray and radium applied before hysterectomy insure the early exposure of possible carcinomatous foci outside of the uterus and may insure a greater destruction of cancer at the time of the operation. We have employed radium followed by operation and then by x-ray because intensive x-ray treatment has seemed to make the operation somewhat more difficult and because carcinomas which had extended beyond the uterus at the time of the operation had in most cases already metastasized to distant areas. This phase of the work is in a fluid state and requires more study. treating small numbers of corpus carcinomas should follow a definite technic and should report these cases so that they may be grouped together with others which have received the same treatment.

Improvement in hysterectomy will be slight since the principles of the technic have been well standardized for several years. The major improvement will be in the care of the patient, with a resultant lowering of the operating risk, and in increasing the skill of the individual surgeon. This may be accomplished by the performing of more frequent complete hysterectomies for benign conditions, a practice which is finding increasing favor.

Improvement in radium dosage is greatly needed. Surgeons using radium only occasionally are likely to employ doses which are too small. Healy and Brown<sup>3</sup> report 93 cases treated by large and small doses of radium and later operated upon, with a five-year salvage of 55 per cent while 28 cases similarly treated by doses of over 3,000 mg. hours had a five-year survival rate of 75 per cent. Preoperatively, at the present time, from 3,000 to 4,000 mg. hours of radium with 0.5 to 1.5 mm. Pt filtration may be given with safety. An operation performed five to six weeks later will be attended by no difficulties. Full doses of from 5,000 to 6,000 mg. hours are permissible when the radium is spread out within the uterine cavity and when the bulk of the uterus is considerable. If the uterine walls are thin, the dose will have to be lessened. Otherwise intestinal injuries are likely to follow. Operations performed after doses of this order will be made somewhat difficult by oozing from the congested tissue and later by scar formation. Whether to use a large amount of radium, say 200 mg. for a short time, or smaller amounts, say 50 mg. for a long time, is still a matter of doubt. There is apparently a slightly better effect on the carcinoma by the latter method and certainly a low-

TABLE 4.—CARCINOMA OF THE CORPUS UTERI (Table adapted from Heyman's to show the improvement in four-year results coincident with the adoption of the "packing" technic)

ering of the incidence of intestinal and bladder injuries.

The distribution of radium in and about the uterus is an essential part of the technic. Sampson<sup>10</sup> showed that it was difficult to place accurately a radium applicator in the normal and especially in a distorted uterine cavity. Most therapists, however, continue to use the tandem form of applicator with generally good clinical results which, however, are probably somewhat inferior to those following the technic described below.

Examination of specimens removed several weeks after treatment by radium in the tandem type of applicator shows incomplete destruction of cancer. Of 46 cases reported by Donovan,11 5 were free of cancer. Of 27 cases reported by Farrar<sup>12</sup> 6 were free of cancer. Healy<sup>3</sup> reports complete destruction of the carcinoma in 3 of 24 cases treated by doses of 1,200-2,700 mg. hours; in 13 of 25 cases treated by 3,000-3,300 mg. hours; and in 12 of 20 cases treated by 3,400-4,000 mg. hours. In our own cases it will be seen in Table 3 that in 15 out of 60 specimens the carcinoma had been destroyed and that in 22 there was only a small shallow residuum. There was in all specimens an intense superficial caustic effect but great variation in this action in different portions of the cavity, some areas being greatly affected and others almost not at all. All uteri receiving less than 2,000 mg. hours showed persistent carcinoma. Otherwise there was no correlation between the radium dose and the degree of destruction of the carcinoma. Two technics were employed; one was the use of a simple tandem and the other the introduction of separate radium units on the end of spring wires designed to place the individual applicators about one centimeter apart. X-ray photographs of these applicators showed, however, that they did not remain in the locations planned but became in effect broad

single applicators. Packing the uterus with small units of radium has brought about, in the hands of Heyman2 a

great improvement in clinical results, as indicated in Table 4. Prior to 1931 a tandem technic was used in most cases and from 1931 to 1935 the uterus was packed with multiple small units of radium.

It will be seen that there is a 50 per cent improvement in the operable cases and one of 140 per cent in those which were inoperable. It is true that other factors are involved but they are overshadowed by the great improvement which coincided with the change in technic. (1932-1933, 46 operable cases with 54 per cent fouryear survival; 1934, 26 cases, 69.2 per cent; and 1935, 22 cases, 72.7 per cent.) Crossen,13 Arneson, Martin, 4 and Cuscaden and Oddie 15 have used other technics for the same purpose, but the number of cases is as yet too small for generalization.

Mechanical devices to serve the same purpose have been devised by Schmitz,16 Friedman,17 and Strauss, 18 with apparent improvement in results but in numbers again too small for appraisal. We conclude, then, that radium, whether by packing or some mechanical device, must be distributed evenly throughout the uterine cavity to obtain maximum results.

The use of radium in the vagina in cancers of the corpus is of doubtful importance, since the lymphatics from the corpus follow the ovarian vessels. If the neoplasm has invaded the cervix, it presents a different problem and probably should be treated in much the same fashion as is a cancer originating in the cervical canal, in which case radiation alone would be employed without the subsequent hysterectomy.

Improvement in x-ray technic will depend on the employment of higher voltages. dence of superiority of the higher voltage is somewhat scant but encouraging.16 Since the war effort has absorbed the output of manufacturers of these high-powered machines, we must with a few exceptions be content with the maximum to be obtained from the 200-kv. machines.

#### Conclusions

The most important factor in improving the results of treatment for carcinoma of the corpus will be the shortening of the interval between the appearance of the first symptom and the administration of treatment.

The major cause for this delay is the still preva-

lent idea that all cancer is incurable.

Laymen and physicians must be convinced

that at least 75 per cent of patients suffering from carcinoma of the corpus can be cured.

While cancer of the corpus occurs more frequently after the menopause, it must be looked for at any age.

The best treatment for carcinoma of the corpus is a combination of radium, x-ray, and operation. The principles underlying the operation of complete hysterectomy are standardized. The greatest room for improvement lies in the technic of radium application and in the selection of the order in which the three therapies shall be given.

#### MONTE CASSINO-CRADLE OF WESTERN MEDICINE

Salerno is one of the very few places in the Roman Empire where lingered traces of the arts and sciences of antiquity. We commemorated it as the seat of the first medical school in our issue of September 25 last, when it was occupied by the Allies. . .

The vast monastery on the mountain that overlooks the town has been a centre of learning from its very foundation... here the medical Dark Ages showed a spark of the new spirit. If Salerno connects the Dark Ages with the remote classical past, Monte Cassino represents the dawn of modern times....

In the eleventh century, the greatest period of Monte Cassino, the relations between the civiliza-tions of East and West were the very reverse of those we now know. In our time we have seen Orientals accord to our civilization the sincerest form of flattery. Things were very different then. West knew well that not only military might but also science and learning lay with Islam. Oriental efficiency in arms, in administration, in commerce, as well as in the sciences and arts, had been more than sufficiently proved. The impression that they made on their Western contemporaries is still enshrined in our language in such Semitic words as arsenal, admiral, tariff, algebra, almanac, theodolite, damask, and a hundred others. Not a few of these Semitic terms are medical. . . . anatomical terms such as the names of the basilic, cephalic, and saphenous veins, and, of course, the names of many drugs. The first to convey to the West the substance of knowledge on which Arabic influence was based was one Constantine. He was born about 1020 . . . it is probable that he was a native of Sicily. He acquired his medical knowledge in Jewish circles at Kairouan in Tunisia. Constantine returned about 1072 to Sicily, then passing into Norman possession. There he came in contact with Robert Guiscard. In 1076 Salerno fell to the Normans and became the capital of a Norman principality under Robert. Constantine seems to have arrived at Salerno in his suite and to have acted as his secretary for Oriental languages. Having become a Christian, he retired about 1080 as a monk

to Monte Cassino. There he spent his last years, translating Arabic medical works into Latin. He died in 1087. In the eleventh century the works of the ancient Greek physicians had long been lost in the West. Arabic translations of these existed, as did many works in Arabic based primarily upon them. The knowledge of these was, however, confined to those who could read that language; in other words, so far as the West was concerned, exclusively to Jews. The Arabic superstructure on Greek medicine had profoundly affected the whole outlook of the world of Islam. The advent of Latin translations of these Arabic works caused a similar stirring of the spirit in the West. Thus the writings of Constantine, being the very first of their kind, are of peculiar interest. They consist entirely of translations of Arabic-speaking physicians. Among them were several works of the centenarian, Isaac the Jew (855-955), the great physician of Kairouan. They include his work on fevers, the best of its kind for many centuries, another on diet, and a third on urines, as well as certain of his philosophical writings. There were also works of Isaac', pupel, another down of Kairouan, ibn al-Djezzar (92), 10 c'e, inchalant his Viaticum peregrinantis, a very popular guide to travellers on the care of health. Very important was a version of an extensive work by the Persian Magian, Ali ibn Abbas (died 994), which, oddly enough, was also circulated in the name of Isaac. These works and others of the like kind provided a vocabulary of technical terms, the remains of which can still be traced in our medical nomenclature.

Despite the vicissitudes of the great monastery, there still remain in the library some fourteen hundred manuscripts of great antiquity. A considerable number of these are medical and of the time of Constantine himself. Some are of yet earlier centuries. There is also evidence . . . . that some Anglo-Saxon medical texts that are of the time of the Norman Conquest were prepared at Monte Cassino . . . we rejoice to learn that these most precious documents were long ago removed to a place of safety .- British Medical Journal, Feb.

19, 1944

# CRUDE LIVER EXTRACT AS AN AID TO ARSENO. AND HEAVY-METAL THERAPY

GIRSCH D. ASTRACHAN, M.D., New York City

THIS study includes data on further experiences with the value of crude liver extract\* as a supportive measure in the treatment of patients with histories of previous intolerance to arsenicals or heavy metal, and patients presenting other difficult therapeutic problems. It also includes data on the prophylactic and therapeutic values of liver extract in patients who are intolerant to these drugs, the influence of liver extract on the icterus indices, and untoward reactions due to liver extract injections.

One hundred and fourteen patients were studied. There were 60 patients from the Skin and Cancer Unit of the New York Post-Graduate Medical School and Hospital (service of Dr. Fred Wise), 33 patients from the Metropolitan Hospital and Dispensary (service of Dr. Van Alstyne Cornell). One patient was referred by Dr. Loewenstein and 20 patients were from the author's private practice. Sixty-four patients were females, 50 males. The oldest patient was 62 years of age, the youngest was 7 months.

# Use of Liver as a Supportive Measure in Cases Presenting Difficult Therapeutic Problems (see Table 1)

Among the patients there were 52 presenting some complicating therapeutic problem. most of them no intolerance to any drug could be established at the time. However, because of some systemic disturbances or skin eruptions, or because of histories of previous intolerance to drugs, these patients presented difficult treatment problems. To forestall serious complications, it was decided to administer the drug in question (arsenic or heavy metal), preceded each time by an injection of liver extract.

The results in most of the cases were very gratifying. In 47 cases the drug in question was tolerated and the patients felt very well during the treatment.

Read at the Annual Meeting of the Medical Society of the

State of New York, Buffalo, May 5, 1943.
From the Skin and Cancer Unit, New York Post-Graduate Medical School and Hospital, Columbia University, and Metropolitan Hospital and Dispensary, Welfare Island, New York City.

I wish to express my deep appreciation to Miss Marjorie Mattice for her very fine cooperation in the icterus index study, and to Dr. E. A. Sharp for his valuable information.

I also want to thank Dr. Ludwig Loewenstein for allowing me to include his case in this study, and Dr. Leo Leibovitz for his help in looking up records at the Metropolitan Hospi-

\* Parke, Davis and Company crude liver extract (1/2-1 U.S.P. unit per cubic centimeter) was used in this investigation.

Seven patients gave a history of a previous intolerance to arsenicals (pruritus, dermatitis, urticaria, erythematous and scaly eruption, gastrointestinal disturbances, etc.). No aftereffects developed when an arsenical (2 cases) or bismuth (4 cases) was administered concurrently with liver extract.

Nine cases presented some form of skin eruption such as moderate or severe pruritus, urticaria, seborrheic dermatitis, or erythematous and scaly eruptions. (These eruptions were not related in any way to any intolerance to arsenicals or heavy metals.) All these patients tolerated the arsenicals given concurrently with liver extract.

One case is interesting enough to be cited:

Case 1.—Baby B. had congenital syphilis. The patient was treated with bismuth and mapharsen given in alternate courses. At the age of 4 months the baby developed a generalized vesicular, papular, and pustular eruption following 7 injections of mapharsen. In spite of the fact that the eruption was not considered to be due to mapharsen therapy, mapharsen was discontinued and renewed three months later after a preparatory course of 8 liver injections (1/4-2 cc.) given twice weekly. At that time each injection of mapharsen was preceded by an injection of 2 cc. of liver extract. Mapharsen was well tolerated. The baby, who had not gained weight and at the age of 7 months weighed only 8 pounds 10 ounces, started to gain very rapidly when mapharsen was added to the liver therapy.

Eight of the patients were either elderly people with frail constitutions or patients presenting tabes dorsalis with severe degenerative complications, or those with pulmonary tuberculosis, or younger patients with signs or symptoms of moderate dyscrasia of the hemopoietic system, or those suffering from general weakness, low resistance, malnutrition, and underweight. All these complications presented indications for supportive injections of liver extract.

The patients responded favorably to the therapy. They gained in weight and strength, and all tolerated the arsenicals or heavy metal very well.

Twenty-five cases presented elevated icterus indices (7.9-21.4). Following the injections of arsenicals (13 cases) or heavy metal (12 cases) given concurrently with crude liver extract, the icterus indices decreased in 15 cases, became higher in 5 cases, and remained unchanged in 2 cases; in 3 cases the icterus indices decreased only after a course of liver injections were given. Only in 5 cases out of 25 was the arsenical or heavy metal discontinued because of the increased icterus indices.

Five cases of lupus erythematosus were treated with bismuth supported by liver extract because of

TABLE I —Use of Liver as a Supportive Measure in Cases Presenting Difficult Therapeutic Problems

the patients' anemia or high interus indices or general weakness. The results were good Two cases of leukopenia (white blood cells, 4,200 and 4,850) were observed. The patients felt well and the leukopenia improved somewhat following the injection of the arsenical or bismuth. In one case, however, the arsenical had to be discontinued because of the slight aggravation of the concomitant anemia. Two cases of hepatitis were observed. In both, the supportive liver therapy was of great help. One case is important enough to be cited:

Case 2.—C. S., a man aged 56, presented late syphilis of the tongue, asymptomatic neurosyphilis,

hypertension, and hepatitis. Because of the involvement of the cerebrospinal fluid, it was considered advisable to use an arsenical regardless of the hepatitis. Mapharsen was instituted in dosages from 5-40 mg, concurrently with liver extract. The patient felt very well during treatment. The pain in the right side of the abdomen became less pronounced. Following 13 mapharsen and 13 liver extract injections, the icterus index remained normal (5-5-4). The blood count was found to be normal. The patient felt well while receiving 30 mg. of mapharsen; however, when the dosage reached 40 mg. he began to feel weak; the dosage had to be reduced to 30 mg. He is still under treatment.

# Value of Liver in the Prevention of Manifestations of Intolerance to Arsenicals and Heavy Metal (see Table 2)

The prophylactic value of liver extract injections in cases intolerant to arsenicals and heavy metal was studied by various investigators. <sup>1-6</sup> I became interested in this problem at Sulzberger's suggestion in 1936, and since then all forms of intolerance to arsenicals and heavy metal have been observed. The results of these studies were reported. <sup>8,9</sup> According to Wise and Sulzberger, <sup>10</sup> "both liver injections and administration of large doses of vitamin C now seem worthy of trial in attempts to prevent unpleasant or dangerous allergic sequelae from arsenicals in patients who absolutely require the continuation of intensive antisyphilitic therapy." Recently Chamelin and

Funk<sup>11</sup> reported that simultaneous administration, to animals, of liver extract with sulfanilamide or diethylstilbestrol diminishes the toxicity of the latter two drugs.

In the present investigation 38 cases of intolerance to arsenicals and heavy metal were studied. These patients underwent a physical examination, including a complete blood count, icterus index, and urine tests, as soon as the characteristic manifestations of intolerance were noticed. The next step and the method of using liver as a prophylactic measure depended on the laboratory findings, the kind and form of intolerance, and the general condition of the patient.

Two methods of liver therapy were used. In one group, (22 cases) as soon as the condition of the patient permitted it, the injection of the offending drug in the same or smaller dosage, was repeated the following week or later. Fifteen minutes before this an injection of liver extract (1/2-5 cc.) was given. If the symptoms of intolerance reappeared after this treatment and were as pronounced as previously, the drug in question was dropped completely or discontinued temporarily. If the symptoms of intolerance were ameliorated or absent after this treatment the offending drug (in increased dosage) was readministered the next week, preceded by a liver extract injection. In this manner a full course of the drug would be given (dosage gradually increased until the regular dosage was reached), preceded each time by an injection of liver extract.

The second group (16 cases) included patients in whom the first method of administration of liver injections did not prevent or ameliorate the patients' intolerance to the drug, or those patients in whom the manifestations of intolerance were so important that the offending drug was discontinued temporarily, and a preparatory course of liver extract injections (average about 10 injections) instituted; the injections were given once or twice a week. On completion of this course, the offending drug was readministered and given in the same way as in the first group, each time preceded by a liver extract injection. In some cases additional liver injections were given once or twice weekly.

The results of the investigation of the prophylactic value of liver extract are given in Tables 2, 3, 4, and 5.

I used the term "improved" and "some improvement" in the same way as in the previous investigation. "Improved" cases were those in which the intolerance disappeared or was ameliorated sufficiently to allow me to continue the use of the offending drug in the same or even in gradually increased dosages. "Some improve-

ment" meant the changes either in those cases in which the intolerance was ameliorated very slightly or in those cases in which the amelioration of the intolerance lasted only a short time. The patient then became sensitive again to the offending drug.

Various forms of intolerance were observed (see Table 2).

Gastrointestinal Disturbances.—This group included 25 cases which developed immediately or within twenty-four hours, one or a combination of several of the following symptoms, fever (lasting for several to twenty-four hours), headache, dizziness, nausea, vomiting, weakness, numbness, diarrhea, high icterus index. Patients in this group showed a definite improvement in 15 out of 25 cases (60 per cent).

The following case is reported as an illustration:

Case 3.-Mrs. L. W., aged 36, was referred by Dr. Loewenstein with the history of chills and high fever (103 F.) following each injection of mapharsen (dosage 18-25 mg.). After the complete blood count, icterus index, and urine were found to be normal, mapharsen was readministered (dosage 6 mg.), preceded by 2 liver extract injections (1-2 cc.). The patient developed a slight fever the same day. Mapharsen was discontinued and a preparatory course of liver extract given (6 injections 2-4 cc., twice a week). Following that, mapharsen (6 mg.) was renewed, preceded by 4 cc. of liver extract; no aftereffects developed. After that mapharsen in gradually increased dosages (weekly increase 4 mg.) was given every week for ten weeks. The maximum dosage of mapharsen reached was 371/2 mg. The injection of mapharsen was preceded each time by an injection of 4 cc. of liver extract: an additional liver extract injection was given every

The patient tolerated all the injections of mapharsen well, and developed a slight reaction (weakness) only when the dosage of mapharsen reached 37½ mg. According to Dr. Loewenstein, 12 the patient received several courses of mapharsen after that, accompanied by liver extract without any aftereffects.

It is noteworthy that the only 2 cases of diarrhea in this group were not prevented by liver extract injections.

Nitritoid Crises.—One case was observed. The patient developed a nitritoid reaction in December, 1940, following an injection of 2 mg. of tryparsamide. In March, 1943, in spite of the prophylactic liver therapy, the patient developed another nitritoid reaction following an injection of 1.5 mg. of tryparsamide.

Pains in the Bones and Joints.—One case was observed; a general aching in the bones and joints developed following an injection of bismuth salicylate in oil. The same reaction occurred in spite of a preceding liver extract injection.

Pruritus Without Visible Skin Manifestations.— Seven cases were observed (5 treated with arsenicals, 2 with bismuth). Additional liver extract injections were given in one case only. Two cases improved. There was a slight amelioration of the symptoms in two other cases. Three cases did not show any improvement whatever.

Localized Erythema With or Without Scaling or Urticaria.—Four cases were studied (3 treated with mapharsen, one with mapharsen and bismuth). The eruptions were very mild in character. In one case the prophylactic injections of liver extract did not produce any changes in the patients' hypersensitivity to the arsenical. Some improvement could be noticed in the second case. In two other cases the results could be classified as "improved." One of the cases merits citation:

Case 4.-F. C., a woman aged 28, had early syphilis. Following an injection of 15 mg. of mapharsen, the patient developed "stiffness and swelling of the knees and elbows; she could not bend her fingers. She felt very weak, her heart was pounding and she could not catch her breath." Mapharsen was discontinued and bismuth instituted. After the fourth injection of bismuth, the patient developed an urticarial eruption. The next week bismuth was readministered, preceded by liver extract. Urticaria did not reappear. Eight weeks after the reaction to mapharsen, after the patient had received 10 liver extract injections (given concurrently with bismuth), mapharsen was readministered (5-30 mg. in gradually ascending dosages), preceded by liver extract; no reaction occurred. Altogether the patient received 52 mapharsen and 47 bismuth injections (preceded by liver) without any aftereffects.

In this series it is difficult to interpret the exact relationship between the liver injections and the changes in the hypersensitivity to the arsenicals. It is undoubtedly possible that these changes occurred spontaneously and were only coincidental with the liver administration. However, the time factors also have to be considered and these (five weeks' average) speak somewhat in favor of the beneficial effect of liver therapy.

## Relationship of the Methods of Administration of Liver to the Results Obtained in the Prevention of Intolerance to Arsenicals and Heavy Metals (see Table 3)

In all the cases in which liver was used as a prophylactic measure, the liver injections were given about fifteen minutes before the injection of the arsenical or heavy metal. In 16 cases, however, the patients received additional liver injections in the form of a preparatory course given prior to the renewal of the offending drug, or in the form of additional liver injections given

TABLE 3.—Relationship of the Method of Administration of Liver to the Results Obtained in the Prevention of Manifestations of Intolerance to Arsenicals and Heavy Metals

,	Preceded by Liver Extract Each Time	Preceded by Liver Extract Each Time and Additional Liver Given

once or twice a week. There were more improved cases among these 16 (56 per cent) than among those which did not receive additional liver injections (45 per cent). On the other hand, there were fewer unimproved cases in the first group (25 per cent) than in the second group (36 per cent). In one patient, Mrs. W. L., after the mapharsen was readministered preceded by a liver injection, the results obtained showed "some improvement" only. However, after the patient received a preparatory course of liver extract (8 injections) and additional liver injections once a week, the results obtained were very good; the patient could tolerate the mapharsen well.

# Relationship of the Readministered Dosage to the Results Obtained in the Prevention of Intolerance to Arsenicals and Heavy Metals {see Table 4}

In 13 cases it was considered safer to readminister the offending drug with a smaller dosage at the start, and gradually increase the dosage until it was as large as or even larger than that at which signs of intolerance had previously appeared. The percentage of unimproved cases was smaller in this group (8 per cent) than among those (44 per cent) in which the read-

ministered dosage was the same as that which had been previously followed by signs or symptoms of intolerance.

# The "Time Factor" [see Table 5]

By this term is understood the period of time which elapsed from the moment the symptoms of intolerance appeared to the moment the same arsenical was readministered, supported by liver injections (provided the manifestations of intolerance had subsided sufficiently to permit the readministration of the arsenical). The study of the relationship between the "time factor" and the apparent diminution of intolerance in cases following the administration of liver therapy was warranted by the well-known fact that hypersensitivity in any case and to any drug may spontaneously decrease and even disappear entirely as time passes.

The smallest percentage of improved cases (47 per cent) was seen in the first group with the shortest "time factor" (one to two weeks). The largest percentage of improved cases (54 per cent) was among those in which the time factor was three to ten weeks (see Table 4).

Quite unexpectedly, the percentage of improved cases in the third group, with the longest time factor (more than ten weeks), was smaller (50 per cent) than in the second group. These paradoxic results could possibly be explained by the fact that 4 out of 6 cases in this group were cases of skin manifestations or nitritoid reactions, conditions which responded to the prophylactic injections of liver extract less readily than cases with gastrointestinal reactions.

# Value of Liver Extract in the Treatment of Existing Manifestations Due to Intolerance to Arsenicals or Heavy Metal [see Table 6]

This problem was thoroughly investigated by Spiethof, <sup>13,14</sup> Milbrodt, <sup>15</sup> Fulst and Fellner, <sup>16</sup> and others, <sup>17,18</sup> and they found liver extract injections of great help in the amelioration of symptoms of arsphenamine-toxic cases. Stokes <sup>19</sup> also advises the use of liver extract in arsphenamine dermatitis. Abramowitz <sup>20</sup> states that he has used crude liver extract for the management of

eruptions from various drugs and he has found it more beneficial than other methods of treatment. Gross<sup>21</sup> suggests "that certain types of arsphenamine dermatitis respond particularly well to liver therapy because they represent instances of vitamin B complex deficiency, caused by the direct effect of the drug on specific functions of the liver." Epstein, <sup>22</sup> on the other hand, prefers 10 per cent dextrose to liver extract injections in cases of postarsphenamine exfoliative dermatitis. From previous investigations, <sup>8,9</sup> the impression was gained that liver extract is a useful therapeutic agent in some patients suffering from manifestations due to intolerance to arsenicals and heavy metals.

In the present investigation, liver extract as a therapeutic agent was used in 26 cases (see Table 6). Some patients began to have liver injections soon after the aftereffects appeared. Others began to receive liver therapy only after other methods of treatment failed. The injections of liver extract were given one to three times weekly. The average course of injections consisted of about ten to fifteen. The initial dosage was ½ cc., which was gradually increased to 4-5 cc. With the exception of a few cases, all patients felt better mentally and physically, after only a few injections were given. The patients gained in strength and the signs of intolerance gradually disappeared.

Three cases of generalized arsenical dermatitis were observed. One showed a slight improvement only, while the other two responded promptly to therapy. One of these patients, D. A., a man aged 37, presented a dermatitis of six months' duration. The patient could not sleep at night because of intense itching. After the fourth injection of liver extract he stated that "he had great relief, does not itch any more, eats better, and sleeps better."

Two cases of erythematous and scaly eruptions were observed. One of these followed the injection of mapharsen, and cleared up in eight weeks following 8 injections of liver; the other case, which developed following bismuth therapy, showed a slight improvement after six weeks of therapy.

Two cases of pruritus which followed the injection of bismuth responded quite poorly to liver therapy (average number of injections, 12). In one case there was no improvement whatever. In the second there were signs of a slight improvement only.

Among this group there were 19 patients who had a high icterus index (8.0-21.4) following the injections of arsenicals or heavy metals. In 18 of these cases the icterus indices decreased (average decrease 4.5) following an average of 10.8 liver injections. In one case the icterus index increased following liver therapy.

One patient developed an icterus index of 15 and leukopenia (white blood cells 4,850; red blood cells 3,080,000) following an injection of an arsenical. The condition improved in twelve weeks.

therapy

Changes in the Icterus Indices Following Liver Extract Injections (see Tables 7, 8, 9, and 10)

In a previous investigation<sup>8</sup> an opinion was expressed that liver extract injections may cause the decrease of the icterus indices of slightly damaged livers and thus help the liver to return to its normal functioning. Because the number of cases studied in the previously mentioned investigation was too small (21) to draw any conclusions, I decided to follow up this problem on a larger number of cases, studied under different conditions.

Sixty-nine cases were observed and divided into three groups. In the first group (22 cases see Tables 7 and 8) I was dealing with patients who were receiving liver extract injections given alone. The interim between the discontinuance of the arsenical or heavy metal and the taking of the icterus index was noted. Icterus indices were done before a course of liver injections was instituted, and repeated immediately or shortly after the completion of the course. While the patients were under liver therapy, they did not receive any other medications (orally or parenterally). Nor were they asked to adhere to any special diets, such as are usually advised in cases suspected of liver dysfunction. In other words, if following liver extract injections, the icterus index showed some decrease, this could be attributed either to spontaneous improvement of liver function following the discontinuance of the offending drug, or to the influence of liver extract injections.

Following liver therapy the icterus indices decreased in 21 out of 22 cases; the average decrease was 4.5 units. Among these 21 cases there

were 12 in which the liver therapy was instituted five days to three weeks after the arsenical or heavy metal in question was discontinued. The average decrease of the icterus indices in these cases was 4.9.

In 6 cases the interim was between ten to fiftysix weeks. The average decrease of the icterus indices was 4.0. We can see that the decrease in the icterus indices was influenced slightly by the length of time which elapsed between the discontinuance of the drug and the institution of liver therapy. Spontaneous decreases in the icterus index may occur within the first few weeks after the arsenical or heavy metal is discontinued. The spontaneous factor, however, could hardly play a role in cases in which ten-fifty-six weeks passed between the discontinuance of the offending drug and the institution of liver therapy, and I may therefore say, with a fair degree of certainty, that the decrease in the icterus indices in these cases was caused chiefly by the liver therapy.

In 3 cases (2 in which no arsenical or heavy metal was ever given and one in which the arsphenamine was given twenty-one years ago), the decrease (4.2) in the icterus indices was undoubtedly caused by liver extract injections.

In the second group (47 cases—see Table 9) the study was confined to changes in the icterus indices following liver therapy given concurrently with arsenicals or heavy metals. In 23 cases the liver extract was given concurrently with arsenicals. In 13 out of these 23 cases (56 per cent) the icterus indices decreased following an average of 16.4 injections of bismuth given concurrently with liver extract.

Arsenicals and heavy-metal injections may not cause any damage to the liver, but it could hardly be assumed that they would improve the function of the liver (except in rare cases of hepatitis). It would be logical to infer, therefore, that the decrease in the icterus indices following arseno- or heavy metal therapy given concurrently with liver extract injections was due primarily or solely to the injections of liver extract.

The beneficial effect of liver extract on the functions of the liver is illustrated in Table 10, presenting the changes in the icterus indices following injections of arsenicals or heavy metals

with or without liver therapy. In this third group (composed of cases belonging to the first two groups) the icterus index changes in cases treated with some arsenical or heavy metal (without liver) were noted. Thereafter, the same arsenical or the same heavy metal, and whenever possible, the same number of injections, were given concurrently with liver extract, and the changes in the icterus indices were again noted. The differences in the changes of the icterus indices were then observed. cases were studied. In 9 out of these 13 cases the icterus indices increased when the arsenicals or heavy metal were given without liver. icterus indices decreased in the same nine cases when the same arsenical or the same heavy metal was given with the help of liver. In two cases the icterus indices increased, whether liver was given or not. The increase, however, was more pronounced when no liver was given. In one patient (S. H.) the increase of the icterus index was about the same whether liver was given or not. In another patient (H. W.) the icterus index increased when arsenical No. 1 was given without liver, and remained unchanged when the same arsenical was given concurrently with liver.

We may see from Table 10 that liver extract injections in 12 cases out of 13 caused the decrease or prevented a pronounced increase of the icterus indices of patients treated with arsenicals or heavy metal.

In order to determine which component of the icterus index is influenced by liver therapy, special icterus indices were done at the suggestion of Miss Mattice<sup>23</sup>—namely, splitting the icterus index into yellow color due to carotin and yellow color due to bilirubin. The results obtained in 9 cases are illustrated in Table 11.

Out of 8 cases in which, following liver extract injections, the icterus index showed a decrease, 7 presented at the same time, a decrease in the yellow color due to bilirubin. It is also noteworthy that the average decrease in the yellow

color due to bilirubin (4.4) was more pronounced than the decrease of the entire icterus index (3.4) (carotin + bilirubin). If further study on more cases will confirm these findings, that factor will be an additional proof that when liver extract injections are followed by decreases in the icterus indices, these liver injections are improving the function of the liver.

#### Untoward Reactions

Most of the investigators stress the very small number of after-effects following liver extract injections, 9.24-26 However, as time goes on and the use of liver extract becomes more popular, reports on untoward reactions will be forthcoming more frequently.

Some authors reported cases which developed angioneurotic edemas,27 urticarias,7.28-30 genererythema,31,32 attacks alized of bronchial asthma,33-35 sudden weakness36,37 (fainting, sweating, diarrhea, dyspnea) pruritus,28 uterine bleeding, 38 etc. A fixed eruption following the injection of crude liver extract was observed.21 The same author tells of his experience with a case of mycosis fungoides, in which a flare-up of the lesions occurred each time after an injection of liver extract. Some authors speak of moderate pain following the injection of liver. In some cases the local reaction lasted for almost one week.23 A case is also mentioned36 of a patient who had no trouble with one kind of liver extract but when another form was used a severe urticaria developed.

It is believed that "there are two types of reactions, one of an allergic nature, the other probably attributable to vasodepressor substances not well defined chemically."<sup>23</sup>

Most of my patients tolerated the injections of liver extract except for slight and transient pain and discomfort at the site of the injection.

It is noteworthy that 4 of the patients who were pregnant received the antisyphilitic therapy concurrently with liver extract without any ill effect on either the patients or the course of their pregnancies.

However, five of my patients developed untoward reactions which are noteworthy. One patient developed nausea after each injection of liver. It had to be discontinued. Another patient, following an injection of 3 cc. of liver extract, complained of sudden dizziness. weakness, tendency to faint, and pain in the left side of the chest. The patient recovered in five minutes. A week later he received a smaller dosage of liver extract without any after-effects, and continued to receive weekly injections in gradually ascending dosages without any reaction. A third patient who tolerated crude liver extract developed palpitation of the heart and general weakness when another form of liver extract was given by mistake, and the last patient complained each time of a very severe local pain lasting more than twenty-four hours, following the intramuscular injection. Because of that the intravenous method of administration was instituted in this case.

# Intravenous Administration of Crude Liver Extract

Local pain following the intramuscular method of injecting liver extract is a quite frequent occurrence. Although it does not last very long in the large majority of the cases, occasionally, however, it may cause considerable discomfort to the patient. It may be especially distressing for nervous and apprehensive patients, who will refuse to submit to an intramuscular injection, There are also some patients who require supportive medication who present many scattered, deep, indurated areas of connective tissue scars in the buttock, aftereffects of numerous intramuscular injections of heavy metal. In all these instances the intravenous route of administration of liver extract is indicated. This method was suggested to me in 1938 by Dr. E. A. Sharp.<sup>39</sup> Twenty-six of my patients received an average of 14 injections of liver extract given intravenously. Except for a mild flushing of the face and shortness of breath, which lasted for not more than fifteen to thirty seconds, patients did not show any signs of discomfort. In one case a patient developed a moderate attack of herpes zoster after 6 intravenous injections of liver extract were given. Whether the herpes zoster was caused by the injection of liver or was coincidental with it is difficult to determine. As a matter of precaution the dosage of liver extract used was small at the start ( $^{1}/_{4}$  cc.) and the dosage was gradually increased until 3 cc. was reached. After that a dose of 3 cc. was given once or twice weekly. The injections were given very slowly (three to four minutes), and by this means the flushing of the

face and the shortness of the breath were prevented or ameliorated.

### Comment

The value of crude liver extract in 114 cases treated with arsenicals or heavy metals was studied. It seems to me that the usefulness of liver extract as a supportive measure in cases presenting difficult therapeutic problems was fairly well established in this study. Out of 52 cases with different kinds of systemic disturbances, previous history of intolerance to drugs, skin eruptions, and other complicating conditions, 47 tolerated the arsenicals or heavy metals well, with the help of liver, and gained in strength under therapy.

Although the question of the prophylactic value of liver extract is still uncertain, I feel that liver extract may, in some cases, prevent manifestations due to intolerance to arsenicals or heavy metal; 50 per cent of the cases showed improvement. Even if we admit the possibility of spontaneous change in the hypersensitivity in a certain number of cases, this factor could hardly explain the improvement in some cases with a "time factor" of one to two weeks.

The best results were obtained in cases which received the largest number of liver extract injections (56 per cent improvement) and also in cases in which the offending drug was readministered with a smaller dosage (53 per cent improvement). It is also noteworthy that in some cases with initial failures several attempts had to be made and more liver injections had to be given before the patients' hypersensitivity improved.

The majority of my cases presenting existing manifestations due to intolerance to arsenicals or heavy metal showed improvement following liver therapy. The impression gained in the previous investigations that liver extract injections exert a beneficial effect on the function of the liver was fully confirmed in this investigation. The icterus index changes following liver therapy were observed in 69 cases. In the great majority of these cases a decrease in the icterus indices following liver extract injections was noticed. And, I may add, in my opinion the decreases in most of these cases were due primarily to the liver extract injections.

Because the chief importance of the liver lies in its detoxifying ability, 6,15,39 any drug which tends to impair the liver inhibits its detoxifying action, and as a result, intolerance to one or several drugs may develop. 15,18 On the other hand, liver extract injections while improving the impaired function of the liver, 4,17,40,41 will also increase its detoxifying ability, and as a result the intolerance to the drugs may decrease,

and, in addition, the manifestations due to this intolerance may improve.

No special study of the influence of liver extract on the blood counts was made, because its regenerative influence on the hemopoietic system was fairly well established in the previous investigation8,9 and it is a generally accepted fact.1,4,39 It is suggested that the beneficial effect of liver extract injections on the function of the liver and its detoxifying ability, together with the beneficial effect of liver extract on the blood count, will explain the value of liver extract injections as a supportive measure in cases receiving arsenicals or heavy metal, especially in those cases presenting difficult therapeutic

Very few reactions were observed in this series. However, cases of intolerance to liver extract are reported in the literature. Because of that it is advisable to be very cautious when administering liver extract injections. These should be started with a small dosage and increased gradually until the desired dosage is reached. While the dosage is of no importance in a reaction due to true allergy, "the reactions due to liver extract containing vasodepressor substances might be entirely prevented by limiting the amount administered at any time."33 It is also advisable to use one kind of liver extract throughout the entire course. In some cases when the local pain is very intense, the intravenous method of administration of liver extract may be used. However, the injections should be given very slowly in order to avoid any complications.

# Conclusions

- 1. The results of the investigation of the effect of injections of crude liver extract as an aid to arseno- or heavy-metal therapy in 114
- Crude liver extract is a useful supportive measure in cases presenting difficult therapeutic problems.
- 3. Crude liver extract may be useful in the prevention of some manifestations due to intolerance to arsenicals or heavy metal, especially in cases of gastrointestinal disturbances (improvement in 60 per cent of the cases). A few cases with pruritus and mild skin manifestations were also benefited by liver therapy.
- Crude liver extract is a useful therapeutic agent in some cases presenting manifestations due to intolerance to arsenicals or heavy metals.
- 5. The investigation of the prophylactic effect of liver extract indicated that the best results were obtained in cases which received the largest number of liver extract injections.
- 6. The results of the investigation indicate

that liver extract injections cause a decrease of the icterus indices and thus improve the impaired function of the liver in most of the cases.

7. This beneficial effect of liver extract injections on the function of the liver and its detoxifying ability, together with the beneficial effect of the liver extract on the blood counts, explain the usefulness of liver extract injections in cases receiving arsenical or heavy-metal

8. Although very few reactions were observed by the author, special caution must be observed in administering liver extract injections. In some cases the intravenous method of administration may be used.

#### Discussion

Paul Gross, M.D., New York City—Dr. Astrachan has undertaken a difficult but important job in trying to find a rational method for preventing and treating arsphenamine reactions.

The variety of reactions encountered and the lack of knowledge still prevalent concerning their exact mechanism explain why even the data resulting from years of accurate work like those presented here, are still not fully convincing. I believe it is necessary to draw a line between the reactions due to hypersensitivity and those commonly called toxic. The majority of cases discussed in this paper showed so-called toxic reactions, or, to use a better term, signs of intolerance to arsphenamine.

Let us consider for a moment the meaning of these toxic reactions. Qutside of the massive dose therapy, the amount of arsphenamine used in syphilis therapy is far below the toxic levels. Since only a certain percentage of patients treated show signs and symptoms of intolerance, we are confronted with individual variations different from those known as hypersensitivity. Why is it, then, that some individuals do not tolerate a drug so well as others? It apparently is due to an inferior detoxification mechanism.

The role of the liver and other organs in detoxification has been known for many years. Only the rapid development of biochemistry and the science of nutrition have brought out new and valuable facts about the substances which are involved in detoxification. The study of the sulfa drugs, chloroform and carbon tetrachloride poisoning, butter yellow cancer, cirrhosis of the liver and of the fatty livers due to choline, inositol, and other vitamin deficiencies in experimental animals, have stimulated research which is rapidly advancing our knowledge of liver function. The application of this knowledge to clinical medicine is already proving itself very fruitful.

Liver extract is a source of vitamins, especially those of the B complex, which are building stones of enzymes of biologic oxidation. The effect of chemotherapeutic drugs on parasites is apparently due to their interference with enzyme systems in microorganisms without which life is not possible. We know that even the therapeutic dose of a drug will have a similar effect on the cells of the host organism, but the amount of damage is so small that no noticeable changes will take place in the various organs, provided their detoxification mechanism is in good order.

Recent research has proved that the state of nutrition of the individual is an important factor in maintaining normal liver function, which includes detoxification. In addition to the vitamins, the essential amino acids, the phospholipids, and adequate caloric intake are indispensable for the protection of the liver.

The parenteral liver extract supplies the vitamins, especially of the B complex, the pernicious anemia factor, adenylic acid, and other unknown factors. Therefore it is necessary to give our patients undergoing antisyphilitic therapy specific instructions about their nutrition in order to insure the addi-

tional protection afforded by a high protein, high vitamin, and high caloric diet, low in fat.

Food rationing and shortage in certain nutritional elements which we have to expect during the coming period of the war and in the postwar period give these considerations paramount importance to the syphilologist. I have only to remind you of the high incidence of postarsphenamine jaundice during and after the first World War in Europe to illustrate this point.

Although Dr. Astrachan's presentation contains interesting observations about the effect of parenteral liver therapy on the various manifestations of arsphenamine intolerance, his most valuable contribution lies in the data concerning the icteric index of patients treated with arsphenamine or bismuth and the beneficial effect obtained by liver therapy. These figures indicate that the original water technic was used, and the reductions of the icteric index following liver therapy are constant and large enough, especially in some of the pathologically high values, to recommend this method as a protective procedure.

That the repair of liver damage was to a greater part due to the liver therapy is demonstrated (1) by the persistence of a high icteric index in some of the cases, for months and even years after arsphenamine or heavy-metal therapy, (2) by the response of such long-standing liver damage to the subsequent parenteral liver therapy, and (3) by the results of the concomitant use of liver injections with arsenical or bismuth therapy.

These findings and some of the effects on other reactions make it clear that parenteral liver extract is a valuable adjunct in the prophylaxis and treatment of some by-effects of antisyphilitic drugs.

The increasing tendency toward intensive treatment methods calls not only for congratulations to Dr. Astrachan on his excellent work and the results achieved, but imposes on us the duty to join him wholeheartedly in his effort to reduce these reactions and accidents which retard or weaken our antisyphilitic therapy.

Clinical work should be guided by the more accurate facts obtainable in experimental research. For this reason, my coworkers and I at Columbia University have for several years devoted ourselves to the study of the protective mechanism for chronic metal poisoning of the rat. From the experience gained in analyzing the effect of chronic zinc poisoning, we hope to find a new approach to the study of arsenical and other metal poisonings.

In short, our findings thus far demonstrate that animals maintained on a suboptimal supply of pantothenic acid develop clinical signs of a vitamin deficiency when fed high levels of zinc. Control animals fed the same amounts of pantothenic acid do not show the deficiency syndrome. Animals receiving optimal amounts of pantothenic acid will withstand the effect of the toxic doses of zinc and appear normal. Unpublished experiments of ours have further shown that high protein diets and additional amounts of inositol also afford a high degree of protection against zinc poisoning in animals maintained on suboptimal doses of pantothenic acid. Our experiments on thallium poisoning have

demonstrated that a different protective mechanism exists against this metal and that separate investigations will be necessary for arsenic, lead, and other metals.

Until our knowledge in this field has been broadened, we shall depend on the use of parenteral liver extract recommended by Dr. Astrachan, the use of ascorbic acid advocated by other authors, and last but not least on the regulation of the dietary intake of proteins, carbohydrates, fats, and vitamins as protective and therapeutic measures for reactions due to arsphenamine, bismuth, and gold therapy.

Dr. Astrachan, New York City—I wish to thank Dr. Gross for his discussion and for his constructive criticism. The prophylactic value of liver extract is still uncertain, and this problem requires further study and experiment. It seems to me, however, that some reactions due to toxicity may be prevented or ameliorated to such an extent that the arsenical or heavy-metal therapy may be resumed. This is probably achieved by the process of detoxification. The function of the liver and its detoxifying ability are benefited by liver extract injections, and that explains the usefulness of liver extract in cases receiving arseno- or heavy-metal therapy.

In answer to Dr. Combes I may add that the crude liver extract (1/2-1 U.S.P. unit per cc.) was

used in this investigation. The crude preparation contains the detoxifying materials. According to Dr. Sharp, the crude liver extract contains more extraneous material than the highly concentrated or refined liver extract, "since by processing to obtain the high concentration of the potent factor several of the inert liver fractions are removed. Thus it can be assumed that whatever detoxifying effect is obtained from liver extract can be attributed to the inert components of the less refined preparations." The injections were given one to three times a week and the maximum dosage reached was 5 cc. I may take Dr. Gross' advice and use larger dosages. This advice was also given to me by Dr. Sharp several years ago.

The intravenous method of administration of liver extract was used in 26 cases. With the exception of a mild flushing of the face and shortness of the breath lasting about fifteen to thirty seconds, the patients tolerated the injections well. In many cases the shortness of breath was ameliorated or even prevented by giving the intravenous injection

very slowly.

I believe that the intravenous method of administration may be used, but the intranuscular method is preferable because of the absence of the above-mentioned reactions and also because of the possibility of giving larger dosages.

# NEW FOUNDATION FOR SCIENTIFIC RESEARCH'

Establishment of the Passano Foundation, Inc., has been announced by the Williams & Wilkins Company, Baltimore, "for scientific and educational, purposes, particularly to provide for scientific research and to publish the results of scientific research and to make awards for meritorious achievements in scientific research." The foundation is named for Mr. Edward B. Passano, chairman of the board of the Williams & Wilkins Company, who has actively been identified with the development of scientific publishing for a period of more than thirty-five years. By the terms of the charter of the foundation, the board of directors may inaugurate the establishment of an annual award not to exceed \$5,000 for the outstanding contribution to the advancement of medical science made within the year by an American citizen.

A number of other projects are under consideration, one of which is the advancement of postgraduate instruction among physicians in sections of the country not accessible to medical centers in the larger cities. Mr. Robert S. Gill, president of the Williams & Wilkins Company, has been elected president of the new foundation, which will have its headquarters at Mount Royal and Guilford avenues, Baltimore 2.

Members of the Foundation's board of directors include Dr. Emil Novak, associate professor of obstetrics, Johns Hopkins University School of Medicine, Dr. George W. Corner, director of the Embryological Laboratory of the Carnegie Institution of Washington, and Mr. George Hart Rowe of the Williams & Wilkins Company, all of Baltimore.—

J.A.M.A., Feb. 19, 1944

#### TUBERCULOSIS AND PUBLIC HEALTH

Improved health conditions are in evidence on a broad front. Yet on all sides we encounter much disability and many deaths due to diseases for which we have adequate means of prevention and control.

Tuberculosis stands out prominently as one of the chief offenders in this group. Sixty thousand annual deaths represent but a small part of the penalty paid by the American people for failure to eradicate this disease. It is estimated that half a million persons in the United States have tuberculosis. . . . yet the vast majority of this group will not be given the advantages of early diagnosis and early treatment. This presents a public health problem of major significance.—H. D. Lees, M.D., in Social and Economic Aspects of Tuberculosis, 1948

## THE EDITOR'S JOB

Getting out this paper is no picnic.

If we print jokes, people say we are silly.

If we don't they say we are too serious.

If we clip things from other magazines

We are too lazy to write them ourselves.

If we don't, we are stuck on our own stuff.

If we don't print every word of all contributions

We don't appreciate true genius.

If we do print them, the columns are filled with junk.

If we make a change in the other fellow's write-up,

we are too critical.

If we don't, we are blamed for poor editing. Now, like as not, some guy will say We swiped this from some other sheet. WE DID.—Delaware State M.J.

# TREATMENT OF NONPYOGENIC INFECTIONS WITH RADIATION THERAPY

IRA I. KAPLAN, B.Sc., M.D., New York City

THE wonderful achievements of science in producing germ-killing chemicals and synthetic vitamins have served to prolong human life and save it from the dire effects of infection.

In a world desperately engaged in war and destruction, there have paradoxically emerged lifesaving procedures in medicine which are almost miraculous. The use of chemotherapy has radically revised our prognosis in most cases of pyogenic infections and made the care of the severely wounded much more readily effective. Nevertheless, out of the war, too, have appeared infectious conditions which chemotherapy has as yet been unable to control. The distribution of vast bodies of armed men into environments completely new to them, the inevitable changing of habits, the enforced living under conditions less civilized than those they were formerly accustomed to-all these circumstances have subjected the men to diseases which are hardly noticed in their normal lives at home. This is especially true of the American soldiers who have been sent abroad to live in an environment and under conditions which they had not been prepared to withstand.

Out of this cauldron of war infections there have appeared an increasing number of lesions uncontrolled by chemotherapeutic measures which are ordinarily successful. It is in the treatment of such infections that x-ray therapy has played and is continuing to play a most important role.

# Diphtheria

Diphtheria, almost eliminated here at home, now begins to reappear by reason of crowding young men together in such close proximity, subjected to the dangers of respiratory hazards. To this is due the persistence of diphtheria in patients otherwise normal, or the diphtheria carriers

In 1922, during the course of an epidemic in Detroit, Michigan, Hickey¹ first reported upon the control of diphtheria carriers with x-ray therapy. In 1932 Rogers² reported 100 per cent good results in the treatment of 18 cases at the Municipal Colony Hospital in Trenton, New Jersey.

Bychowsky<sup>3</sup> et al. reported satisfactory results in the treatment of a series of 96 cases.

Ledoux-Lebard' reported treating 9 cases with good results. Similar good results from such treatment in the cases under his care were reported by Wahl<sup>5</sup> in 1932. Dubowyi<sup>5</sup> reported satisfactory results in 75 cases which he treated.

In 1938, Streil' summarized the results in his treatment of 150 cases of diphtheria carriers with roentgen rays. His material comprised two groups. The first were the "dischargers," or those who, though recovered from the clinical form of diphtheria, still showed positive smears for from three to four weeks after the onset of the disease. The second group were the "accidentally discovered diphtheria carriers." Following x-ray treatment, good results were obtained in 95 per cent of the cases in the first, and in 97 per cent of the cases in the second group.

As already known, the action of the x-rays is not directly bactericidal, but experience has shown that irradiation favorably affects inflammatory conditions, the endotoxins formed thereby destroying the bacteria. In addition, the fibrosis which later sets in with shrinkage of tonsillar tissue eliminates the crypt formation so favorable for the lodgment of diphtheria bacteria.

Heineke,<sup>8</sup> and later Warthin,<sup>9</sup> showed experimentally that as promptly as fifteen minutes after roentgen treatment lymphocytes undergo nuclear disintegration, and this continues for several days. Desjardins<sup>10</sup> and Hodges<sup>11</sup> associated this rapid destruction of lymphocytes with the liberation of large quantities of labile, active endotoxins which are bactericidal.

Streil suggests that Pordes' theory regarding the action of x-rays is most plausible. Pordes holds that the beneficial action of x-rays is due to the mobilization of proteolytic ferments within the leukocytes, and that under the influence of the x-rays these ferments exert the bactericidal action

Williams and Fullenlove<sup>12</sup> believe the results are achieved by restoring diseased mucous membranes to normal, thus eliminating the organism and establishing an immunization against the bacilli.

In 1940 I<sup>13</sup> reported on the treatment of 11 cases in the Radiation Service at Bellevue Hospital and since then have treated 3 more cases. Six of the patients were males and 8 were females. The oldest was a woman aged 63 and the youngest a boy of 7. The oldest man was 30 and the

Read at the Annual Meeting of the Medical Society of the State of New York, Buffalo, May 6, 1943.

Director, Radiation Therapy Department, Bellevue Hospital, New York City; clinical professor of surgery, New York University College of Medicine, New York City.

youngest girl was 13. In 4 cases the nose and throat were involved; in 6, the throat alone. The nose, the nasopharynx, the tonsil, and the larynx were each involved once. The duration as a carrier varied from two to five weeks. Irradiation was requested only after all other methods of control had failed. The patient was declared cured if two sets of cultures proved negative. Treatment was given with high voltage x-ray therapy of the following factors—180-200 kv., with 0.5 mm. Cu plus 1 mm. Al filter at from 40-50 cm. distance through 8 by 10 or 9 by 12 cm. portal.

Treatment was administered through both sides of the neck with the rays directed through the tonsillar areas. The dose was 150 r per treatment per area, one treatment per week for three weeks. In some cases four or five treatments were needed to achieve results. Seldom did untoward effects occur—manifested by pains in the jaw and neck which passed away within the next day without active treatment.

One week after completion of treatment the throat cultures are usually negative for diphtheria. In some instances negative cultures may follow one or two treatments, in which case a third dose of irradiation may not be required. Occasionally some cases require a fourth treatment before a negative culture is achieved.

In our cases the treatment was immediately effective in most cases and delayed relief was obtained in 2 cases and recurrence in only one case, Case 14. The reports from the Contagious Disease Hospital on Cases 12, 13, and 14 are given herewith in detail (see Table 1).

Case 12.—J. M., a woman aged 29, was admitted on May 10, 1940, as a carrier, with involvement as a post-tonsillar abscess which did not respond to all the usual antidiphtheritic measures. Four x-ray treatments were administered on May 14, 17, 21, and 24. On May 28, 1940, she was discharged as cured, two sets of cultures having been negative for diphtheria.

Case 18 .- H. S. male, was admitted as a diphtheria carrier on July 11, 1941. He was discharged as cured on August 2, 1941, after two sets of negative nose and throat cultures were obtained. He was readmitted on August 9 for the same condition. Nose and throat cultures were reported as "toxic." He was referred for x-ray therapy on October 2, 1941. After having received radiation therapy, the cultures and virulence tests were still positive. It was not until November 22 that two consecutive negative nose and throat cultures were obtained. Virulence tests of nose and throat cultures were toxic on November 7, following radiation therapy. He was discharged on November 27, 1941, since two sets of negative nose and throat cultures were obtained on November 22 and 23.

Case 14.—J. C. was admitted to the Contagious Disease Hospital as a diphtheria carrier on January 29, 1941. Since the nose and throat cultures were persistently positive, he was referred to Bellevue Hospital for x-ray therapy. On March 3, 6, and 10, he was given x-ray therapy. However, subsequent nose and throat cultures still showed toxic Klebs-Loeffler bacilli. Throat cultures were negative on March 23 and 24, and nose cultures on March 26 and 27, 1941. He was also treated locally with gentian violet and hexylresorcinol and received 30 cc. of diphtheria antitoxin. He was discharged on March 29, 1941. He was readmitted to the Contagious Disease Hospital from another institution on April 23 and tests on the nose and throat cultures were positive for Klebs-Loeffler bacilli. Under several treatments, two consecutive sets of negative nose and throat cultures were obtained on April 28 and 29, 1941. He was discharged on May 2, 1941.

Comment.—Evidently in Case 14 the usual course of three treatments was not sufficient to completely control the condition at once. Unfortunately the patient was not again referred back for additional therapy, for with additional

irradiation, control would have been achieved more expeditiously, as in the cases previously treated.

If the diphtheria focus was in the nasopharynx, irradiation was administered directly through the nose and face area. The factors employed were similar to those used for the tonsillar treatment.

## Actinomycosis

This is a very serious disease characterized by an infection due to the ray fungus, the actinomyces bovis. It manifests itself usually by the development of lumpy tumors associated with loss of weight and strength and an irregular temperature. It may attack soft tissues, viscera, and bone.

The definite method of infection is not always known, but it is believed that the mouth is the most frequent portal of entry. In most instances the disease is said to be due to the eating of or picking the teeth with infected grass, straw, or grains, and entrance is usually via a carious tooth area. MacCallum<sup>14</sup> noted that wood and straw are the frequent sites of this fungus, which is transmitted via mouth to the victim. Direct infection from animals has occurred. While this infection may involve all types of tissues, it is found clinically most often in the mouth, neck, abdomen, and chest.

Men are more frequently affected than women. Treatment up to recent times was not very efficacious; chemicals and/or surgery were employed. With the advent of the x-rays a new method of treatment of infectious diseases was believed to be at hand. Harsha<sup>15</sup> in this country was the first to report successful treatment of actinomycosis with x-rays. MacKee<sup>16</sup> states that x-ray therapy is not only indicated in this disease but that such treatment is superior to any other. Smith17 states that "roentgen treatment is a distinct advance in the therapy of actinomycosis." However, it was soon noted that x-rays had no direct effect, but that the results in the treatment of infections had been achieved through the effect on the surrounding tissues and the lymphocytes. While the precise action of x-rays on actinomycosis has not been determined, the known effect of x-rays on infectious processes is thought to play an important part in controlling this condition, too. MacKee says, "the probable reason for this high degree of radiosensitiveness is the fact that the entire lymphatic system is easily and profoundly affected by both x-rays and radium." Smith believes there is a direct effect of the x-rays on the fungus in vivo. Xrays stimulate the formation of fibrous tissues which may encapsulate and constrict the infection area.

The most frequent region of involvement is the

cervico-facial area. The site of infection may often be a carious tooth or a bruised mucous membrane area within the mouth. The lesion starts as a raised "lump," bluish in color, which gradually extends, softens, and breaks down with abscess and sinus formation, draining a yellowish pus which contains the ray fungus. The sinuses usually break through the skin and may be painful. When the mandible is involved the bone has an appearance similar to that noted in periosteal tumefaction.

Thoracic lesions occur usually in men, with the lung most frequently the site of the infection. Involvement is usually via inhalation through the mouth and pharynx. Occasionally metastatic actinomycotic lesions are seen.

The involvement may be nodular or miliary in type. The condition simulates bronchopneumonia or tuberculosis, with severe cough and expectoration of profuse fetid mucus, which contains the sulfur granules of the ray fungus. The lesions may coalesce and form large abscess cavities and gradually break through the chest wall in sinus formation. The roentgenograph is not uniform, and distinctions must be made between actinomycosis and chronic lung abscess, tuberculosis, or empyema with thickened pleura. Kugelmeier18 describes well the diagnostic difficulties encountered with this disease, when it involves the chest. Where areas of destruction are present with or without reaction of osteomyelitis or periostitis and there is destruction of ribs or sternum, actinomycosis is probably the lesion. Finding of the ray fungus clinches the diagnosis. Prognosis, however, in these cases is poor. Abdominal actinomycosis occurs rather frequently but is rarely diagnosed preoperatively. symptoms are so similar to appendicitis that it is often mistaken for the latter. In 1924 Kaplan<sup>19</sup> reported on such a case. In abdominal actinomycosis 50 per cent of the cases have ileocecal involvement and present a clinical picture of chronic appendicitis. The lesion occasionally begins as a granular tumor which extends and breaks down with abscess formation which often burrows via a sinus through the abdominal wall.

Radiation therapy in actinomycosis is best carried out with high voltage x-rays filtered by 0.5 mm. Cu. We are in accord with Smith, who says that "as a general rule, those cases which received large initial doses made the most rapid and uneventful recoveries," and further, that those patients which had the minimum of surgical interference recovered more rapidly than did those who were subjected to surgery. Treatment is given over the involved areas. One or more areas may be treated at one time, 150 r administered at one- to three-day intervals until 900–1,500 r are given each area. A second, or more,

series may be given at four-to six-week intervals, should the condition persist or recur. Drainage should be kept open until the sinuses heal from within outward. Table 2 lists the cases treated. Usually several series may be required to completely control the lesion. In our series 8 cases were treated involving the mouth and face, 2 involving the lung, and 4 involving the abdomen and the hand. In one case the diagnosis was not confirmed by finding the ray fungus. In the other 7 actinomycosis was definitely proved pathologically. Four patients survived and were healed, 3 patients died of the disease, and one case not proved to be actinomycosis was completely cured by x-ray therapy.

We have treated 8 cases and the following are illustrative of those treated (see Table 2).

Case 1 (4631).—M. DeP., a woman aged 20, single, a picture-frame maker, was admitted September 26, 1930, complaining of swelling and ulceration with discharging sinuses involving the left jaw and face. The condition began in May, 1930, as a swelling over the left jaw with pain radiating to the head.

The swelling was hard and approximately one inch in diameter. Gradually the gums became more tender and the patient went to the dentist, who x-rayed the jaw and reported the presence of an infected lower third molar, which he extracted. Pain was relieved, but infection and swelling grew progressively worse. In June, 1930, the gum was incised and drained, and repeated incisions were made in June and July, when pus-draining sinuses had broken through the cheek. The patient was weak and rapidly lost weight. In September she was referred to Bellevue Hospital, where examination revealed a swelling of the left cheek and jaw, of a violet-bluish hue, punctuated by many granulationlike openings from which profuse yellowish pus was flowing. Within the mouth there was swelling of the gingiva. Smear showed actinomycosis (ray fungus). X-ray of the jaw and chest revealed no important pathology.

She was referred for irradiation and high voltage x-ray therapy was instituted and administered in weekly doses for four weeks between September 29 and October 21. A 25 per cent skin dose was given each time (the dose measurement in 1930 was still based on the skin erythema equivalent to about 600 r). The factors used for the x-ray treatment were 200 ky., 0.5 mm. Cu plus 1 mm. Al filter, 30 cm. distance, 8 by 10 and 9 by 12 cm. field5.

Following this treatment the granulations about the sinus opening were removed with endothermy, and x-ray therapy was again administered to 75 per cent of a skin dose, the last treatment on January 16, 1931.

On April 30, 1931, the condition was completely healed and the general condition of the patient was excellent. In 1932 the patient married and has given birth to two normal children. She was last seen by us on January 7, 1941, with no evidence of recurrence, and her general condition is excellent.

Comment.—In this case, despite multiple involvements, the treatment given proved adequate, with definite satisfactory results.

Case 2 (7895).-L. W., a man aged 33, married, a boiler-maker, was admitted on March 1, 1933, for infection in the hand and pain in the back. In July, 1932, nine months before admission to the Radiation Service, a sudden swelling appeared on the back of the left hand which later broke down and exuded pus through two sinuses on the dorsum and one on the palmar surface of the hand. He gave self-treatment and in October, 1932, noticed pain in the back. In January, 1933, a tender swelling appeared over the right chest wall. He had lost 30 pounds, had some cough and night sweats, but no hemoptysis. Because his condition became more and more painful he entered Bellevue Hospital, in poor condition. There was an ulceration involving the palm and dorsum of the left hand and a large mass was found on the right lateral chest opposite the ninth to twelfth ribs, which was fluctuant and quite tender. Aspiration smear from the chest lesion showed the ray fungus of actinomycosis. An x-ray of the chest showed interstitial changes and fibrosis at the root of both lungs extending to the base and adjacent to the heart on the right. The right diaphragm was elevated and fixed. The patient was referred for x-ray therapy and this was administered from March 1, 1933, to March 23, 1933; a dose of 600 r was given to each area over the anterior and posterior left hand and to the left chest area. The patient left the hospital improved but failed to return subsequently for further observation.

Case 3 (5177).—V. T. G., a 20-year-old woman, was admitted April 16, 1931, to the Radiation Service complaining of a draining sinus through the anterior abdominal wall. She reported that in December, 1929, she had a sudden severe abdominal attack which was diagnosed as appendicitis, and an appendectomy was performed. She made an uneventful recovery and remained well until January, 1930, when the abdominal scar broke down and a sinus draining pus developed, which continued to discharge until June, 1930, when a surgical attempt was made to close the draining sinus. This proved unsuccessful and the patient went to the Mayo Clinic in January, 1931, where a diagnosis of actinomycosis was made and x-ray therapy was instituted.

irradiation, control would have been achieved more expeditiously, as in the cases previously treated.

If the diphtheria focus was in the nasopharynx, irradiation was administered directly through the nose and face area. The factors employed were similar to those used for the tonsillar treatment.

# Actinomycosis

The roentgenograph is not uniform, and distinctions must be made between actinomycosis and chronic lung abscess, tuberculosis, or empyema with thickened pleura. Kugelmeier<sup>18</sup> describes well the diagnostic difficulties encountered with this disease, when it involves the chest. Where areas of destruction are present with or without reaction of osteomyelitis or periostitis and there is destruction of ribs or sternum, actinomycosis is probably the lesion. Finding of the ray fungus clinches the diagnosis. Prognosis, however, in these cases is poor. Abdominal actinomycosis occurs rather frequently but is rarely diagnosed preoperatively. symptoms are so similar to appendicitis that it is often mistaken for the latter. In 1924 Kaplan 19 reported on such a case. In abdominal actinomycosis 50 per cent of the cases have ileocecal involvement and present a clinical picture of chronic appendicitis. The lesion occasionally begins as a granular tumor which extends and breaks down with abscess formation which often burrows via a sinus through the abdominal wall.

Radiation therapy in actinomycosis is best carried out with high voltage x-rays filtered by 0.5 mm. Cu. We are in accord with Smith, who says that "as a general rule, those cases which received large initial doses made the most rapid and uneventful recoveries," and further, that those patients which had the minimum of surgical interference recovered more rapidly than did those who were subjected to surgery. Treatment is given over the involved areas. One or more areas may be treated at one time, 150 r administered at one- to three-day intervals until 900—1,500 r are given each area. A second, or more,

the anterior chest. One dose was administered, and the next day, without previous signs indicating distress, the patient suddenly expired. No autopsy was obtained.

Comment.—The source of infection may have been from the countryside where the child played in the fields, which might have harbored the fungus. In spite of what seemed to be adequate treatment, cure was not achieved in this case.

Case 6 .- J. P., a 24-year-old man, a slaughter-house worker, was admitted to the Radiation Service on June 20, 1924, complaining of swelling over the chest with a draining sinus. His illness began in February, 1924, with what appeared to be a cold. Later pain and swelling appeared over the front of the chest and extended to the right side of the neck, with increased pain on respiration and incessant cough, hemoptysis, loss of 14 pounds, and weakness. For several months he doctored himself; then, because of increasing distress, he sought aid at the clinic. Because of the severity of the condition he was admitted to Bellevue Hospital, where on June 6, 1924, a provisional diagnosis of cellulitis of the chest, possibly tuberculosis, was made. The swelling over the sternum was incised and drained, and some pus was removed for pathologic study. On examination this showed typical ray fungus of actinomyces bovis,

The patient was referred for x-ray therapy. Between June 20 and June 27, 1924, x-ray therapy was administered to the anterior and posterior chest areas. About a 100 per cent H. E. D. dose of high voltage x-ray, 200 kv., 0.5 mm. Cu plus 1 mm. Al was given.

The patient failed to improve and between July 21 and August 23, 1924, additional high voltage x-ray therapy was administered and a 100 per cent H. E. D. dose to the right anterior chest and a 55 per cent dose to the left side were given. On August 25, 1924, the patient left the hospital only slightly improved. In October he felt very much worse and on October 27, 1924, entered another hospital for relief. There his condition was found to be poor; swelling and sinus formation on the chest wall had An x-ray examination at that time showed massive infiltration of the left lung area, suggestive of chronic tuberculosis. On several occasions he was operated upon with incision and drainage and curettement of the sinuses. Examination of the smears and tissue removed at operation, however, showed no typical actinomycosis. He was given larger doses of potassium iodides and supportive care. However, he progressively got worse and was discharged in poor condition to a custodial hospital, on May 25, 1925, where he died.

Comment.—In this case the condition was already far advanced, as indicated by intrathoracic involvement, when he reported for medical care. The dosage of x-ray given was too small and treatment was not given in sufficient total quantity to achieve a favorable result.

Case 7.-J. Mc., 23-year-old man, a laborer, was

admitted June 16, 1923, for a chronic sinus lesion in the mouth, chills, sweats, septic temperature, and loss of weight. X-ray examination of the chest on admission showed irregular peribronchial infiltration throughout, with enlargement of the hilar nodes and pleural effusion. Examination of the pus of the draining sinus showed actinomycosis. This patient was referred for x-ray treatment on June 25, 1923. One treatment of 100 per cent of the H. E. D. of high voltage x-ray therapy was administered directly over the anterior chest. The patient steadily grew worse and was too ill to be moved for further treatment. He died on July 6, 1923.

Comment.—This patient was already too ill when treatment was requested and the dose, though large and administered at one session, was inadequate to control the infection, and the large single dose may have been too severe for toleration in the patient's weakened condition.

Case 8 .- P. B., aged 40, a locksmith, was admitted on April 7, 1927, to the surgical service at Bellevue Hespital with cough, draining chest wall sinus, and swelling over a previous operative scar. In December, 1925, he had noted a swelling on the anterior chest wall. He entered the hospital, where the swelling was incised for abscess and the patient was discharged to the outpatient clinic for dressing. However, the lesion failed to heal and he was readmitted at this time. Clinical diagnosis of actinomycosis was not confirmed by pathologic study. Because of the persistent draining sinus and the clinical diagnosis of actinomycosis, x-ray therapy was requested. High voltage x-ray therapy was administered to the anterior and posterior right chest area. A 100 per cent dose was given to the anterior and a 50 per cent dose to the posterior; a 25 per cent dose was given a lateral area. Treatment was given over this period, from April 7 to June 30, 1927. Following treatment the lesion completely healed.

Comment.—Because of the absence of confirmatory pathologic study one can only surmise that this was a true case of actinomycosis. Even so, it shows the value of x-ray therapy for healing sinuses.

#### Gas Bacillus Infection

Up to a short time ago, gas bacillus infection had nearly always presaged a fatal outcome. Radical surgery was usually the method of choice, with large associated morbidity. Later on chemotherapy was employed, without, however, materially changing the results, and mutilating operations were still necessary. In 1931 James F. Kelly<sup>20</sup> reported the effect of the utilization of x-ray therapy on infections for the treatment of gas gangrene in the belief that if this type of lesion could be controlled, the necessity for extensive mutilating surgery with its accompanying morbidity would be lessened. In a recent report covering twelve years' study Kelly<sup>21</sup> indicates

Because of economic reasons the patient returned to New York and continued her treatment at Bellevue Hospital.

On examination on April 16, 1931, the patient was thin, pale, and complained of abdominal pain and weakness. There was a large healed scar over the right lower quadrant, at the lower end of which were two draining sinuses. On the posterior lateral abdominal surface just above the crest of the ilium were two other draining sinuses. Because of the diagnosis and operative findings it was deemed advisable to treat the whole abdominal cavity with xray therapy. Four anterior and four posterior portals were outlined, and between April 16 and June 8, 1931, a 100 per cent dose (measurement of dosage at that time) was administered to each portal. The factors were high voltage x-ray therapy, 200 kv., 0.5 mm. Cu plus 1 mm. Al filter, 30 cm. distance, 10 by 15 cm. fields, administered in daily divided doses.

In August, 1931, the condition was improved but there was still present a slight drainage and another course of x-ray therapy was instituted. Two areas were used, an anterior and a posterior right pelvic area, and a 100 per cent dose was given each area. The factors were the same as previously used except the distance, which was 40 cm.

In October, 1931, sinus drainage, though slight, was still present and further irradiation was administered; 830 r were given through the anterior right pelvis. The same factors as previously used were employed. The patient continued to improve but on December 28 examination revealed that a small area of involvement was still present. A dose of 800 anteriorly and posteriorly through the pelvis was administered.

In May, 1932, six months later, although there were no visible signs of involvement and no definite symptoms of recurrence, it was decided to administer x-ray therapy as a prophylactic measure and a dose of 1,000 r was administered to the anterior and posterior abdomen through a large area without a localizing cone. X-ray examination of the chest at this time revealed no involvement there.

From then on the patient improved continuously and when last reported in June, 1942, was in good health.

Comment.—This case illustrated the necessity of repeated x-ray treatments in order to control a long-standing lesion with extensive intra-abdominal extension.

Case 4.—C. C., 29-year-old teamster, was admitted January 25, 1928, complaining of lumps on the left jaw. The condition had begun two years previously with a small lump on the left jaw, which a dentist suggested was due to an abscess of the third molar tooth area. Extraction of the molar and incision of the gum were carried out. The condition healed for three months. Then a mass reappeared in the jaw, protruded within the mouth, broke down, and extended into the cheek with a sinus draining to the outside, exuding a yellowish pus. A clinical diagnosis of actinomycosis was made.

On admission there was a large swelling over the left mandible, fluctuating slightly, with a draining sinus to it. Examination of the exuded pus was positive for ray fungus (actinomycosis). X-ray examination showed no bone involvement. X-ray treatment was administered in 25 per cent H. E. D. doses until a 100 per cent dose was given. High voltage x-ray therapy, 200 kv., 0.5 mm. Cu plus 1 mm. Al was used. A moderate reaction occurred and for a time there was some limitation of jaw movement. The patient was discharged as improved on February 13, 1928, but on March 2, 1928, he returned because of increased swelling due to recurrence of the condition. X-ray treatment was again administered in three doses of 25 per cent each to a total of 75 per cent. He was discharged improved and then on May 1, 1928, examination revealed a healed lesion with the sinus completely closed and no functional disability.

Comment.—Here we have a case which represents a possible source of infection through handling animals (cattle). Regarding treatments, the slow response at first was due to the administration of too small a dose of irradiation. Recurrence required further treatment.

Case 5.—L. D., a 14-year-old girl, was admitted October 25, 1928, complaining of pain and abscess in the chest and cough. The condition began in July, 1928, while the child was in the country, where she developed a painful mass on the chest wall to the right of the sternum. She was first taken to another hospital, where a hard, round, slightly tender mass was found on the anterior chest wall to the right of the sternum and extending from the third to the fifth rib. The mass was not fluctuant. An x-ray showed abscess formation. On August 8, 1928, at the hospital, operation was performed and a small amount of pus was evacuated from the swelling; it was found that the sternum was eroded and soft, with a sinus leading into the mediastinum, and also that the second and third ribs were involved. Resection of the diseased ribs and clearing out of the abscess cavity with drainage was done. The pus and biopsy of the removed tissues showed actinomycosis.

The patient was then transferred to Bellevue Hospital, with a large draining sinus in the anterior chest wall still showing actinomycosis and an ulcer on the left lower thigh, swelling of both breasts with sinuses in the right, and a draining sinus in the posterior neck area. X-ray therapy was advised and Treatment was administered to the instituted. anterior and posterior mediastinum and posterior neck and lower left thigh areas between October 25 and December 29, 1929. A 140 per cent dose was given the anterior mediastinum, 100 per cent to posterior mediastinum, 100 per cent to posterior neck areas. Marked improvement followed and on January 21, 1929, the lesion on the leg was healed, drainage was lessened but persisted from the chest and the left side of the neck, and there still remained a small draining sinus in the right breast. On January 28, 1929, additional treatment was begun to

same day or shortly after, in spite of treatment. In 10 cases gas infection symptoms were noted following operation, in 3 following amputation procedures, in one after appendectomy, in one after herniotomy, in one following colostomy for cancer of the rectum, in one after removal of a foot callus, and in one following incision and drainage of a scrotal infection. In 4 cases positive culture was not obtained before treatment. There were seven deaths following treatment; 6 cases healed free of infection after treatment; in one case, involving the perineum, incision and drainage followed x-ray therapy, which hastened healing. In one case no follow-up record could be ascertained. A résumé of the cases follows.

Case 1.—C. L., a 40-year-old man, was admitted on October 5, 1937, complaining of a large, painful, swollen scrotum. Examination showed an extensive infection with cellulitis involving the whole perineal and scrotal area. There was widespread crepitation present, and on October 5, 1937, he was given an emergency x-ray treatment of 150 r over the involved area and local wet dressings were applied. On October 7 and 13 other x-ray treatments were administered and supportive therapy was given. In the meantime the involved tissues were incised and drained. In spite of treatment, the patient died from acute toxemia on October 13, 1937.

Comment.—This case was evidently too far advanced when referred for x-ray therapy to derive any benefit from it.

Case 2.—T. B., a 30-year-old man, was referred on April 19, 1939, for extensive infection with marked crepitation of the soft tissues over the pelvis and perineum which had been present for a number of days. He was given sulfa drugs and neoprontosil. X-ray therapy was given on April 19 and 21 but in spite of treatment the patient succumbed.

Comment.—In this case, in our opinion, too long a period had elapsed before therapy was instituted to be of help.

Case S.—N. W., a man aged 56, was referred for x-ray therapy on October 24, 1939, because of definite gas infection of the foot following irritation of a previously sore area. Although he was in bad condition, x-ray therapy was administered over the whole lower leg and foot area and the immediate amputation of the foot was carried out. However, the patient failed to rally and died the next day, October 25, 1939.

Comment.—Too little therapy was given too late, and surgery followed too soon before the effects of irradiation could control the infection.

Case 4.—M. G. R., a man aged 35, was referred for x-ray therapy following infection of the mouth with gas crepitation of the soft tissues of the face and neck. Six treatments were given in the morning and afternoon of April 12, 1940, in the morning

of April 13, the morning and afternoon of April 15, and in the morning of April 19. High voltage x-ray was used, a 150 r dose given at each session. In spite of all treatment the patient succumbed on April 19, 1940.

Case 5.—A. A., a man aged 50, was referred for x-ray therapy because of the appearance of gas bacillus infection following amputation of the thigh several days earlier for a foot lesion. X-ray therapy was administered on May 26 and 27, 1940, to the amputated stump over the area of crepitation. Chemotherapy had been given and was continued, but in spite of treatment the patient succumbed on May 27, 1940.

Comment.—Perhaps had x-ray therapy been instituted before operation to the primary foot lesion gas infection might have been avoided. Again, the chemotherapy may have, as Kelly believes, inactivated the x-ray therapeutic effect.

Case 6.—J. F., a 75-year-old man, was referred on March 13, 1941 for x-ray therapy because of gas infection of the leg. Previously, on February 26, 1941, his leg was amputated for a diabetic gangrenous toe. He was given three treatments of high voltage x-rays on March 12, 13, and 14, besides antitoxin, chemotherapy, and diabetic treatment. However, in spite of treatment he succumbed on March 17, 1941.

Comment.—In this case old age, diabetes, and secondary infection all tended to counteract any effect x-ray therapy might have had.

Case 7.—M. L., a man aged 61, was admitted on March 23, 1938, to the psychopathic division following the first stage procedure operation for sigmoid cancer done at another hospital. Later closure of the abdominal wound was attempted with subsequent gas bacillus infection of the abdominal wall and hemolytic streptococcus blood stream infection. One treatment of high voltage x-ray was administered to the anterior abdomen and a dose of 150 per cent given. The patient expired shortly thereafter.

Comment.—Evidently death was due to the streptococcus infection and the patient was too ill to receive any benefit from x-ray therapy.

In those cases where recovery followed x-ray therapy, treatment was instituted early and in most instances was given twice a day, as recommended by Kelly. Our experience is limited to only a few cases, because most clinicians tend to rely on chemotherapy for infections and refer to the radiotherapist for assistance only after chemotherapy has failed and the patient already is in too poor a condition to reap the true benefit of x-ray therapy. In our hands early diagnosis and early instigation of x-ray therapy have proved to give the best results.

The following cases illustrate this fact.

Case 8.-R. L., a man aged 41, was referred on

that gas gangrene need no longer be regarded as a serious disease. Serum therapy is of no avail. Kelly believes that x-rays should be used early in gas infection, but that even in late stages it will still effect cure. Sulfa drugs are incompatible with x-rays and should not be used.

Kelly<sup>22</sup> very properly states that the "ease of application, the lack of complications, and the possibilities of doing so much good should make x-rays as a prophylactic measure a widely used agent for contaminated severe injuries. Their use is indicated in every contaminated ward in which tetanus antitoxin is ordinarily given, and we recommend this procedure. X-ray should be used promptly after the injury in the hope of preventing any and all types of organisms from establishing a growth."

Pendergrass and Hodes<sup>23</sup> state that there is overwhelming evidence in favor of irradiation of gas gangrene. Even in doubtful cases they advise prophylactic x-ray therapy. Their technic calls for x-ray therapy with moderate voltages and treatment administered morning and evening for three days in succession, 100 r with 1 mm. Al filter being given at each sitting. They recommend that great pains be taken to treat wide of the areas, for it is the toxin produced by the infection that kills the patient.

Kelly further states that "by means of x-ray therapy, infections due to the gas-forming organisms may be localized and the toxic action neutralized. Therefore, there is nothing about the situation which requires hasty or drastic measures, and the same surgical rules governing the

care of other infected wounds in relation to débridement should prevail. In the past, it was necessary to attempt surgical measures in the presence of a gas bacillus infection because of the seriousness of the disease and because no other treatment seemed to be effective in localizing the process. Since x-rays control the gas bacillus infection, all infected wounds now have the same status regarding débridement, if the term means the "excision" of tissues as indicated in its definition. However, if débridement can also mean "incision" of tissues, we think that it might be permissible, or even indicated, during the active stage of the disease, to permit escape of deeply trapped pockets of gas or collections of fluid. This applies only to cases that are far advanced when first seen by the radiologist or to cases in which infections develop after a penetrating type of injury such as a hypodermic injection."

In our technic we have treated the cases in one series and have employed the usual high voltage x-ray therapy, with 200 kv., 0.5 mm. Al filter and 40–50 cm. distance. Although we have not employed superficial x-ray therapy as used by others, the results achieved by them indicate that it is likewise a proficient method of treatment. We plan to use this type of therapy in our next series of cases.

There were 14 cases of gas infection referred to the Radiation Service for treatment, 12 men and 2 women (Table 3). All but four had already received treatment with antitoxin and chemotherapy before x-ray therapy was requested; some cases were so toxic that death ensued the same day or shortly after, in spite of treatment. In 10 cases gas infection symptoms were noted following operation, in 3 following amputation procedures, in one after appendectomy, in one after herniotomy, in one following colostomy for cancer of the rectum, in one after removal of a foot callus, and in one following incision and drainage of a scrotal infection. In 4 cases positive culture was not obtained before treatment. There were seven deaths following treatment; 6 cases healed free of infection after treatment; in one case, involving the perineum, incision and drainage followed x-ray therapy, which hastened healing. In one case no follow-up record could be ascertained. A résumé of the cases follows.

Case 1.—C. L., a 40-year-old man, was admitted on October 5, 1937, complaining of a large, painful, swollen scrotum. Examination showed an extensive infection with cellulitis involving the whole perineal and scrotal area. There was widespread crepitation present, and on October 5, 1937, he was given an emergency x-ray treatment of 150 r over the involved area and local wet dressings were applied. On October 7 and 13 other x-ray treatments were administered and supportive therapy was given. In the meantime the involved tissues were incised and drained. In spite of treatment, the patient died from acute toxemia on October 13, 1937.

Comment.—This case was evidently too far advanced when referred for x-ray therapy to derive any benefit from it.

Case 2.—T. B., a 30-year-old man, was referred on April 19, 1939, for extensive infection with marked crepitation of the soft tissues over the pelvis and perineum which had been present for a number of days. He was given sulfa drugs and neoprontosil. X-ray therapy was given on April 19 and 21 but in spite of treatment the patient succumbed.

Comment.—In this case, in our opinion, too long a period had elapsed before therapy was instituted to be of help.

Case 3.—N. W., a man aged 56, was referred for x-ray therapy on October 24, 1939, because of definite gas infection of the foot following irritation of a previously sore area. Although he was in bad condition, x-ray therapy was administered over the whole lower leg and foot area and the immediate amputation of the foot was carried out. However, the patient failed to rally and died the next day, October 25, 1939.

Comment.—Too little therapy was given too late, and surgery followed too soon before the effects of irradiation could control the infection.

Case 4.—M. G. R., a man aged 35, was referred for x-ray therapy following infection of the mouth with gas crepitation of the soft tissues of the face and neck. Six treatments were given in the morning and afternoon of April 12, 1940, in the morning

of April 13, the morning and afternoon of April 15, and in the morning of April 19. High voltage x-ray was used, a 150 r dose given at each session. In spite of all treatment the patient succumbed on April 19, 1940.

Case 5.—A. A., a man aged 50, was referred for x-ray therapy because of the appearance of gas bacillus infection following amputation of the thigh several days earlier for a foot lesion. X-ray therapy was administered on May 26 and 27, 1940, to the amputated stump over the area of crepitation. Chemotherapy had been given and was continued, but in spite of treatment the patient succumbed on May 27, 1940.

Comment.—Perhaps had x-ray therapy been instituted before operation to the primary foot lesion gas infection might have been avoided. Again, the chemotherapy may have, as Kelly believes, inactivated the x-ray therapeutic effect.

Case 6.—J. F., a 75-year-old man, was referred on March 13, 1941 for x-ray therapy because of gas infection of the leg. Previously, on February 26, 1941, his leg was amputated for a diabetic gangrenous toe. He was given three treatments of high voltage x-rays on March 12, 13, and 14, besides antitoxin, chemotherapy, and diabetic treatment. However, in spite of treatment he succumbed on March 17, 1941.

Comment.—In this case old age, diabetes, and secondary infection all tended to counteract any effect x-ray therapy might have had.

Case 7.—M. L., a man aged 61, was admitted on March 23, 1938, to the psychopathic division following the first stage procedure operation for sigmoid cancer done at another hospital. Later closure of the abdominal wound was attempted with subsequent gas bacillus infection of the abdominal wall and hemolytic streptococcus blood stream infection. One treatment of high voltage x-ray was administered to the anterior abdomen and a dose of 150 per cent given. The patient expired shortly thereafter.

Comment.—Evidently death was due to the streptococcus infection and the patient was too ill to receive any benefit from x-ray therapy.

In those cases where recovery followed x-ray therapy, treatment was instituted early and in most instances was given twice a day, as recommended by Kelly. Our experience is limited to only a few cases, because most clinicians tend to rely on chemotherapy for infections and refer to the radiotherapist for assistance only after chemotherapy has failed and the patient already is in too poor a condition to reap the true benefit of x-ray therapy. In our hands early diagnosis and early instigation of x-ray therapy have proved to give the best results.

The following cases illustrate this fact.

Case 8.-R. L., a man aged 41, was referred on

March 30, 1939, for x-ray therapy following gas bacillus infection of the abdominal wall after a herniotomy performed shortly before. X-ray therapy was given twice on March 30 and on March 31, and once on April 1. Two areas were treated; 150 r of high voltage x-ray were given each area at each sitting. Chemotherapy was given in the usual manner. The condition rapidly improved and the patient was discharged on April 24, 1939, completely cured.

Case 9.—D. B., a 31-year-old man, was referred for x-ray treatment on July 21, 1939, for gas infection of the abdominal wall following a herniotomy. Xray therapy was given to the whole abdominal wall on July 21 and 22. Following treatment the infertion promptly healed.

Case 10.-T. M., a woman aged 43, was referred on July 21, 1939, for gas bacillus infection following amputation of the thigh shortly before. Two areas were treated on July 21, and twice on July 22, 23, and 24. On July 26, 1939, the condition of gas infection was entirely cured.

Case 11.—L. K., aged 61, a man, was referred because of gas bacillus infection following secondary incision of a callous infection on the foot. Treatment previously with sulfa therapy and Dakin's solution had proved unavailing X-ray therapy was given on September 19, 1941, and twice on September 20, 21, and 22. He improved and on October 24, 1942, was discharged completely cured.

Case 12.—B. Mc., a 10-year-old girl, was referred on March 5, 1941, for x-ray therapy for gas bacillus infection about an appendectomy wound made on February 24, 1941. There was extensive crepitation over the abdominal area about the appendix wound. Antitoxin and sulfa drugs had already been given. Three x-ray treatments were administered, one on March 5 and two on March 6. She improved rapidly and was pronounced cured on March 10, 1941.

Case 13.-P. B., aged 20, a man, was referred April 3, 1939, for gas bacillus infection about an appendectomy wound. Four x-ray treatments, administered two each day for two days, were followed by

Case 14.-A. F., a man aged 30, entered the hospital in an emergency following an accident to his foot and subsequent gas infection. He received six treatments with relief. Because of legal action, no final follow up is available.

# Summary

War conditions, wherein large groups of people are placed in unfavorable environments, are apt to increase the menace from nonpyogenic infection. Chemotherapy is not always effective in this group of infections. X-ray therapy is a readily available effective method of treatment for control of persistent diphtheria carriers; it is the method of choice for the treatment of actinomycosis and is a better method of treatment for bacillus infection than chemotherapy or surgery. A report of cases treated is given.

755 Park Avenue New York City

#### Discussion

Dr. R. C. Wende, Buffalo—Dr. Kaplan's paper regarding radiation therapy of the diseases mentioned is certainly timely and important, inasmuch as many of our returning men will be directly involved so far as rehabilitation is concerned. Without doubt, there will be many cases, chronic and otherwise, which will come to the attention of the radiologist for care. This may be either for alleviation or possible cure. Results of Dr. Kaplan's reported cases of actinomycosis and diphtheria carriers are excellent, inasmuch as some of his patients could be classified as being neglected cases.

The status of patients with gas gangrene or actinomycosis should be brought to the notice of the profession more sharply, so that the sufferers may get the benefits of irradiation.

Many of the so-called diphtheria carriers are merely harborers of diphtheroid bacilli, which are innocuous, and it is therefore generally considered necessary when such organisms are found in a patient's nose or throat on smear and culture, that a virulence test be made. However, in my mind, the best practice would be to eliminate any suspicious Irradiation, as Dr. Kaplan has pointed out. does this very well by changing the topography of the nasal and pharyngeal walls with other possible radio-biologic changes involving the deeper structures and also these cellular elements. Direct action on the organism itself should not be considered impossible, as this organism is pleomorphic, as is also the ray fungus.

The ordinary clinical types of actinomycosis generally show, on smear or tissue preparation, the ordinary club ray fungus. On culture, it is almost impossible to reproduce this characteristic in pure form.

Therefore, while we are dealing with a pleo- or polymorphous organism, it can be considered possible that radiations, either from a tube or radium applicator, might have some direct effect on the cycle of life. Of course, secondary effects on the organism from cellular and vascular changes in the human body are more apparent and possibly more important.

The prevention of chronic indurated nodules or sinus formation in these cases is of prime importance. A careful history on examination should make one suspicious of actinomycosis, so that radio therapy may be instituted early, before there is any tissue breakdown.

In gas gangrene cases, even in widespread involvement, it is important to treat the patient as early as possible, preferably several times daily. This infection is generally resistant to most forms of therapy, including mutilating drainage and surgery. Small doses of irradiation, given at frequent intervals, apparently are more efficacious than the larger doses, and the ray hardness is of very little importance. Some operators use only a filter of 2 or 3 mm. Al and repeat every eight to twelve hours with a dosage of from 75 to 150 r. In view of the fact that this infection is resistant to chemotherapy it is readily seen that it is of prime importance to treat the patient as soon as possible after the infection, of course taking into consideration cleansing or excision of infected, lacerated wounds.

The bodily changes due to irradiation are multiple and complex. That is, we have changes in the circulatory systems, both hemic and lymphatic, in the cellular elements, both fixed and circulating, and also in the vascular walls. Acute inflammations where the cellular infiltration consists mainly of leukocytes, either lymphocytes or neutrophils, respond quite readily to smaller doses producing a possible early erythema with radiobiologic changes in cells which elaborate ferments, enzymes, and antibodies.

As Bengt Sylven's work in a 1940 issue of Acta Radiologica reads, he is able to demonstrate in irradiated tissue of animals sulfuric acid in surrounding connective tissue. He does this with a basic lead acetate preparation, which discolors and is studied microscopically. He claims that the sulfuric acid is a product of decomposition of heparin, which is an anticoagulant of a mucoitin polysulfuric acid in ester linkage. Apparently it is the function of mast cells with cytoplasmic granules of heparin to carry the anticoagulant to the circulating blood. He also noticed that after irradiation, of course in larger doses than therapeutic, that the granular content of the mast cell cytoplasm was markedly decreased. The ultimate fate of the cell is unknown; it probably goes on to destruction. He also quotes Bierich, who found in 1922 that mast and connective tissue cells increase up to five days after x-ray or gamma irradiation.

The normal acid-base equilibrium would be easily changed with the presence of such cellular products of decomposition. Many organisms are extremely sensitive to a slight shift of the cultural pH.

With the doses outlined by Dr. Kaplan there is a large margin of safety of operation to the patient. That is, the involved areas to be treated are usually not too large, and the dosage is very small. In the treatment of naso-diphtheria, even the small dosage over the front of the face is safe as far as late occurrence of late cataract is concerned. For widespread intestinal or cecal actinomycosis, even with large fields of treatment, there should be no diarrhea or change in the blood picture.

The slightly larger dose with the ½ mm. Cu filter is necessary in chronic cases because of the filtering effects of the degeneration of cells, hyalin, calcareous, or otherwise, in the more chronic cases. Therefore, if the patient is seen early before the tissue becomes radio-resistant, smaller doses and quicker results should be expected.

Dr. Andrew H. Dowdy, Rochester, New York—In 1942 Dr. Sewell and I reported on the treatment of 15 cases of clinical gas gangrene. All but one patient received irradiation or irradiation plus one of the sulfonamides. This one received sulfadiazine only. Of these 14 patients, 5 died. One was a definite therapeutic failure; another died of carcinoma of the testicle thirty days after control of the infection. The remaining three deaths occurred in patients 68, 70, and 85 years old, respectively. The Clostridium welchii infection did not seem to have any more to do with their exitus than did coexistent pneumonia, advanced arteriosclerosis, and general debilitation.

In this same paper we reported on our experience with experimental Cl. welchii infection in 255 dogs. Fifty of these dogs received roentgen irradiation. The sulfonamides studied were N<sub>1</sub>-Butyryl sulfanilamide, sulfanilamide, and sulfadiazine. Of the sulfonamides we found sulfadiazine to be superior.

We further found sulfadiazine to be superior to roentgen irradiation. In 25 of the dogs that were given a relatively small amount of inoculum so that 20 per cent of the controls recovered, we salvaged 36 per cent with irradiation, but if we increased the size of the inoculum to that given the dogs receiving sulfonamide therapy, the salvage with roentgen irradiation was not greater than in the control group.

We have continued our studies with a very much larger number of dogs. These latter studies have included three other members of the clostridial group of organisms capable of producing clinical gas gangrene. We have also studied the value of sulfathiazole. While sulfadiazine does not prove equally effective against all the organisms studied, it is superior to the other sulfonamides employed or to roentgen therapy. Further study also convinced us that roentgen therapy and sulfonamide therapy should not be combined.

Our clinical experience with roentgen therapy of clinical gas gangrene convinced us that it was of value. Experimental study in dogs indicated it to be of some value but that it was of less value than sulfadiazine. Consequently we have discontinued roentgen therapy in the treatment of clinical gas gangrene and now resort to the sulfonamides, preferably sulfadiazine.

# Therapeutics

# CONFERENCES ON THERAPY

THESE are actual reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. The next report will appear in the June 1 issue and will concern "Management of Disorders of the Thyroid: I. Hyperthyroidism."

# Chemotherapy of Infections of the Urinary Tract

Dr. C. H. Wheeler: The subject today is the treatment of urinary tract infections. As you know, the treatment of such infections as urethritis, prostatitis, cystitis, pyelitis of pregnancy, and pyelonephritis was unsatisfactory for a long time. Many substances and procedures which we once used-namely, urotropin, ketogenic diet, acidification, alkalinization, and mandelic aciddid not seem to work so well or so frequently as we would have liked. Today the outlook is better.

Dr. Modell will open the conference with a discussion of some of the pharmacologic aspects of

this field of therapy.

Dr. Walter Modell: The pharmacology of urinary antiseptics used to be an elegant subject for discussion because there were so many drugs to talk about. One could discuss them and condemn them and keep going for a long time. But the subject has become much simpler and shorter in recent years, and from the patient's point of view far more satisfactory. In a recent review of the subject only two types of drugs were mentioned: mandelic acid and its immediate derivatives, and the sulfonamide group, in contrast to earlier reviews in which many drugs used to be considered. In another recent review of urology, under the head of urinary antiseptics, no drugs other than the sulfonamides were discussed. One gets the impression that the discussion of any drug other than the sulfonamides in the treatment of this group of infections is of historic interest only. Yet this is not really the case; there are effective drugs other than sulfonamides which still have a place in the therapy of urinary infections; there are drugs still being used which have no place at all in the modern treatment of these infections; and, perhaps most important of all, the problem of an early and exact diagnosis still is of paramount importance and must not be neglected because we have sulfonamides available.

Drug manufacturers are reluctant to bury their dead. Some of the ghosts which still haunt the advertising pages of our medical journals stem from the abandoned field of chromotherapy. There used to be a time when a common form of

treatment of urinary infections was to color the urine. One could color it blue, or green, or orange, or yellow, depending largely on one's taste and in some cases on the kind of professional samples which were lying around the office. This was practiced rather widely until it became apparent to some more acute observers that the bacteria noticed the color of the urine far less than did the patient. Nevertheless, the dyes are still being used, although I believe that they are on their way out.

One of the drugs which has stood the test of time and which should not be entirely forgotten in spite of the more effective newcomers is meth-Helmholtz has shown recently that strains of escherichia coli which were resistant to the sulfonamides and mandelic acid could be treated effectively by methenamine. This drug, therefore, still has a place, although it is now a minor one. It is well to remember that methenamine is effective only in acid media, in which it is broken down to liberate an effective component. Concentrations of about 200 mg. per cent in the urine are necessary; the pH must be 6 or less for therapeutic effectiveness. Concentrations of methenamine greater than 200 mg. per cent are irritating to the bladder; the therapeutic range,

therefore, is rather narrow. Mandelic acid was very unfortunate because,

although it constituted an important advance when discovered, it came so soon before sulfonamides that it never really got a chance to be widely appreciated. It followed logically from the use of the ketogenic diet in the treatment of urinary infections and came as a result of a search for an effective hydroxy acid which would not be metabolized by the normal body. Mandelic acid has the advantage over the sulfonamide derivatives in its effectiveness in infections by Streptococcus faecalis, in which condition none of the sulfonamides is said to be useful. Mandelic acid must be present in the urine in concentrations of 0.5 per cent or over, and the urine must be decidedly acid, with a pH of 5.5 or less.

The chief disadvantages of mandelic acid are

its taste, which is exceedingly difficult to disguise, the fact that it must be taken with a strong acidifying agent, and that it is expensive. In connection with mandelic acid it is necessary to modify the diet rigidly so that its ash is acid. Nevertheless, this group of drugs is effective in a wide range of infections. There are still many instances in which the sulfonamides are not effective or may not be used; in such cases mandelic acid or its derivatives may be the only really effective agents available.

The sulfonamides have, of course, completely overshadowed the field of the therapy of urinary infections. Today I think we can consider only two members of this group as being of prime importance: sulfadiazine and sulfathiazole.

Sulfanilamide and sulfapyridine have been shown to be less effective than these. A more recently introduced member, sulfacetamide, has been said to be of particular value in urinary infections. In an article from the Mayo Clinic, entitled "The Bacteriostatic Action of Sulfadiazine, Sulfathiazole, Sulfacetamide, and Sulfapyridine in Bacteria Isolated from Urinary Infections," which summarizes the differences between these sulfonamide derivatives in the treatment of urinary infections, the evidence is that sulfacetamide is not the drug of choice in urinary infections, but that it does belong in the group of effective drugs.

The superiority of the sulfonamides over other drugs comes not only from their great bacteriostatic properties but also from their unique ability to permeate all the tissues and fluids of the body. Thus they are effective in the parenchyma of organs, surrounding tissues, and mucous membranes.

The solubility of the sulfonamides in the urine is of prime importance, since renal complications are in the main due to the precipitation of the sulfonamides and their acetylated compounds from the urine in some portion of the urinary system. As a group they are relatively insoluble compounds—sulfathiazole and sulfadiazine especially so. With the exception of sulfadiazine, the acetylated compounds are less soluble than the free sulfonamides. The solubility of these substances is increased by alkalinization. Although the sodium salts of the sulfonamides are soluble, sulfonamides so administered are excreted as the free sulfonamide.

It has been stated that the effective concentration of sulfonamides in urine is close to 100 mg. per cent, in in vitro experiments. This is close to the limits of solubility of sulfadiazine and sulfathiazole in urine at pH 7 or 7.5. Bear in mind, therefore, that in attempting to achieve a particular concentration of these drugs in the urine you may be approaching the point at which the sulfonamides precipitate out of solution and cause renal damage. The urine volume must be sufficient to dissolve all the sulfonamides excreted if toxic renal effects are to be avoided.

Mixtures of sulfonamides with mandelic acid and with methenamine are being sold these days. I know of no advantage which comes from such mixtures. Usually in such combinations only one substance is present in amounts sufficient to produce any therapeutic effect; the other drugs are just "trimmings."

Much used to be made of concentrations of these drugs in the blood stream and in the urine. I notice that the tendency is more and more to follow a fairly fixed schedule of dosage and not to try to produce high levels of sulfonamide concentrations in the blood and in the urine. Perhaps we shall hear more about desirable concentrations of the sulfonamides from subsequent speakers.

One agent, phenothiazine, recently suggested as a urinary antiseptic, ought to be mentioned and disposed of quickly. Several years ago this substance was tried as a vermifuge and intestinal antiseptic. It resembles methylene blue in many of its chemical characteristics. It is effective as a urinary antiseptic, but in a recent series of eight cases, hemolytic anemia was produced by this substance in six. Phenothiazine therefore has no place in the therapy of urinary infections, since we have far more effective and safer agents.

DR. WHEELER: Dr. McLellan will continue the discussion.

DR. ALLISTER M. McLellan: The treatment of genitourinary tract infections has been revolutionized in the past ten years by the introduction of (1) simple diagnostic procedure, namely, the excretory urograms, and (2) the sulfonamides.

One cannot emphasize too strongly the importance of careful diagnostic studies before treating infections in the genitourinary tract, since the infections may be the result of an abnormality which in itself is of greater importance to the patient than the pyuria.

A careful physical examination may suggest specific pathologic conditions in the genitourinary tract. Several examples may be cited. Skin infections or boils may be the precursor of a perinephric abscess. Abnormal neurologic conditions may be the cause of residual urine with its sequelae. Abdominal examination may reveal an enlarged or tender kidney. Psoas spasm may mean a perinephric abscess. A suprapubic mass is a full bladder until it is proved to be something else. Inguinal gland enlargement may mean carcinoma or a primary lesion of the penis. scrotal sinus may be caused by tuberculosis of the epididymis. Scrotal palpation may reveal early tuberculosis of the epididymis, and testicular enlargement may be caused by a teratoma or

a gumma, etc. The prepuce should be retracted to examine the glans. The meatus may be of pinhole size, causing serious back pressure. Pus from the meatus should be examined by the Gram stain and cultured for gonococci. Palpation of the urethra may reveal a periurethral abscess.

The collection and prompt examination of all specimens of urine is most important. The male patient should void in two glasses; this may grossly show that the pus is coming from the anterior urethra. In the female, if a casual specimen is positive, a catheter specimen should be obtained to avoid contamination. A specimen of urine from the male for culture is obtained by retracting the prepuce and washing off the glans penis. As the patient continues to void, a specimen is collected in a sterile test tube in "mid-air," as it were.

Rectal examination will determine the anal sphincter tonicity and the mucous membrane changes in the canal itself. The rectal mucosa is palpated routinely at this time. Prostatic palpation will reveal the size, shape, and consistency of that organ, as well as irregularity, edema, and fluctuation. An enlarged, smooth, rubbery gland means benign hypertrophy; a hard irregular gland means carcinoma, tuberculosis, or calculi; an edematous gland is usually inflamed; and a fluctuating gland has an abscess. Palpation of the seminal vesicles and base of the bladder should always be carried out, and bimanual examination may be helpful when carcinoma or calculi are present in the bladder. Prostatic secretion may be obtained for microscopic examination at this time if the condition is not acute.

A plain x-ray and an intravenous pyelogram is a simple benign procedure which gives the physician a wealth of information. The plain x-ray may show an opaque stone, a large kidney (this is significant when its fellow is normal), a soft shadow which may suggest perinephric abscess or residual urine in the bladder if taken after voiding. The intravenous pyelogram may indicate a relatively nonfunctioning kidney, but, nevertheless, sufficient dye may be excreted to demonstrate obstruction and filling defects caused by stones, tumors, or blood clots. If all findings are normal with this procedure, the disease may be in a part of the urinary system which does not grossly disturb function or cause anatomic defects; for example, pyelitis or cystitis.

By a physical examination, simple laboratory tests, and excretory pyelogram a satisfactory working diagnosis may be made so that the patient can be intelligently handled. Cystoscopy is only indicated for confirmation studies or biopsy.

The history of the treatment of urinary tract infection may be divided into three periods:

(1) the preketogenic period, (2) the ketogenic period, and (3) the sulfonamide period.

1. Preketogenic Period.—Prior to 1932 there were innumerable urinary antiseptics which did or did not color the urine. Many caused digestive disturbances. I have been convinced from my own experience that the patient's recovery or improvement was often the natural course of the disease, rather than the result of treatment.

The Ketogenic Period.—The ketogenic diet was ushered in with the discovery that the urine of patients who suffered from ketosis had bacteriostatic properties. This, was attributed to the beta-hydroxy-butyric acid. along this line resulted in the discovery that mandelic acid had equal value. Later, calcium mandelate was introduced because it was less irritating to the gastrointestinal tract, and today in this group it is the drug of choice, although in cases with renal insufficiency and in pregnancy it may produce acidosis. This drug acts only in the excretory ducts of the urinary tract and, therefore, is effective only on the exudate superficial to the mucous membrane, whereas the sulfonamide drugs are carried deep into organs to the infecting agent and into the mucous membranes by the tissue fluids. Calcium mandelate is a satisfactory urinary antiseptic for the commoner uncomplicated urinary tract infections. Ambulatory patients tolerate it well because its unpleasant effects are usually limited to gastric distress and there are no specific systemic reactions. The optimum dose of calcium mandelate is 2 Gm. every four hours; a total of 12 Gm. per day. The output of the urine is limited to approximately 1,200 cc., which would give a concentration of about 1 per cent mandelic acid in the urine. The pH of the urine should be 5.5 or less for the best results.

3. The Sulfonamide Period.—In 1935 the discovery of sulfanilamide, followed by its derivatives, opened a new field in the therapy of infections of the urinary tract. Of these drugs, sulfathiazole and sulfadiazine have proved to be the most useful.

The discovery of pus alone in the urine is not an indication for the administration of the drug. Pyuria is not a disease. As stated previously, a working diagnosis can usually be made by smears, culture, and intravenous pyelogram. Cystoscopic procedures are reserved for specific treatments and, when necessary, for diagnostic confirmation.

One must bear in mind that, with the exception of the specific infections, gonococci, and tuberculosis, there invariably exist pathologic changes in the tissues of the urinary tract before the invading organism arrives. These changes may be due to a stone, tumor, stricture, etc.,

many of which cause retention of urine or pus. Recurring attacks of pyuria should always call for an intravenous pyelogram.

Gonorrhea is treated with 1 Gm. of sulfathiazole four times a day for seven days. I should especially like to call your attention to the fact that no local treatment is indicated. One may expect failure in about 5 per cent of cases of gonorrhea treated with sulfonamides. The test of cure in these patients is both culture and stained smear of any secretion from the meatus, first glass of voided urine and prostatic secretion. Cultures are made on chocolate agar grown under increased carbon dioxide tension.

Cases of nonspecific urethritis do not respond well to sulfonamides. Nontuberculous epididymitis and prostatitis do well with rest and may be helped with small doses of sulfathiazole or sulfadiazine, but the cause of the disease should always be investigated.

A case of pyelitis or pyelonephritis always indicates the need for an intravenous pyelogram. Ureteral drainage may be indicated if the obstruction is in the ureter, and bladder drainage if the obstruction is in the urethra or bladder neck.

One Gm, of the sulfonamides four times a day for five days rarely causes intoxication and almost invariably gives excellent results in uncomplicated cases.

Renal complications due to the sulfonamides clinically fall into two groups: (1) patients with an oliguria resulting in nitrogen retention. The urine in these cases shows a small amount of albumin and rarely blood or crystals; and (2) patients in whom the drug crystallizes and who experience renal colic or have obstruction in the urinary passages by conglomerated masses of crystals. Both types are best handled by forcing fluids and alkalies, and not by the immediate passage of catheters to both kidneys. scopic treatment may be necessary in the second but it has not been necessary in my experience. Since we now know that the crystals can form in the tubules of the kidneys themselves and cause anuria, the passage of a catheter up the ureter in these cases might do more harm than good. Such complications are best prevented by the liberal use of fluids.

Dr. Wheeler: Finally, I should like to ask Dr. Gordon Douglas to say something from the standpoint of the gynecologist.

Dr. R. Gordon Douglas: The obstetrician or gynecologist is interested in urinary tract infections because of the frequency with which these complications are encountered in everyday practice, the reasons being the anatomic changes that are associated with pregnancy in the way of dilatation, tortuosity, increase in length and lateral displacement of the ureter, and the tendency to develop a mild hydronephrosis in at least 80 per cent of all pregnant patients. The gynecologist also has to deal with urinary tract infections because of changes following the development of tumors, surgical procedures, and complications in the bladder following operative procedures.

It is of a good deal of interest to us then to know something about the normal status of the urinary tract from a bacteriologic point of view prior to the onset of pregnancy. My own experience indicates that the healthy urinary tract is free from organisms at all times.

It is of interest to note that Marple, who recently studied the urinary tracts of a large number of women admitted to a medical service. found 69 per cent of the cultures negative, but in 19 per cent he found a bacilluria associated with pyuria and in an additional 10 per cent he found bacilluria alone.

Jaameri, in Sweden, has recently analyzed the results of urine cultures of some 600 patients who were pregnant or in the early puerperium, and found the colon-aerogenes group of organisms present in some 16 per cent of the cases. The experience of the latter investigator is quite in line with our own-i.e., that in early pregnancy the urinary tract, if it has previously been normal, is sterile. There is a tendency for bacilluria to develop as the physiologic hydronephrosis develops and it always, in our experience, precedes the development of pyuria.

As Dr. McLellan stated, the early signs of pyuria are almost invariably asymptomatic. By the time the patient develops clinical signs of the disease in the way of pain, fever, or chills, we are usually dealing with a well-advanced stage of the disease. We are then confronted with the problem of treating an infection caused by a temporary physiologic abnormality. The treatment is usually directed toward the infection rather than the anatomic changes.

Our experience with all urinary antiseptics. with the exception of mandelic acid and the sulfonamide drugs, indicates that they have been entirely ineffective. The sulfonamide drugs which we have employed have been limited largely to three compounds-i.e., sulfanilamide. sulfathiazole, and sulfadiazine.

I used sulfacetamide when it was first introduced, and in my experience the value of that drug is comparable to that of sulfanilamide. There is no essential difference.

Formerly, when we employed sulfanilamide it was our custom to restrict fluids during the administration of the drug in order to keep the urinary output below 1,000 cc. We have altered this practice in the employment of sulfathinzole and sulfadiazine, and we make every effort to maintain a daily urinary output of at least 1,500

By adherence to this technic we have not encountered any of the serious renal complications, such as hematuria or renal colic, that have been so frequently reported by others. In addition, if we have a patient who has rather poor renal function, the dose is reduced accordingly. It may take only one-half the dosage to obtain the same results. It has always been our practice to obtain frequent determinations of concentration of the drug in both the urine and the blood. In my experience the concentration of the drug in the blood or urine does not give any definite indication of what therapeutic effects we are going to obtain. The information is dependent more on the nature of the infecting organism and the duration and extent of the pathologic process.

## Case Reports

A few short case histories may serve to illustrate some of our results.

Case 1.—For example, there is the case of a young woman, 19 years of age, who has been in the Woman's Clinic for the past month. She gave a history of mild urinary tract infections at the ages of 3, 5, 6, and 15 years. This patient was entirely asymptomatic and afebrile throughout her pregnancy. Intravenous pyelograms revealed a bilateral pyelonephritis, more marked on the left side, with greatly distended renal pelves and ureters. The disease was detected because of pyuria. The causative organism, Bacillus aerogenes, disappeared following sulfathiazole therapy. Despite the extensive involvement the patient has had no symptoms.

There is one difficulty in interpreting the results. Our infections are almost invariably (93 per cent) caused by one of the members of the colon-aerogenes group of organisms. After the administration of sulfonamide one can, in the great majority of instances, eliminate at least temporarily the causative organism from the urinary tract, but in our experience it is very common, particularly in the patient who has a chronic infection, to find a nonhemolytic type of streptococcus, and in some instances an anaerobic streptococcus as a residual chronic invader of the urinary tract. This was true in the case history just cited. I don't know the significance of these organisms. I look upon them as a secondary invader, as one would find in wound infection. That may or may not be correct. As long as these organisms are found on culture, it seems to me that we are not positive that the urinary tract infection in question has been eliminated. As far as I am aware most of the clinical reports which have come out of this country have not referred to this particular problem.

Case 2.—Let me present a historical review of a patient with a chronic infection last seen in our clinic one week ago.

She was treated with ketogenic diet, mandelic

acid, pelvic lavage, cystoscopy, and sulfonamides. There were positive cultures practically throughout the entire period of six years. The first time a negative culture was obtained was following the administration of sulfanilamide, and negative cultures were obtained on several occasions after sulfadiazine. This patient was seen in the Outpatient Department one week ago and a positive culture was obtained. It goes to show how ineffectual are urinary antiseptics in patients with chronic pyelonephritis.

In relation to some of the statements that I just made, I might mention the results of an analysis I made recently of a small group of our patients. At the time of the first culture in the antepartum group, in thirty instances we were dealing with the colon bacillus and in one instance with B. aerogenes. We had only one patient in whom the infection was due to Staphylococcus aureus. In the postpartum group the first culture revealed B. coli in forty-seven instances and B. aerogenes seven times. This relationship is what we see in our routine practice, year in and year out. In the last cultures the colon bacillus was present in one of the antepartum patients and B. aerogenes in two. In the postpartum group the colon bacillus was present in 12 and B. aerogenes in 2 patients. The Staphylococcus albus and the nonhemolytic streptococcus were present relatively frequently postpartum. Diphtheroids were occasionally found. The Staphylococcus aureus was eliminated. Only one-half of the patients had absolutely sterile urine when last seen.

If we look at the problem in another way—i.e., from the standpoint of elimination of the causative organism, which is the usual method of reporting the results in the literature—and relate our results to the drug employed, we find that in the antepartum group where sulfanilamide was employed, the causative organism was eliminated in 11 and was still present in 10 patients. In the postpartum group, with the same drug, the organism was eliminated in 20 and was still present in 14 patients. With sulfadiazine and sulfathiazole, the causative organism was eliminated in all but one patient during the course of therapy.

If the index of cure is based solely on the microscopic examination of the sediment of the urine, we will frequently overlook streptococci or other organisms present in small numbers. Pyuria may persist where the colon-aerogenes infection has been eliminated, and only a nonhemolytic streptococcus may be found on culture.

DR. WHEELER: We would like now to have some discussion. Do you have questions that you would like to ask the participants?

STUDENT: What percentage of urinary infections would clear up by themselves without any treatment at all?

Dr. McLellan: In the uncomplicated cases I

would expect practically 100 per cent to clear up spontaneously; in the complicated cases if the infection did clear up I would expect it to return.

Dr. Modell: I wonder if we could get a statement as to which of the sulfonamide drugs is preferable in these infections, sulfadiazine or sulfathiazole?

DR. WHEELER: Dr. Douglas, from your expe-

rience, which is the drug of choice?

Dr. Douglas: As far as I can tell from the information available there is practically no difference between sulfathiazole and sulfadiazine in the matter of therapeutic effectiveness. However, in my own experience, sulfadiazine causes the patients less distressing subjective symptoms.

Dr. Wheeler: What about your experience,

Dr. McLellan?

Dr. McLellan: I have had excellent results in 95 per cent of my cases in the treatment of gonorrhea with both sulfathiazole and sulfadiazine. However, 90 per cent of experience has been with sulfathiazole. If one drug failed to cure the patient, the other also failed.

STUDENT: If the sulfadiazine works mostly behind the kidney epithelium, is it necessary to put a restriction on the maximum amount of

urine?

Dr. McLellan: The output of urine should be at least 2,000 cc. daily to protect the kidneys. I see no objection to its being doubled. The concentration of the drug in the blood and tissues is far more important than that in the urine.

DR. WHELER: Do your results depend on the

type of infecting organism?

Dr. McLellan: In the uncomplicated cases, in the absence of a tumor, retention of urine, or a stone, our results are good in all common types of infections except in that by the proteus and nonhemolytic streptococcus. The drug has no effect on tubercle bacilli in the urinary tract.

Dr. Harry Gold: Has there been any experience here with acquired resistance to any of the sulfonamides by any of the organisms encountered either in gynecology or in general urology?

DR. WALSH MCDERMOTT: I may have something to report on that, Dr. Gold. The Streptococcus viridans which we have been getting from the urines of these patients on Dr. McLellan's and Dr. Marshall's service are in many cases resistant to 10 mg. per cent of sulfadiazine, whereas the Str. viridans which we get from the blood of patients with subacute bacterial endocarditis is not resistant to the drug.

Dr. Gold: Suppose we turn the question this way: Have you encountered any cases that resisted one of the sulfonamides and then was cured by another? That relates to the question of shifting from one preparation to the other if matters don't go well with the first.

Dr. Douglas: I have a case in point. A patient received sulfanilamide for a period of six days, a daily dosage of 5.4 Gm. without therapeutic effect. She responded promptly, within a matter of two days, when sulfadiazine was administered following an interval of two days without medication. I have had other comparable experiences.

Sulfathiazole and sulfadiazine are more effec-

tive drugs than sulfanilamide.

Dr. McKeen Cattell: I take it that those cases throw no light on the question of a particular organism acquiring drug-fastness.

Dr. Douglas: I don't believe so. There is the fact that in extensive infection with pyuria an inhibitor, such as para-amino-benzoic acid is present in the urine, and in those instances the drug must be continued for a relatively long period of time. If there are focal abscesses in the urinary tract, the therapeutic response is poor or delayed. I do not believe that our experience necessarily indicates that the organism has become drug-fast.

Dr. Modell: I should like to ask a question along the line of Dr. Gold's. It is accepted that sulfadiazine or sulfathiazole are approximately equally effective in urinary infections. Do you know of cases in which one of these two, either sulfadiazine or sulfathiazole, was not effective and the other was?

Dr. Douglas: I know of instances in which, after the lapse of time, there was response to one drug although there had been no response to the other. I do not believe that answers your question.

Dr. Wheeler: Dr. Cattell, would you say a word about the pyridium-sulfonamide combination? It introduces a new point of view.

Dr. Cattell: That has been a subject of recent interest, arising from the observations of Neter, who observed in test tube experiments that a combination of pyridium with the sulfonamides, both at subeffective concentrations, will destroy the organism. Incidentally, it should be mentioned that the toxicity of the sulfadiazine is decreased by the simultaneous administration of pyridium, and the question arises as to whether that combination might not be more effective in urinary infections. I think Dr. McDermott has firsthand knowledge on that point.

Dr. McDernott: We repeated Neter's work, and in the test tube, with B. coli, a small amount of sulfadiazine when given with pyridium is more effective than that amount of sulfadiazine alone.

That also holds true for pneumococcus type I in the test tube. However, this has not been borne out for pneumococcus type I infection in mice. In other words, in vivo we have not found a synergistic value, nor so far in the patients whom we have studied with Dr. McLellan.

Dr. Modell: Pyridium has practically no bacteriostatic properties in the test tube.

Dr. McDermott: Very little, in the studies which we have made.

Dr. Wheeler: If one looks through the charts from the urology service one notes that most patients nowadays who have an operation for benign hypertrophy of the prostate receive sulfadiazine or sulfathiazole prophylactically. Has that proved to be a worth-while procedure?

DR. McLellan: It should not be given routinely. I think the drug should be given if the urinary tract is badly infected before the operation, along with adequate catheter drainage as indicated. I think the drug is given entirely too often both before and after operation.

DR. WHEELER: Another thing that is being done on the urology service now is to give the patients sulfaguanidine or sulfasuccidine before implantation of the ureters in the bowels. Has that proved worth while?

Dr. McLellan: All the patients have done extremely well, but I attribute the success of the operation to the surgical skill of the resident urologist. No drug will ever make up for incompetent surgery.

DR. WHEELER: Dr. Barr, do you have any comment?

Dr. DAVID P. BARR: I should like to ask Dr. McLellan about the treatment of the "gleet," chronic gonorrhea.

Dr. McLellan: A patient complaining of "gleet" when first seen should be examined by smear and culture to determine whether or not he has gonorrhea. If gonococci are present, good results can be anticipated with sulfathiazole. If it is a case of nonspecific urethritis, routine use of the drug is disappointing. The principal causes of nonspecific urethritis are poor sexual hygiene and stricture of the urethra, in the presence of chronic prostatitis. Prostatitis is prolonged and aggravated by ungratified sexual excitement and by prolonging the sexual act. Most cases of prostatitis give no history of gonorrhea. Stricture of the urethra with associated prostatitis will clear up with dilatation of the stricture. The prognosis is good in nonspecific urethritis, and in the absence of stricture a spontaneous recovery is assured. The most important factor in "gleet" cases is for the physician to be competent to determine whether or not the patient has a contagious disease. This group of patients is very much overtreated. Massaging the prostate, bladder irrigations, and sound treatments are carried to a ridiculous degree, in my opinion. I rarely rub a prostate for therapeutic purposes.

Dr. Barr: In those cases do you find any predominant group of organisms?

Dr. McLellan: It is invariably a mixed infection.

Dr. Barr: And you feel there is no utility in the drugs in those cases?

Dr. McLellan: I feel that the drug is of little value in a case of nonspecific urethritis.

DR. WHEELER: Most general practitioners, including the ones who used to send the cases of "clap" to the urologist, treat them now with sulfadiazine and sulfathiazole. Is that permissible?

Dr. McLellan: Any physician can treat simple gonorrhea, provided he is qualified to make a diagnosis (less than 50 per cent of urethritis cases are specific), to administer the sulfonamide, and to make a test of cure, which means a smear and culture.

Dr. Wheeler: You do not pass sounds?

Dr. McLellan: I do not pass sounds and do not rub prostates.

DR. WHEELER: Should the general practitioner treat a gonococcal urethritis in a female?

DR. Douglas: In the female, of course, gonorrhea involves not only the urinary but the genital tract. I think Dr. McLellan has answered that question. Any person who has the ability to make the diagnosis, can determine the cure, and has sufficient knowledge to direct the sulfonamide therapy could adequately care for these patients.

In my opinion the drugs seem to be a little more effective in the female than in the male. Recently I reported a group of nearly 200 patients in whom the average time for cure with sulfadiazine (cultures were taken every two hours) was during the ninth to the twelfth hour after the administration of the compound. We are treating patients now, experimentally, by administering 8 Gm. of the drug in two doses over a period of only four hours with no therapy thereafter. At the moment, it appears effective.

The average general practitioner not prepared to take cultures for the purpose of diagnosis will miss the diagnosis very frequently. Only one-half as many patients with gonorrhea can be recognized by smears as by cultures, and conversely, only two or three per cent of the patients who cannot be recognized by culture can be detected by smear.

DR. CATTELL: If I understand the position of the urologist correctly, he attributes no part of the curative action of the sulfonamide to its local presence in the urinary tract?

The volume of urine and the pH of the urine would hardly be expected to play a part, nor the combination with pyridium, if we are to attribute the curative action to the concentration in the tissues. Is that your view?

DR. McLellan: Yes, I feel that it is the concentration in the blood and not in the urine.

Dr. Gold: Would you state to what extent you depend on the drug blood levels as a guide to dosage? Do you adopt a routine plan of dosage and simply pursue it until the patient is cured, or do you take frequent blood levels and aim to attain a particular level as a means of insuring a cure?

Dr. Douglas: Our practice is to start the average patient with a dosage of 6 Gm. per day and to continue the medication for not longer than six days. If a therapeutic effect is not obtained within six days, I do not believe it does any good to continue it longer.

I think the dangers associated with the administration, in the way of toxic effects, can be greatly reduced if one does not prolong the administration over a period of longer than six days.

We obtain concentrations in the blood and urine every second day and, in some instances, daily. That is done for purposes of evaluation and may not be necessary in the average patient. However, as I stated previously, if we have a patient who has some impairment of renal function, it becomes of great importance to have that information.

DR. CATTELL: But you do not use it in connection with the adjustment of dosage for the therapeutic action?

Dr. Douglas: No.

Dr. Barr: Helmholtz has emphasized that very small amounts of sulfonamide may be effective in pyelitis. Have you had any experience with small amounts; that is, have doses of less than 1 Gm. a day an effect? I believe that is what they were.

Dr. Douglas: I think it is interesting, in connection with Dr. Barr's remark, that Kenny, who was associated with Colebrook at the time the original work was done at the Queen Charlotte's Hospital, advocated 0.5 Gm. three times a day. That would be 1.5 Gm. per day. That may be effective in a very mild type of urinary tract infection—one that involves little or no pathologic or anatomic change.

Helmholtz is quite correct in the statement that small doses have bactericidal effect. He recently advocated 0.5 Gm. a day, but that is entirely ineffective in a patient who has anything approaching a serious urinary tract infection. In our experience the dosage employed and advocated by Kenny was entirely ineffective.

In answering another question that came up a little earlier, Crabtree, in Boston, has reported spontaneous cures in 65 per cent of women who have had definite febrile phases of urinary tract infection in pregnancy. This fits in exactly with

our own experience of the presulfonamide days. Spontaneous cures often occur, but, as Dr. Mc-Lellan said, if there is a residual urine or an abnormal urinary tract, such cures do not usually take place at the end of four months. In my opinion, Kenny was evaluating a number of spontaneous cures.

In evaluating a combination of sulfathiazole, or sulfadiazine, or any other drug, one has to take into consideration not only the infecting organism, but the degree of the infection. This makes such an evaluation very difficult.

### Summary

DR. Gold: The treatment of genitourinary infections has made considerable advance in recent years. The role of so-called urinary antiseptics has been better defined. Very few drugs have established for themselves an important place in this field. The multitude of dyes which color the urine seem to be of little value. Emphasis is placed almost exclusively on mandelic acid and the sulfonamides. Of the latter, sulfadiazine and sulfathiazole are the most effective members and sulfadiazine appears to produce less distressing side-effects.

Fluids are no longer restricted when the sulfonamides are used in urinary infections because the main action of these drugs is exerted by the concentration in the blood and tissues rather than by that in the urinary passages. Emphasis is now placed on the liberal intake of fluids.

Practically all common varieties of organisms found in urinary tract infections respond to the sulfonamides, except proteus, nonhemolytic streptococcus, and tubercle bacillus.

Urinary tract infections respond to smaller doses of the sulfonamides than many other conditions. For gonorrhea, the practice here is to give from 4 to 6 Gm. daily for five or six days in the average uncomplicated case. The sulfonamides are not very useful in nonspecific urethritis. In mild cases of pyelitis smaller doses suffice.

Calcium mandelate is employed in doses of 12 Gm. daily with limitation of the urine output to about 1,200 cc. In the case of this drug it is imperative to maintain the pH of the urine at 5.5 or less, with a suitable acidifying agent.

There is more information about the natural history of urinary infections. It is pointed out that in uncomplicated cases a large proportion of urinary infections tend to clear up spontaneously. It is further pointed out that in the presence of pathology obstructing the free flow of urine it is virtually impossible to sterilize the urinary tract by means of drugs. The pyuria may subside temporarily but it recurs.

The improvement in the outlook for patients with urinary infection depends in a large meas-

ure on the utilization of the foregoing facts and the improvement of surgical technics for correcting obstruction to flow. It is strongly urged that traumatization of the urinary tract should be avoided. Dr. McLellan states that he now rarely passes sounds or massages prostates in these

The importance of several diagnostic measures, namely, the intravenous pyelogram, the smear, and the culture, have been discussed. The general practitioner may handle urinary tract infections if he is equipped to establish the diagnosis. to administer the sulfonamides, and to make a test of cure. which means a smear and a culture.

## HOLLAND'S HEALTH CRISIS

Long after the Nazis are driven out of Holland. the effects of their occupation will be painfully evident in the lowered physical condition of the populace. The toll exacted by German looting of foodstuffs, by medical neglect, drug shortage, and mass migrations is evidenced in the appalling public health statistics contained in a secret document, which was smuggled out of the country only a few weeks ago.

Their data reveal that the general death rate increased from 8.6 per 1,000 in 1939 to 9.5 per 1,000 in 1942. Infant mortality is even more serious; in 1939 the rate was 34 per 1,000; in 1941, only one year after the German invasion, it had advanced to

43 per 1,000.

Increased prevalence of a nation's tuberculosis is an indication that its people are not getting proper shelter, food, and medical attention. Last year's tuberculosis statistics from Holland reflect just such a situation. Deaths from this disease increased nearly 100 per cent, from 41.2 per 100,000 in 1939 to 80.7 per 100,000 in the spring of 1943. Furthermore, investigations undertaken in 1942 by the Central Bureau of Statistics revealed that 20,000 more cases required sanatorium treatment that year

than in the preceding twelve-month period.

Rickets is another disease which results from malnutrition, and is caused by lack of food containing vitamin D; it has been established that only one Dutch child in three receives this vitamin in normal amounts. In one hospital alone, eleven out of forty child patients had rickets, which was vir-

tually unknown in prewar Holland. Some infectious diseases have shown an alarming increase. Scarlet fever cases jumped from 7,197 in 1941 to 23,000 in 1943. Diphtheria, which had averaged little more than 1,270 cases in 1938 and 1939, increased to 19,400 cases in 1942, with 40,336 cases reported during the first ten months of

1943.

The health crisis becomes even more manifest upon examination of the general food situation. Last November, the Dutch medical delegate to the United Nations Relief and Rehabilitation Adminis-United Nations Reflet and Reministration Administration conference at Atlantic City, stated that the caloric content of Holland's weekly ration for April, 1943, was 32.6 per cent below standard; animal protein, 62.8 per cent; calcium, 57.7 per cent; phosphorus, 57.7 per cent; vitamin A, 85 per cent; vitamin D, 96 per cent; and vitamin C, 37 per cent; vitamin D, 96 per cent; and vitamin C, 37 per cent. This means that the Dutch people are not consuming sufficient milk, bread, butter, meat, cheese, sugar, vegetables, oranges, lemons, and eggs.

This state of affairs has led Dr. Christian Goette, head of the Dutch-Nazi Medical Front, to company the state of the population of the population.

ment: "In regard to the general health of the popu-

lation, it must be said that resistance has been decreased as a result of the long duration of the war and that the number of infectious diseases has increased. This applies particularly to venereal diseases and tuberculosis. I wish it were possible to improve the nutrition of our youth, because undernourishment is spreading."

The health of Holland's people is further endangered by serious shortages of drugs, hospital facilities, and nurses. At the end of 1942, the country's chief health inspector issued a list of sixty-seven medicinal preparations of which there was a scarcity. These included boric acid, cocaine, caffeine, strychnine, castor oil, bismuth prepara-tions, aneurine, camphor, iodine, calomel, chloroform, codeine, pyramidon, gold preparations, morphine, opium, liquid paraffin, and cardiasol.

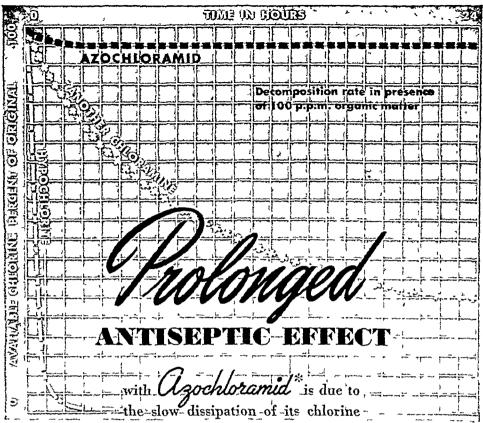

An added blow fell with the "unexpected" dis-

appearance last year of Holland's insulin stocks. Total consumption of the drug had to be halved. By the middle of February the supply to patients whose quota had been 20 units was cut off altogether; serious cases were compelled to manage on small quantities. Until the end of last year insulin could still be bought in the black market at five times the normal price. Many diabetes sufferers were, however, forced to resort to methods used prior to the discovery of insulin—among these is the "hunger cure," which, according to the secret document, is a potent means for fighting complica-

The spread of disease coupled with Nazi requisitioning of Dutch hospitals for German wounded soldiers has created another serious health problem. Last February, Amsterdam Hospital had a waiting list of 2,348 people, many of whom were urgent surgical cases. To make matters worse, the Germans also requisitioned 6,000 hospital beds in northern and northeastern Holland, at a time when mass evacuations from the coastal regions to those areas were under way. Among the evacuees were many aged and infirm who were in desperate need

of hospitalization.

A further complicating factor is the shortage of trained medical personnel-physicians and nurses. Doctors who have not gone underground or been deported are terribly overworked. Owing to the disorganization of the universities, the usual quota of 330 medical graduates was not filled last year, so that an added burden was thrown upon the older practitioners. Consequently, when the Germans made preparations to transfer 1,500 doctors to the Raigh the Dutch physicians threetened to Reich, the Dutch physicians threatened to go on strike, and, for the time being at least, the matter was dropped.—Release from the Netherlands Information Bureau

content. Thus, it provides a sustained antiseptic action—reducing frequency of dressings (and accompanying trauma) and resulting in conservation of time on the part of medical attendants.

### PHYSICIANS' HOME, INC.

"Twenty-Five Years of Service"

N THANKSGIVING DAY, 1918, there was brought to the attention of the late Dr. Wolff Freudenthal the economic disability of an elderly physician who at that time was an inmate of the poorhouse. Dr. Freudenthal brought this sad case record to the attention of a group of physicians at one of the meetings of the Medical Union. It was the sentiment of the members of that organization that it was opportune to create, maintain, and minister to the aged and infirm physicians, their wives or widows, and to make such assistance feasible in other and related ways.

A committee was appointed to survey the situation and to put into practical effect this altruistic idea. Under the chairmanship of Dr. Freudenthal application was made for incorporation under the title of The Physicians' Home and the certificate of incorporation was granted on June 4, 1919. It is interesting, in retrospect, to recall the names of the proponents of incorporation: Drs. Daniel Cook, Warren Coleman, Max Einhorn, Wolff Freudenthal, Silas F. Hallock, Graeme Hammond, Francis Huber, Robert T. Morris, Alexander Trautmen, Henry Mann Silver, George Steel, Ralph Waldo, Albert G. Weed, John E. Welch, Mr. Stuart G. Nelson, and Justice Bartow S. Weeks.

A constitution and bylaws were formulated, adopted, and the following officers were elected: Dr. Robert T. Morris, president; Dr. Ralph Waldo, vice-president; Dr. Silas F. Hallock, secretary; and Dr. Albert G. Weed, treasurer.

In the fall of 1919 an appeal was made to the members of the medical profession, soliciting donations for this purpose. The response upon the part of the profession was spontaneous and gratifying, and funds began to be accumulated.

The first guest of the Physicians' Home was sent to a Home for the Aged at Amityville, New York, and this Home was utilized throughout the succeeding years until 1923. In 1922 the late Dr. Stephen B. Mountain, of Olean, New York, offered to the Physicians' Home a house and farm at Caneadea, New York. It was stipulated in the transfer that the Physicians' Home should make certain installations and carry out certain provisions for the maintenance of the property. Dr. Mountain was elected director and acted in the capacity of resident manager for the Physicians' Home. In 1923

all of the guests of the Physicians' Home were transferred to the Home at Caneadea. This location did not prove satisfactory. The distance from New York City at the eastern end and Niagara Falls at the western end proved a hardship for many of the guests, together with the fact that the Home was two and a half miles from the nearest railroad station. The high cost of maintenance, together with the demise of Dr. Mountain, made it incumbent upon the directors to return the property to the estate of the late Dr. Mountain. The guests, who had varied in number from three to eleven during this period, were later lodged in the Jackson Hotel at Dansville, in Amityville, and a few at Dr. Barnes' Sanitarium in Connecticut. Through the years the number of guests has varied from four to fourteen and there has at all times been a waiting list.

Since the original incorporation the officers have been: presidents—Drs. Robert T. Morris, Warren Coleman, Chas. Gordon Heyd, and George Kosmak; vice-presidents—Drs. Ralph Waldo, William H. Dieffenbach, Warren Coleman, and Silas Hallock; secretaries—Drs. Hallock, Albert G. Weed, Edward C. Cunningham, Arthur L. Sherman, J. J. Eller, W. Bayard Long, William L. Wheeler, Jr., and Beverly Chew Smith; treasurers—Drs. Albert G. Weed, Edward C. Cunningham, Arthur L. Sherman, and B. Wallace Hamilton.

On April 15, 1936, it became necessary to make certain changes in the constitution and bylaws and in the certificate of incorporation for the purpose of creating a more systematized organization and the name was changed to the Physicians' Home, Inc. The finances of the Physicians' Home at this time were somewhat chaotic and consisted of some dubious assets in the form of real estate in Brooklyn. It became necessary for the organization to divest itself of these dubious assets and to confine itself primarily to a fiduciary organization for the purpose of insuring the maintenance of the aged and infirm physicians and their wives or widows.

The funds of the Physicians' Home were originally derived from contributions from five types of membership: annual members, \$10 or more; sustaining members, \$100 to \$1,000; life members \$1,000 to \$5,000; patrons, \$5,000

# BALANCED PROTECTION, PLUS Lower Cost TO YOUR PATIENTS

Your patients can now obtain Kapseals Abdec at *substantially lower costs*, brought about by new reduced prices now in effect.

Each highly potent, small-sized, hermetically-sealed Abdec Kapseal represents a balanced and comprehensive formula designed to furnish adequate daily requirements of needed vitamins:

Vitamin A	•	5000 Units
Vitamin D		500 Units
Vitamin B <sub>1</sub>		2 mg.
Vitamin B <sub>2</sub>		2 mg.
Vitamin B <sub>6</sub>	•	0.25 mg.
Pantothenic Acid (As the Sodium Salt)	•	3 mg.
Nicotinamide .	•	10 mg.
Vitamin C		75 mg.

Kapseals Abdec\* are supplied in bottles of 25, 50, 100 and 250, with the larger sizes offering your patients worthwhile additional savings in cost per Kapseal.

## PARKE, DAVIS & COMPANY DETROIT 32, MICHIGAN

[Continued from page 1024]

to \$10,000; benefactors, \$10,000 or more; annual and sustaining members were placed upon a yearly basis.

The income received from these types of members was augmented by donations from officers, trustees, interested lay persons, and through bequests by will. The usual form of bequest, which has been used in all of our public announcements, is as follows:

"I give and bequeath to the Physicians' Home, Inc., incorporated, in the State of New York, June 4, 1919, the sum of.......

"Please make checks payable to Physicians' Home, Inc., 52 East 66 Street, New York, New York."

At the present time we have approximately four hundred members in the various categories who have made possible the maintenance of this organization. In addition, we have received substantial aid from well-wishers of the organization in the form of specific bequests, the most recent one from the estate of Annie Van Horne Nelson for \$25,000.

On many occasions various subdivisions of the Woman's Auxiliary of the Medical Society of the State of New York have made noteworthy contributions.

In 1936 it became evident that the Physicians' Home should be an integral part of the organized medical profession and overtures were made to the House of Delegates of the Medical Society of the State of New York whereby the Council of the Medical Society submitted a list of names for directors of the Physicians' Home, since which time the board of directors have been selected from a list of prominent physicians sent from the Medical Society of the State of New York. Recently we have elected Mrs. E. A. Griffin as a director, representing the Woman's Auxiliary of the Medical Society of the State of New York.

It was apparent that a more secure and uniform source of income was necessary, and in 1940 the House of Delegates of the Medical Society of the State of New York permitted the component county societies to add to their statement of annual dues an extra line requesting a voluntary assessment of \$1.00, so the Medical Society would send with its annual statement of dues a memorandum-"Physicians' Home, Inc., voluntary assessment, \$1.00." It was most gratifying and in a measure surprising that 33 per cent of the physicians of the Medical Society of the State of New York responded by returning one dollar to the Physicians' Home, Inc. As evidence of the good will of the various component societies there is subjoined here a statement of

the contributions of the individual county societies for two successive fiscal years, 1942 and 1943.

We take the opportunity at this time, collectively and individually, of thanking the donors for their very great help in our undertaking.

The Physicians' Home, Inc., distributes its funds in a number of ways:

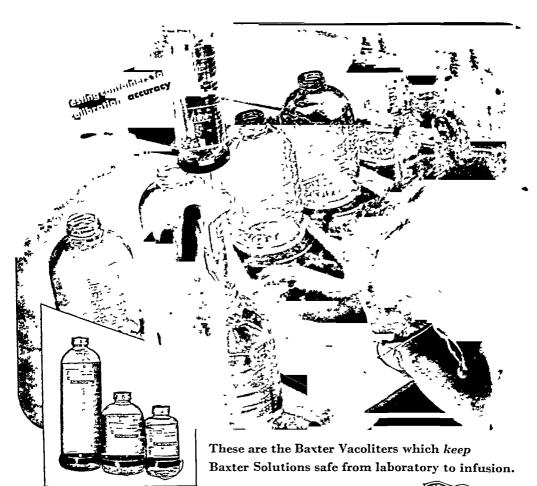

1. Makes an outright contribution of a fixed sum of money. From time to time there arises a situation that demands immediate help—payment of rent, institutional care, or railroad transportation to the family home in a distant state. The Physicians' Home undertakes to provide railroad accommodations and to see that he is comfortably and safely returned to the

care of the family.

2. Makes monthly donations of a fixed sum of [Continued on page 1028]

money to assist in the maintenance of a doctor and his family in their own home. For instance, Dr. B. at the western end of the State is retired from practice, owns his own home, but finds that his income is insufficient to meet expenses. The Physicians' Home makes a monthly donation of cash in order to preserve the home, self-respect, and maintenance of the physician and his family.

- Pays for the maintenance and from time to time supplies small amounts of money to retired physicians who desire to live in their own community. The Physicians' Home makes a survey of the situation through the local county medical society and then remits monthly to the treasurer of the local county society sufficient funds to maintain the individual. The money comes from the Physicians' Home but its distribution is in the hands of the local county medical society.
- 4. Makes cash payments for the maintenance of retired, dependent, and infirm doctors in established nursing homes or sanitaria. The doctor, or, as we prefer to call him, "our guest," makes his own selection of the locality in which he wishes to live and arrangements are made for his maintenance, together with a certain amount of spending money, clothing, and, occasionally, a radio set.
- 5. Gives cash benefits when the total income of the children or family of a retired or infirm physician is insufficient to maintain him. After a survey, the situation is canvassed and cash donations on a weekly or monthly basis are provided to meet the requirements for maintenance. Wherever possible our object has been to maintain the doctor in his home, in his community, and among his own friends.

We have utilized the aid of numerous social organizations, social service workers, local county medical societies, and officers of the Woman's Auxiliary of the Medical Society of the State of New York.

The Physicians' Home, Inc., provides for a quiet and dignified burial of deceased doctors when the occasion arises.

The activities of the Physicians' Home, Inc., are available only to bona fide physicians, residents of the State of New York, who have at one time been members of the Medical Society of the State of New York.

The financial condition as of September 30. 1943, is represented by the following balance sheet.

The officers and directors are as follows: president, Dr. Chas. Gordon Heyd; first vice-

## two short cuts in URINALYSIS

### Galatest

DRY REAGENT FOR URINE SUGAR)

Time involved—30 seconds!

## Acetone Test

Time involved - one minutel

Acetone Test (Denco) and its companion product Galatest (dry reagent for urine sugar) simplify "routine" urinalysis.

Acetone Test (Denco) detects presence or absence of acetone in urine in one minute. Color reaction is identical to that found in the violet ring tests. Trace of acetone turns the powder light lavender—larger amounts to dark purple.

### THE SAME SIMPLE TECHNIQUE FOR BOTH TESTS

Color reaction instantly

1. A little powder 2. A little urine

A carrying case containing one vial of Acetone Test (Denco) and one vial of Galatest is now available. Thus is very convenient for the medical hag or for the diabetic patient. The case also contains a medicine dropper and a Galatest color chart. The handy Lit or refills of Acetone Test (Denco) and Galatest are obtainable at all prescription pharmacies and surgical supply houses.

### NEW TREATMENT FOR CANCER OF THE LARYNX

Brig. Gen. Frank T. Hines, Administrator of Veterans' Affairs, has released the summary of a report made to him by Dr. Max Cutler, of Chicago, chief medical consultant in cancer at the Veterans Administration Facility at Hines, Illinois, a suburb

Dr. Cutler's report discussed results obtained from a new method he has employed in treating early

cases of cancer of the larynx at the veterans' hospital and at the Chicago Tumor Institute. The text of the summary is as follows:

"This is a report on 413 consecutive cases of cancer of the larynx observed by the author because of the larynx ob tween January, 1931, and January, 1943. series includes many veterans who have been sent to Chicago from veterans' hospitals throughout the

"These cases were treated by a new method of x-rays and radium (some patients were treated with x-rays and others with radium—a combination is not used) which has been called 'Concentration Radiotherapy.' The treatments are given twice daily. Some patients are treated for eleven consecutive days and others for eighteen consecutive The treatment is based upon a new principle in which the rays are concentrated upon a very small area, the strongest doses being given to the point of origin of the growth, which is the most resistant part and where recurrence is most common.

"When the cancer has advanced beyond a certain stage, cure by this method is not possible and the larynx has to be removed surgically. In early cases, however, this new method has proved to be highly successful. Thus, in 50 moderately early cases, this method resulted in the initial disappearance of the lesion in 40 or 80 per cent of the cases. Twenty-three out of 28 patients treated more than three years ago, or 82 per cent, are alive and free of disease and apparently cured. Approximately half of these patients would have required complete removal of the larynx in order to effect a cure.

"Unfortunately, the disease was early in only out of 413 cases, or approximately 20 per c Thus a reasonable chance of cure at the very ou existed in only one out of five cases. This is a c lenge to the medical profession and to the lait the matter of early diagnosis and a special portunity for leaders in cancer control.

"Since these growths produce early sympto and since most of them grow slowly and alm never spread in their early stages, the opportu for a planned campaign of education in this field

cancer control is indeed unique.

"The majority of cancers of the larynx begir the true vocal cord. Hoarseness is an early syr tom in 95 per cent of these cases. Examination the larynx with a mirror easily establishes the pi ence of a growth on the vocal cord and biopsy spinen readily confirms the diagnosis. It is only evident, therefore, that the problem of laryng cancer hinges mainly on early diagnosis. No fo of internal cancer offers a more favorable opporti hoarseness being such a common symptom asso ated with the presence of a cold.

"A campaign of education should be undertak to acquaint the laity with these facts and the laman should be taught to insist upon a larynge examination, if hoarseness persists longer than to weeks. Theoretically, a combination of early dis nosis and prompt and appropriate treatment shou render cancer of the larynx largely a disease

historic interest.

"The most significant result of this research is tl eradication by means of a new method of radication by means of a new method of radicaterapy of a group of cancers of the larynx so as vanced as to have required complete removal of the larynx and hitherto generally regarded as resistar to radiation and incurable by radiation."

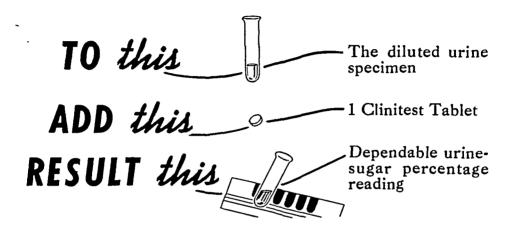

The National Cancer Institute of the U.S. Publi Health Service provided a grant-in-aid to cover par

of the cost of this study.

The potentiation of the central action of phenobarbital by the belladonna alkaloids (Friedberg, Arch. f. exp. P. & P. CLX, 276) renders possible attainment of desired effects with relatively small doses, thus avoiding "hang over" and other unpleasant side-actions. In contrast to galenical preparations of belladonna, such as the tincture, Belbarb has always the same proportion of the alkaloids.

**Indications:** Neuroses, migraine, functional digestive and circulatory disturbances, vomiting of pregnancy, menopausal disturbances, hypertension, etc.

Formula: Each tablet contains ¼ grain phenobarbital and the three chief alkaloids, equivalent approximately to 8 minims of tincture of belladonna.

Belbarb No. 2 has the same alkaloidal content but ½ grain phenobarbital per tablet.

We shall be glad to meet you at our booth 113

### Medical News

### Federal Aid for Communities Needing Medical and Dental Personnel

UNDER the terms of a new Federal statute, Public Law No. 216, the sum of \$200,000 is appropriated to the United States Public Health Service for the fiscal year ending June 30, 1944, for the relocation of private practicing physicians and dentists to areas in which shortages of such personnel now exist.

The act provides that a municipality, county, or other local subdivision of government may submit to the Surgeon General of the United States Public Health Service an application, duly approved by the state health department having jurisdiction over the applicant subdivision, for the relocation of a private practicing physician or dentist. The Surgeon General, on receipt of such an application, is authorized "to enter into agreements with private practicing physicians and dentists under which, in consideration of the payment to them of a relocation allowance of not to exceed \$250 per month for three months and the actual cost of travel and transportation of the physician or dentist and his family and household effects to the new location, such physician or dentist will agree to move to and engage in the practice of his profession for a period of not less than one\_year."

No such agreement shall be made, however, unless the contracting physician or dentist shall be admitted to practice by the state authority having

jurisdiction over the new location.

It is provided further that each applicant subdivision must contribute 25 per cent to the total cost of the relocation allowance, travel, and transportation costs of each physician or dentist, and his

family, obtained by such applicant.

Areas in New York State now in immediate need of additional medical and dental services may apply for the relocation of physicians and dentists under the provisions of this statute. According to the results of a survey made by the New York State Department of Health of the availability of physi-

cians in fifty-four of the fifty-seven upstate counties,\* eight counties (Cattaraugus, Chautauqua, Chenango, Columbia, Orleans, St. Lawrence, Schuyler, and Seneca) on the basis of estimated population had less than one physician per 1,500 persons as of February 1, 1944. At the time of the last survey, April 1, 1943, five additional counties (Allegany, Clinton, Lewis, Montgomery, and Putnam) had less than one physician per 1,500 population. Seneca County continues to have the lowest physician-population ratio, 1:2,049. However, Seneca, like other counties, is served by physicians residing in adjacent sections. The need for physician's services, therefore, cannot be determined on the above basis alone.

More complete analysis indicates that there are twenty-four areas in seventeen counties in each of which there is need for at least one additional physician. In two of these, negotiations are under way which should relieve the physician shortage in the near future. There is need for immediate relocation of physicians to the remaining twenty-two

areas.

Forms for use by subdivisions in making application for the relocation of physicians and dentists have been sent through the district health offices of the New York State Department of Health to the proper authorities of communities deemed to be suffering from a lack of medical services.-Health News, March 27, 1944

### Newburgh-Kingston Caries-Fluorine Demonstration

A LONG-RANGE demonstration which may prove conclusively the practicability of mass protection against dental caries through the simple expedient of adding fluorine to public drinking water supplies will be conducted by the New York State Department of Health with the cooperation of two upstate communities. If successful, this procedure may spell an achievement in dentistry and public health as epochal as the control of many infectious diseases through immunization.

The far-flung implications of this demonstration stagger the imagination when it is considered that today tooth decay is an almost universal disease affecting practically the entire population regardless of age, sex, race, or economic status. Records of the physical examinations of school children reveal that dental caries is the most prevalent defect found. Because of its widespread prevalence and its possible effects on the general well-being of the individual health officials within recent years have treated this disease as a public health problem....

Within recent years, the effects of fluorine on tooth structure have been studied by many investigators. Their observations revealed that in communities where fluorine was present in the water

supply in concentrations of one part per million and over, there was less dental decay than in comparable communities using fluorine-free water. Where the fluorine was in excess of one part per million, there was mottling of the enamel, manifested as white to brown spots, and in severe cases the enamel was However, where there was one part per pitted. million or less, there was no mottling of the enamel. These studies followed three definite lines: (1) the chemical analysis of waters and tooth structure and the chemistry of fluorine; (2) the effects of fluorine in animal experimentation; (3) the effects of fluorine on the teeth of human beings.

The results led to the caries-fluorine hypothesis, which points to an inverse ratio of the number of dental cavities to the fluorine present in the drinking water when the fluorides are ingested during the

years of tooth development ...

The caries attack rates for children born and reared in areas where the fluorine content of the drinking water was about 1.0 p.p.m. and those in comparable areas with 0 0 fluorine were as follows: (1) about six times as many caries-free children in the former areas; (2) about a 60 per cent lower dental

[Continued on page 1036]

<sup>\*</sup> Nassau, Suffolk, and Westchester counties were omitted because of the difficulty previously encountered in determining the number of physicians who actually practice in these counties, and because an earlier survey indicated that a very large number of physicians would have to be withdrawn before an acute shortage of physicians was likely to develop. There is no indication that there has been any such large withdrawal in these counties.

Little Chief Redskin gets Big Itch!

FORAYS into the forests and fields by our own little followers of the Redskin bring them many unhappy meetings with the enemies, RHUS toxicodendron (poison ivy) and RHUS diversiloba (poison oak).

But it isn't necessary for "another redskin to bite the dust." Prophylactic inoculations can prevent most of these annoying attacks that disable so many people during the spring, summer and early fall. And 'tvyot' poison ivy extract not only prevents RHUS dermatitis but produces definite benefits in relieving symptoms in those who have already contracted it. The beneficial results of 'tvyot' extract—both as prophylaxis and treatment—have been proved in clinical tests.<sup>1</sup>

'IVYOL' extract contains purified principles of poison ivy (1:1000) in sterile olive oil. Administration by deep intramuscular injection is relatively painless because of the bland vehicle.

The Mulford Biological Laboratories of Sharp & Dohme developed 'IVYOL' extract, and it is accepted by the Council on Pharmacy and Chemistry of the American Medical Association. It is supplied in packages containing one or four 0.5-cc. vials, each vial representing a single dose.

Sharp & Dohme, Philadelphia 1, Pa.

PROPHYLAXIS: Contents of one vial, intramuscularly, each week for four weeks.
TREATMENT: Contents of one vial, intramuscularly, every 24 hours until symptoms are releved.

1. Kerr, W. H. et al.: Nebr. State Med. J., 26:129, 1941.

POISON IVY EXTRACT (MULFORD)

For the Prophylaxis and Treatment of Poison Iry and Poison Oak Dermatitis.

[Continued from page 1034]

caries experience rate; (3) about a 75 per cent decrease in first permanent molar loss.

The United States Public Health Service has done intensive research along these lines. Dr. H. Trendley Dean, senior dental surgeon, and his co-workers found that concentrations of fluorine not in excess of one part per million are sufficient to protect. the teeth appreciably against dental decay without causing mottling of the enamel. In 1942, the United States Public Health Service indicated in its Manual of Water Standards that the permissible concentration of fluorine in drinking water was one part per million.

For almost two years, the New York State Department of Health has been studying the results of these investigations and has given careful thought to the possibility of using this element in protecting the children of whole communities against the rayages of dental caries by adding it to water supplies which are fluorine-deficient. After study of many areas in this State which might be appropriate for a demonstration of this procedure, Newburgh and Kingston were considered admirably suited as study and control areas respectively. Through the foresight and progressive public health viewpoints of the civic officials, who saw its potential benefits, both cities agreed to cooperate with this Department in determining the practicability of such a measure. demonstration will probably set a pattern which may be followed by other communities in which the public water supplies are deficient in fluorine.

Dental examinations will be made annually of all of the five- to twelve-year-old children in the schools for a period of ten years, by the Associate Research

Dentist of the State Department of Health; the results will be made available to the school super-intendents each year. It will be approximately ten years before the full benefits of the water treatment will be realized. Examinations of salivas of a sample of the school populations will also be made, to ascertain the amount of L. acidophilus present. L. acidophilus counts are reasonably good indices of dental caries activity. In previous studies, where fluorine was found naturally in the drinking water supplies there were decidedly fewer colonies of this organism than in comparable areas free from fluorine. This is explained by the antienzymatic action of fluorine which interferes with the processes of carbohydrate fermentation.

It is also planned to make a pediatric investigation of a sample of the child populations, including a general physical examination, urinalysis, and x-rays of the long bones and centers of ossification.

Newburgh, which has 0.12 parts per million of fluorine in its water supply naturally, will have the fluorine concentration increased to 1.0 part per million..

Analysis of the water for fluorine concentration will be made at both the filtration plant and at the Division of Laboratories and Research of the State Department of Health in Albany.

The addition of fluorine to public water supplies deficient in this element may make it possible to effect mass reduction of dental caries at nominal cost and in a very simple manner. By treating drinking water with minute quantities of fluoride salts, the public may receive daily protection against this disease without even being aware of it. - David B. Ast, D.D.S., in Health News, April 10, 1944

### Chace Sees New York as World Medical Center

D. R. ARTHUR FREEBORN CHACE, in his final report as president of the New York Postgraduate Medical School and Hospital, predicted that postwar New York will become a world center for advanced medical training, taking the place of the famous prewar clinics of Paris, Berlin, and

Dr. Chace, president of the New York Academy of Medicine, made this prediction in the annual report for 1943 of the Post-Graduate Medical School and Hospital. Dr. Chace resigned as president in January, after serving fourteen years, and was succeeded by Edgar H. Boles. Dr. Chace is continuing as a member of the board of directors.

Dr. Chace called attention to the report of Dr. Willard C. Rappleye, director of the Post-Graduate Medical School, announcing that physicians from thirty-eight states and one territory of the United States and from twelve foreign countries enrolled last year for postgraduate training.
"We have every reason to believe," Dr. Chace

continued, "that after the war medical men of all the world will look to America for leadership.

"Particularly, the republics of Central and South America and the West Indies, deprived of the clinics of Paris, Berlin, and Vienna, to which they formerly went for advanced study, will turn to New York in search of medical training. Thus an York in search of medical training. extraordinary opportunity and momentous responsi-bility now confront all the medical schools in New

York City, and especially the Post-Graduate. "Postgraduate medical training is becoming more popular daily and the public is far more interested in the making of better doctors than in graduating more doctors. The whole plan of medical education is being revolutionized to meet two important changes: first, the rapid advances in medical science, second, the fundamental change in our social atti-

tudes. "These changes mean that the Post-Graduate Medical School will have a larger and more important place in the educational system of the future."

### Annual Tuberculosis Conference May 24-25

THE annual conference and business meeting of the State Charities Aid Association states I the State Charities Aid Association state and local Committees on Tuberculosis and Public Health will be held at the Hotel Commodore in New York City on Wednesday and Thursday, May 24 and 25, with a program of wartime progress in and next steps toward the substantial cradication of tuberculosis and the venereal diseases.

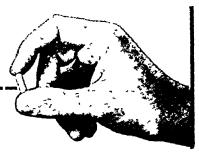

Plans include morning, luncheon, and afternoon sessions, with ample opportunities for participation

in informal round-table meetings by the officer and board-member delegates of sixty-two county and city Tuberculosis and Public Health Associations in the State, outside of New York City.

Also invited to take part in the conference will be representatives of State and local health, welfare, and education departments; sanatorium super-intendents; allied nonofficial health and welfare agencies, and any other interested groups or persons. —S.C.A.A. News, March, 1944

Aluminum Hydroxide Therapy--

Whether ambulatory or not, your gastric ulcer patients will appreciate the ease with which ALUMINOID capsules are taken. Small enough to be swallowed without discomfort, easily carried in vest pocket or purse and, of course, tasteless. It is significant that ALUMINOID offers a true, colloidal aluminum hydroxide powder, which has been shown equally as effective in the control of gastric hyperacidity as this therapy in liquid form. Aluminoid capsules are available through all recognized pharmacies. Information and samples on request.

# MILE APEUTIC TEAMWORK

### Vitamin "B" Complex fortified with Vitamin "C"

Research has shown that vitamins B and C appear to work as a team in effecting beneficial changes in cellular physiology. This was clinically manifested by improvement in pathology of the upper respiratory mucosa and the retina when the two vitamins were given together.

When only one was used, this favorable reaction did not occur.

Vitamin "B" Soluble (Walker) is derived from brewers yeast—its potency increased so that three capsules meet the minimum daily needs for vitamin B factors recommended by the U.S. Government.

Professional samples sent on request to Myron L. Walker Co. Inc., Mount Vernon, New York.

VITAMIN "B" SOLUBLE

[Continued from page 1034]

caries experience rate; (3) about a 75 per cent de-

crease in first permanent molar loss.

The United States Public Health Service has done intensive research along these lines. Dr. H. Trendley Dean, senior dental surgeon, and his co-workers found that concentrations of fluorine not in excess of one part per million are sufficient to protect the teeth appreciably against dental decay without causing mottling of the enamel. In 1942, the United States Public Health Service indicated in its Manual of Water Standards that the permissible concentration of fluorine in drinking water was one part per million.

For almost two years, the New York State Department of Health has been studying the results of these investigations and has given careful thought to the possibility of using this element in protecting the children of whole communities against the ravages of dental caries by adding it to water supplies which are fluorine-deficient. After study of many areas in this State which might be appropriate for a demonstration of this procedure, Newburgh and Kingston were considered admirably suited as study and control areas respectively. Through the foresight and progressive public health viewpoints of the civic officials, who saw its potential benefits, both cities agreed to cooperate with this Department in determining the practicability of such a measure. demonstration will probably set a pattern which may be followed by other communities in which the public water supplies are deficient in fluorine.

Dental examinations will be made annually of all of the five- to twelve-year-old children in the schools for a period of ten years, by the Associate Research

Dentist of the State Department of Health; the results will be made available to the school superintendents each year. It will be approximately ten years before the full benefits of the water treatment will be realized. Examinations of salivas of a sample of the school populations will also be made, to ascertain the amount of L. acidophilus present. L. acidophilus counts are reasonably good indices of dental caries activity. In previous studies, where fluorine was found naturally in the drinking water supplies there were decidedly fewer colonies of this organism than in comparable areas free from fluorine. This is explained by the antienzymatic action of fluorine which interferes with the processes of carbohydrate fermentation.

It is also planned to make a pediatric investigation of a sample of the child populations, including a general physical examination, urinalysis, and x-rays of the long bones and centers of ossification.

Newburgh, which has 0.12 parts per million of fluorine in its water supply naturally, will have the fluorine concentration increased to 1.0 part per million...

Analysis of the water for fluorine concentration will be made at both the filtration plant and at the Division of Laboratories and Research of the State

Department of Health in Albany.

The addition of fluorine to public water supplies deficient in this element may make it possible to effect mass reduction of dental caries at nominal cost and in a very simple manner. By treating drinking water with minute quantities of fluoride salts, the public may receive daily protection against this disease without even being aware of it.—David B. Ast, D.D.S., in Health News, April 10, 1944

### Chace Sees New York as World Medical Center

D. R. ARTHUR FREEBORN CHACE, in his final report as president of the New York Postgraduate Medical School and Hospital, predicted that postwar New York will become a world center for advanced medical training, taking the place of the famous prewar clinics of Paris, Berlin, and Vienna.

Dr. Chace, president of the New York Academy of Medicine, made this prediction in the annual report for 1943 of the Post-Graduate Medical School and Hospital. Dr. Chace resigned as president in January, after serving fourteen years, and was succeeded by Edgar H. Boles. Dr. Chace is continuing as a member of the board of directors.

Dr. Chace called attention to the report of Dr. Willard C. Rappleye, director of the Post-Graduate Medical School, announcing that physicians from thirty-eight states and one territory of the United States and from twelve foreign countries enrolled last year for postgraduate training.
"We have every reason to believe," Dr. Chace

continued. "that after the war medical men of all the world will look to America for leadership

"Particularly, the republics of Central and South America and the West Indies, deprived of the clinics of Paris, Berlin, and Vienna, to which they formerly went for advanced study, will turn to New York in search of medical training. extraordinary opportunity and momentous responsibility now confront all the medical schools in New York City, and especially the Post-Graduate.

ARGYROL THE PHYSIOLOGIC ANTISEPTIC

There are important properties in addition to bacteriostasis which make ARGYROL the "Physiologic Antiseptic"—one which works in harmony with the normal defense functions of tissue, nerves, cilia, and circulatory system. Of first importance is the fact that ARGYROL is both antiseptic and decongestive. But there is an EXTRA FACTOR in mucous membrane antisepsis, in decongestion with ARGYROL. This is physiologic stimulation of tissue defense function. It is a combination of physico-chemical and bacteriostatic properties which go far beyond the usual concept of what an antiseptic should do. Write for further details, posological table and booklet of clinical application.

### County News

### Albany County

In recognition of their services to the war effort in examining selectees at the Induction Center for military service, thirty-six specialists of the medical profession in the Capital District have received medal awards.

Representing the War Department in its recognition of what were described as "outstanding services" was Maj. Joseph J. LaManna of the cavalry, commanding officer of the Induction Center, who presented the awards at the ceremonies in Albany. Assisting were Capt. W. F. Modrys, Marine Corps, chief medical officer; Capt. H. M. Dey, Field Artillery, aide to Major LaManna, and

Lt. (jg) Leonard Hoag, Navy.

Those who received the awards are Drs. Julius Anose who received the awards are Life. Junius Barasch, James W. Bucci, John A. Cetner, Isadore Drapkin, Henry B. Dubins, David H. Faulknor, E. Martin Freund, Joseph A. C. Gabriels, Simon J. Gormley, Arthur F. Holding, Joseph L. Holohan, Julius Katz, Roy C. Kemp, Joseph E. Kilman, Albert LaFleur, Louis F. LeSoine, C. Vaughan Lewis, Edward X. Mikol, Harry Miller, Joseph W. Macre Clarance F. Mullens, John P. O'Keeffe. Moore, Clarence E. Mullens, John P. O'Keesse, Frederick L. Patry, Charles A. Perry, Arthur E. Pitts, Thomas M. Proctor, Alfred E. Rizzolo, William C. Rausch, Rudolph Ruedemann, Jr., William Siegal, John F. Southwell, Francis A. Stephens, Arthur M. Sullivan, Alvah H. Traver, Archibald C. Worth, Jr., and Bascom B! Young.\*

Albany's war front against cancer was opened by the Albany division of the Women's Field Army with a special meeting called by Mrs. Thomas B. Wheeler, new city commander, to formulate plans of the group for an extensive educational campaign against cancer which was launched in April.

Asserting that the best weapon for cancer control was public knowledge of the disease's signs and symptoms, Dr. Louis C. Kress, director of the Division of Cancer Control, State Department of Health, urged that the prime aim of the Women's Field

Army be fully recognized.

"Cancer is a preventable disease," he said. "The public must be posted on what cancer's signs and symptoms are, and to bring that knowledge within reach of everyone, the Women's Field Army has been created."

Also pledging cooperation in the campaign were Dr. F. E. Coughlin, district health officer, Dr. Arthur F. Holding, and Mrs. H. P. Van Wagenen,

State commander.

Planned to function throughout the year on a permanent basis, the city division of the Women's Field Army will consist of a city-wide advisory committee of citizens interested in furthering cancer education, and an executive committee. Announced as members of the latter are Dr. Holding, Dr. John B. Horner, president of the Albany County Medical Society, Dr. Coughlin, Dr. Arthur W. Wright, Dr. I. J. Murnane, chairman of the cancer committee of St. Peter's Hospital, Miss Hazel Reed, director of the Visiting Nurses' Association, Mrs. Augustus Best, of the Albany Training School for Practical Nurses, Mrs. Alfred Madden, Albany County com-mander, and Mrs. James S. Lyons, president of the woman's auxiliary of the medical society.

Local officers of the Women's Field Army are Mrs. Wheeler, commander; Mrs. J. Rooney, Mrs.

\* Asterisk indicates that item is from a local newspaper.

Edward Mertz, and Mrs. Albert Yunich, deputies; Mrs. James B. Lyon, secretary; and Mrs. William McKinney, treasurer. Assistant treasurer for the enlistment drive is Donald Sanders of the National

Commercial Bank and Trust Company.

Eleven Albany physicians and surgeons and four from Schenectady recently took a week's intensive training in preparing civilian doctors for specialized service in civilian or military emergencies. They are members of Affiliated Hospital Unit No. 1 of Albany Medical College, and received the training at Halloran General Hospital, Staten Island.

The group included Dr. J. Lewi Donhauser, unit head, surgeon-in-chief, Albany Hospital; Dr. A. M. Dickinson, chief surgeon, Memorial Hospital; and Drs. J. E. Heslin, chief urologist, Albany Hospital; E. P. McDonald, attending gynecologist, Albany and St. Peter's Hospitals; J. F. Southwell, assistant attending urologist, Memorial Hospital; Fred C. Conway and Raymond F. Kircher, St. Peter's Hospital; Charles A. Perry, chief physician, Memorial Hospital, and F. W. Dodge, attending physician; Arthur W. Wright, chief pathologist, and William P. Howard, chief radiologist, Albany Hospital.\*

### Broome County

The April meeting of the county society was held in the Auditorium of Binghamton City Hospital on April 11 at 8:30 P.M. Dr. Milton G. Potter, of Buffalo, spoke on "Version and Breech Extraction."

At the regular meeting, held February 8, it was voted that each active member of the society not in military service be assessed \$5.00 in order to build up a fund for public relations purposes, particularly involving legislative matters. To date, few assessments have been received. Members are urged to cooperate in this matter.

#### Erie County

Dr. Richard H. Sherwood, of Niagara Falls, addressed the Medical Society of the County of Erie at a stated meeting on March 28 at 9:00 r.m. in the Georgian Room of the Hotel Statler, Buffalo, on "What Niagara County Is Doing to Defeat the Wagner-Murray-Dingell Bill."\*

### Kings County

Dr. Harry J. Greene, associate obstetrician and gynecologist at Kings County Hospital, addressed the members of the Rockaway Medical Society at their April meeting on the subject, "Penicillin in the Treatment of Infections" Treatment of Infections.

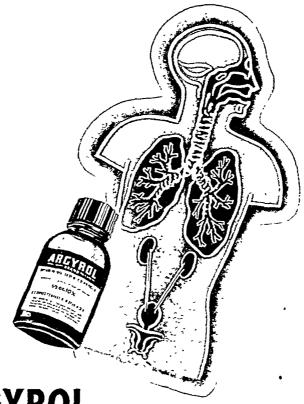

A regular business meeting of the society preceded the talk by Dr. Greene. Dr. Hyman Rivkin, the

president, presided.\*

### Jefferson County

"The British National Health Insurance Scheme" was discussed by Alfred Dinsdale, news analyst, at the regular monthly meeting of the county society on April 13.

[Continued from page 1038]

The place of meeting was the Black River Valley Club, where a dinner was served at 6:30 P.M. preceding the meeting.

On April 2 Dr. Frederic R. Calkins, of Watertown, celebrated the fiftieth anniversary of his graduation from old Bellevue Hospital Medical College of New York, which is now a part of New York University.

### Monroe County

On March 2 the Rochester Democrat and Chronicle

carried the following item:

"In the spotless and well-equipped medical department in the Eastman Kodak Company's plant in Rochester there's a new doctor who not many months ago was held with his family of six in a Japanese prison camp.

He is Dr. Frederick Scovel, formerly of Cortland, who was a mission doctor in China for thirteen years. He returned to the United States on the exchange ship "Gripsholm" last December with his wife and five children. A sixth child was born just

after the ship docked in New York.

"The Scovels were interned in Weihsien, Shantung Province, North China. Dr. Scovel was one of eighteen doctors among the eighteen hundred prisoners."\*

### New York County

An announcement has been made by Dr. Edward M. Bernecker, Commissioner of Hospitals of the City of New York, and Dr. J. A. W. Hetrick, Dean of the New York Medical College, that a teaching affiliation has been established between the City Hospital of the Department of Hospitals, New York City, and the New York Medical College.

According to this arrangement, extensive clinical facilities in medicine, surgery, obstetrics, gyne-cology, neurology, and pathology will now be available to students of the Medical College. hospital is located on Welfare Island, adjacent to the Metropolitan Hospital, which is also used for teach-

ing purposes by the College.

City Hospital was founded in 1832 and has a long tradition as a teaching hospital. From a small institution it has grown into a well-equipped modern hospital with 880 beds, averaging 10,000 admissions per year, with an average stay of twenty-three days. It is an acute-chronic hospital, with approximately 30 per cent of the patients suffering from chronic diseases. City Hospital also maintains jointly with the Metropolitan Hospital an extensive Outpatient Department at 80th Street and East End Avenue.

Dr. Thomas I. Price, medical superintendent of City Hospital, and Dr. W. Laurence Whittemore, chairman of the Committee of the Medical Board,

assisted with the plans for the affiliation.

The following appointments to the clinical faculty

have been made:

Clinical professor of surgery: Frederick W. Bancroft, F. Ward Renfrew, Lyman W. Crossman, Isidore Kross, Kenneth Johnson, James V. Ricci, and Margaret Stanley Brown.

Associate clinical' professor of surgery: John E. Sutton, Alexander Zimany, Henry I. Goodman, Louis Perrotta, Mortimer W. Rodgers, Ernest P. DeSanto, Charles C. Abbate, William S. MacComb, Sigmund Siegel, Max B. Nathanson, Joseph M. Armengol, Chester D. Carroll, Herbath P. H. Walter, Victor Foundation, Occasion A. Desagnation bert E. Hollander, Justus Kaufman, Orestes A. Russo, M. Russell Nelson, Gerard H. Mueller, James P. Boylan, and Herbert J. Simon; clinical assistant in surgery: Harry Zimmerman.

Clinical professor of pathology: James R. Lisa.

Clinical professor of medicine: J. Homer Cudmore, David S. Likely, W. Laurence Whittemore, Charles J. Dillon,

Maximilian A. Ramirez, and John Carroll.

Associate clinical professor of medicine: William Wheeler, Jr., Frank S. Pierson, Seymour Fiske, Benjamin Jablons, Samuel Gellert, Albert Cornell, Ernest Hammerschlag, Walter Bensel, Arthur M. Cahn, Samuel Blinder, Rafael Watter Bensel, Arthur M. Caam, Samuel Binder, Raisel Angel Marin, Richard Gordon, Louis Hirschhorn, Harry H. Shilkret, Harry Gross, William M. Patterson, Martin Kutscher, Harry Katz, Irving Newman, Anibal Zelaya, Frederick M. Allen, James S. Edlin, Carl Reich, Harry Yarnis, Max M. Sterman, Sidney Harris, Robert M. Appel, Sydney Bassin, Cyril Solomon, and Stephen London.
Associate in medicine: Edward A. Stern.

Clinical instructor in medicine: Guenther Elias and Julia Super.

Clinical professor of neurology: L. Vosburgh Lyons and John H. Nilan,

Columbia University, College of Physicians and Surgeons, is offering a full-time symposium on general surgery, May 15-19, 1944. The course is designed to offer a review of recent developments in general surgery, reflecting the experience of representative metropolitan clinics. Meetings will be held at the five participating hospitals under direction of members of the faculty of medicine of Columbia University. The various subjects will be presented by lectures, demonstrations, operative and nonoperative clinics. Although clinical and pathologic aspects will be emphasized, basic anatomic and physiologic principles underlying the subjects under consideration will be discussed.
